Thus, Hindu courts were allowed to adjudicate on family and personal matters, and religious schools and places of worship of different faiths were permitted to be built (sometimes under royal patronage) and to function without hindrance. Some odious customs based on religion were addressed. For example, the practice of *sati* (i.e., self-immolation of Hindu widows in the funeral pyre) was condemned (and only allowed if the widow specifically consented to it), and marriage conventions were overhauled (child marriage was forbidden, and widow remarriage was permitted). Finally, he also eliminated many discriminatory laws and practices. For example, the pilgrimage

Emperor Akbar's Mughal pavilion known as Diwan-i-Khas at Fatehpur Sikri, India. (Cyril Bele)

tax on Hindus and Jains was abolished, the *jizya* (a special tax on non-Muslims) was repealed, and it was possible for people who had been forcibly converted, either by conquest or marriage, to return to the faith of their choice without fear or stigma.

—Ahrar Ahmad

was born in. However, he also continued to offer his prayers according to Islamic custom, the Friday *khutba* (sermon) continued to be read in his name (which indicated that he remained the symbolic leader of the Muslims), and he was not accused of publicly disparaging Islam, the Prophet Muhammad, or the Holy Quran, let alone seeking to displace any of them.

The Din-i-Ilahi was probably inspired by noble intentions, but as an effort at syncretic monotheism, it lacked clarity and coherence and hence failed to leave any substantial imprint on Indian history.

—Ahrar Ahma

Cycles of Tolerance and Persecution under Aurangzeb

Muslim rulers of India, although keen to promote Islam, understood that they could not succeed if the Hindu majority was totally alienated. Although the stridently Sunni imams and ulemas at their courts urged them to strictly enforce Sharia law and to punish Muslim heretics and Hindus, the rulers wisely ignored their advice while showing deference and respect to them. The third Mughal emperor, Akbar (1556-1605), showed the greatest independence of mind in his dealings with Islamic authorities and went a long way toward persuading the Hindus that their religion and culture were safe under him.

➤ BADSHAHI MOSQUE

The greatest architectural monument from Aurangzeb's reign is the Badshahi Mosque (Emperor's Mosque) in Lahore, Pakistan. It is the second largest mosque in the Indian subcontinent. A deep sense of Islamic piety, the vast wealth of his Mughal empire, and perhaps a tinge of jealousy of his father Emperor Shah Jahan's legacy in architecture motivated Aurangzeb to order the building of the mosque some 12 years after he came to the throne. Completed during 1673–1674, it was strategically placed near to the bastion of the Mughal state, the Lahore Fort. During the succeeding centuries the mosque suffered from neglect by both the Sikh rulers of Punjab and the British. After the mutiny the British showed greater care, but it was only after 1939 that proper repairs began. Today it is maintained in a pristine state.

Aurangzeb cared for mosques more than palaces, and this is reflected in the rich ornateness showered on the Badshahi Mosque. The most wonderful floral designs, arches, and motifs are outlined in white marble inlaid into the red sandstone surface of the entire building, while stucco interior reliefs and baluster columns grace the inside walls. The courtyard of 174,900 square feet (16,250 square meters) can hold more than 60,000 people, and the entire structure is built on a raised platform.

—Burjor Avari

Akbar's policy was reversed by his great-grandson Emperor Aurangzeb (1658–1707), who in his desire to appease the theologians (partly perhaps out of guilt for his cruelty toward his family at the time of his accession) turned toward Islamic puritanism and fundamentalism. His mental outlook differed from that of Akbar in matters concerning the role of Islam in the state. Akbar wanted to develop an Indian version of Islam, working in harmony with other faiths of India. Aurangzeb wanted nothing less than an Islamic India, and in order to achieve this he promulgated laws and ordinances that increasingly became unnerving for Hindus as well as for many Muslims. His was a long reign during which repressive laws came in cycles rather than all at once. During some years Aurangzeb

showed the realism of his other peers and moderated his behavior, but he became increasingly intolerant as the years passed.

Aurangzeb's puritanical restrictions first affected those hallowed Hindu traditions at the court that his predecessors had retained as a way of demonstrating their goodwill toward Hindus. The Jharokha-darshan, an ancient ritual in which the monarch appeared on a balcony in front of his people, was discontinued, and the use of Hindu astrologers in making almanacs and fixing auspicious dates for important events was also discouraged. Other restrictions affected both Hindus and Muslims. For example, any outward signs of joyousness and gaiety at various festivals, whether Hindu or Muslim, were strictly discouraged. The great Shia festival of Muharram was stopped, and the lighting of lamps on the tombs of Sufi and other Islamic saints were also banned. Even the average length of a beard was fixed at no more than four fingers. These petty and silly restrictions were born out of a particularly joyless understanding of Islam that Aurangzeb had imbibed from his mentors. On the other hand, while there might have been a rational case for measures such as the prohibition of alcohol, narcotics, and gambling and the restrictions on prostitutes, such measures bore little result in practice.

The two most hurtful measures of Aurangzeb against the Hindus were the reimposition of the *jizya* tax and the destruction of their temples. The *jizya* dates from the earliest days of Islam, and its basic rationale was that a non-Muslim wishing to follow his own religion and to be exempted from war service in a Muslim state and its army had to pay a compensatory tax. This obviously created two classes of citizenship based on religion. Emperor Akbar considered the *jizya* as a discriminatory tax and as part of his vision to establish a Pan-Indian state with fair and equal rules for all Indians abolished it in 1564. Aurangzeb reimposed the tax in 1679 and additionally established discriminatory customs duties between Hindus and Muslims. It may be said, in defense of Aurangzeb, that financial desperation caused by his incessant wars rather than anti-Hindu sentiment might have driven him to levy these taxes. For the Hindus, however, it was like returning to

second-class status in their own land. Again the destruction of some of the most famous Hindu temples at such holy sites as Mathura and Benares and in the Rajput lands was a body blow to Hindu pride and respect. Quite likely Aurangzeb destroyed the temples not out of anti-Hindu bigotry but instead out of a determination to punish defiant Hindu princes, and it is also a fact that he often gave grants for repairing old temples and even building some new ones. Nevertheless, the overall effect of his actions on the Hindu psyche was highly negative.

Aurangzeb's religious fundamentalism stands in contrast to some of the developments that were taking place in contemporary Europe of the late seventeenth century. Certainly Europe had its share of despotic monarchs and religious and political persecutions, but the growth of important intellectual and social movements—Rationalism and the Scientific Revolution (as symbolized by the founding of the Royal Society in England), ideas of liberty and dissidence, and an increasing interest in the outside world—was destined to make the nations of the West the powers of the future. In the same year that Aurangzeb died, 1707, England and Scotland joined up to form the first stage of the United Kingdom. Within 50 years after his death this United Kingdom had won a territorial footing in Bengal, the richest province of the Mughal empire.

The Development of Sikh Syncretic Monotheism

Guru Nanak (1469–1539), the founder of Sikhism, was born Hindu from the Bedi branch of the Kshatriyas in Talwandi in modern-day Pakistan. His ideas are often seen as a hybrid of Hindu Bhakti and Islamic Sufism. Nanak desired to emphasize the inner experience rather than an external religious experience. It is likely that this emphasis was influenced by the Bhakti movement, which spread to northern India from the south. Furthermore, it emphasized the personal response to God by the devotee. Nanak viewed God in monotheistic terms, which would have been a contrast to the polytheism characteristic of many brands of Hinduism and was likely influenced by Bhakti teachings. Nanak understood God as embracing two diverse attributes: transcendent and immanent. God is expressed through different aspects of a single all-embracing concept that includes *sabad* (Word), *nam* (Name), *guru* (Divine Preceptor), *bukam* (Divine Order), *sach* (Truth), and *nadir* (Grace). These are offered by God to man, whose nature is unregenerate. Attaining this leads man to the wheel of transmigration instead of release and salvation. Man is vulnerable to *maya* (illusion) as a consequence of his *haumai* (ego). In the process of seeing the world without *bukam* (fate) is the perpetuation of the transmigratory process leading to a constant separation from God and death. Gobind Singh (the tenth and last Sikh guru) introduced external symbols as a way of distinguishing Sikhs from other religions and signifying the hardening of the boundaries of the *khalsa* (the pure ones). These included the five k's: *kes* (uncut hair), *kanga* (comb), *kara* (steel bracelet), *kacch* (white shorts), and *kirpan* (sword). Nanak's immediate successor was Guru Angad (1539–1552). He was succeeded by Guru Amar Das (1552–1574), who institutionalized the *langar* (community kitchen) and also began organizing the growing Sikh movement into *manjis* (ecclesiastical districts). Guru Ram Das (1574–1581) purchased land that would later become the Harmandir Sahib (House of God). Guru Arjan (1581–1606) is known as the compiler of the Sikh Sacred Text (*Guru Granth*

➤ READINGS FROM THE GRANTH

Guru Arjan (1581–1606) is known as the compiler of the Sikh sacred text, the *Adi Granth* (Original Book). Arjan relied on volumes that originated with his predecessors. The sacred text continued to develop with later gurus until the tenth guru, Gobind Singh, insisted in 1705 that no further gurus would be necessary, and the *Adi Granth* was renamed the *Guru Granth Sahib* (Revered Book Which Is Guru). What follows are excerpts from the *Granth*:

“There is but one God. He is all that is. He is the Creator of all things and He is all-pervasive. He is without fear and without enmity. He is timeless, unborn and self-existent. He is the Enlightener and can be realized by his grace alone. He was in the beginning; He was in all ages. The True One is, was, O Nanak, and shall forever be.” Japji 1, *Adi Granth* 1

“One Creator, One Sustainer, One Destroyer of the World.” Japji 30, *Adi Granth* 7

“The nature of ego is that we act in ego. The bondage of ego is that we are bound to the Round. How, yea, is the ego born? In which way is the Release? Yea, this is the Lord’s Will that in ego, one follows the writ of habit. Ego is a chronic malady: but within it also is the remedy. If the Lord be in Grace, one Practiseth the Word of the Guru. Sayeth Nanak: ‘Hear ye men, thus, yea, is this malady cured.’” Shaloka M.2(2), *Adi Granth* 466

“When one knoweth the One alone as True and obliterates Ego and the sense of otherness, one becometh a Yogi and knoweth the Guru’s Word, and within one flowers the Lotus which illumines one, yea. When one dieth to the self, one becometh a know all; and knoweth within the All-merciful God.” Siddh Gosti 24, *Adi Granth* 940

—David Savalani

Sahib). He is also known as the first Sikh martyr. His successor, Guru Hargobind (1606–1644), shaped the movement along more militant lines. Also, the Akal Takht (seat of temporal authority) is established at the Harmandir Sahib. The Gurdwara (place of worship), also known as the door to the guru, was also a legacy of Hargobind. He was succeeded by Gurus Har Rai (1644–1661) and then Har Krishnan (1661–1664). The ninth guru, Tegh Bahadur (1664–1675), was executed under the orders of the Mughal emperor Aurangzeb. Tegh Bahadur’s son Gobind Singh became the tenth and final guru (1675–1708), who created the khalsa). In turn, he did not appoint a human successor but instead empowered the *Guru Granth Sahib* and the *Panth* (Path) or community collectively to fulfill that function.

The Sikh movement emerged in India during Mughal rule. The Mughals held sway over much of India and therefore over non-Muslim populations. Mughal Islam was the standard utilized by Mughal authorities to determine the credibility and claims of other religions. Some of the gurus enjoyed cordial relations with the Mughal authorities such as Guru Amar Das, who hosted the Mughal emperor Akbar at the langar.

The relationship between the Mughal court and Sikhism was shaped by a policy of tolerance, especially during Akbar’s reign. Sikhism was not anti-Islamic, yet it was opposed to the violence against non-Muslims authorized by some of the Mughal rulers. For instance, Emperor Jahangir used his interpretations of Islam in order to oppress non-Muslims. The first Sikh victim of this was Guru Arjan, who was accused of blaspheming Islam in compiling the *Granth*. The true explanation may be that he had met with the emperor’s rival to the throne; the charges led to his torture and execution. Later, Guru Tegh Bahadur would be executed by Emperor Aurangzeb for refusing to convert to Islam. The Mughal policy of Akbar’s pluralism and tolerance of other faiths had gradually withered. Guru Tegh Bahadur’s decision to protect threatened Hindus shows that his decision to confront the Mughal powers with Sikh soldiers was for the purpose of protecting broader human rights.

The Spread of the (Hindu) Maratha State

During the mid-seventeenth century, Shivaji Bhosle (1627–1680) established the Maratha kingdom in western India. Although it is difficult to characterize Shivaji's kingdom as a formal state polity due to the nature of shifting geopolitical territory and more significantly that of indeterminate sovereignty, it was left to Shivaji's successors to establish formal state institutions and practices of sovereignty from the early eighteenth century until the dissolution of the Maratha state in the second decade of the nineteenth century following British victory in the Third Anglo-Maratha War (1817–1818).

"Maratha" is a historical term of reference for Kunbi-Marathas, lower-caste cultivators who came to be identified as a warrior caste in the Deccan region (or Maharashtra today) in the seventeenth century. From the late nineteenth century, Maratha identity became regionally generalized and referred to linguistic (Marathi) and cultural-geographical identity. Shivaji's effectual challenge to Mughal dominance, his rise to power, and the successive expansion of Maratha rule created one of the most powerful Indian states by the mid-eighteenth century. At its territorial height, the Maratha state reached as far as Bengal in the east, the borders of Mughal India to the north, and Goa and present-day northern Karnataka in the south. Expansion of the Maratha state came at the expense of Mughal rulers and led to frequent military confrontations with other regional powers, such as Mysore, Bijapur, and Hyderabad. The primary tool of state centralization involved military-fiscal patronage, patterned after Mughal land and revenue administration that provided various regional elites grants of land and political status for military service. This patronage system was too weak to consolidate and centralize state power, and by the eighteenth century a number of local Maratha elites, notably in

Baroda, Gwalior, Indore, and Nagpore, established semiautonomous states, creating the Maratha confederacy.

In 1674 Shivaji was crowned sovereign ruler of the territories under his control. He was proclaimed to descend from Rajput Kshatriya (warrior caste) lineage by Gaga Bhatt, a Brahmin priest from Varanasi, thereby legitimating Shivaji's position as *chatrapati* (king). During the brief reign of Shivaji's son Sambhaji (r. 1680–1689), the position of *peshwa* (prime minister), filled by Chipavan Brahmins, came to increasingly wield political power in the Maratha state. By the mid-eighteenth century, the peshwa became supreme leader of the Maratha state, after Shahu (r. 1714–1749), the last descendent of Shivaji, failed to produce a son. During the reign of Peshwa Balaji Baji Rao I (r. 1749–1761) supremacy was short-lived, as the Maratha state devolved into a confederacy of semi-independent states soon after the Marathas were defeated at the Battle of Panipat (1761) by combined forces of Mughal and Afghan armies.

In the face of the division of the Maratha state into semi-independent political constituents, conflict with the British East India Company (EIC) further exacerbated the consolidation of power among the emergent Maratha states. A series of wars between the Marathas and the EIC resulted in the collapse of the confederacy and the continued expansion of British power on the Indian subcontinent. The three Anglo-Maratha wars (1775–1782, 1803–1805, and 1817–1819) were a campaign for dominance between the two strongest military powers in India; British victory in the Third Anglo-Maratha War saw the disposal of the most powerful threat to British colonial expansion in the early nineteenth century. The war was an attempt by the peshwa to reassert his rule against the expanding British power. However, the British soundly defeated the forces of the peshwa and the Maratha states' irregular soldiers (*pin-daris*) in 1818. By 1819 the office of peshwa was abolished, and most remaining Maratha territories were either ceded to direct British rule or placed in a subsidiary alliance system of princely states that acknowledged British paramountcy in the Deccan.

Neo-Confucianism as Ming/Qing Ideology

An efflorescence of Confucianism, now identified as neo-Confucianism, began in the Song dynasty (960–1279) and reached its most influential stage during the Ming (1368–1644) and Qing (1644–1912) dynasties. Political, economic, and social rectitude were these teachings' primary concern, although religious aspects are implied as well in the Neo-Confucian emphasis on properly performed rites as both reinforcement and evidence of the proper relationship between Heaven above and the world below. The relationship between Neo-Confucianism and other philosophical schools and religions was complex. During Neo-Confucian development in the Song dynasty, syncretists generally permitted separate realms to dominant intellectual/religious influences, referred to as the Three Teachings: among the scholars who worked for intellectual/theological reconciliation, Daoism was associated with the organization of the physical world, Buddhism with transcendental elements, and Confucianism with governance and social organization. The degree to which these worldviews were embraced or persecuted at any given time was dictated largely by concerns about ethnicity, political power, and social order.

Strict socio-religious divisions were never the case. Confucianism—with its emphasis on literacy and governance—was generally practiced by the literati, members of the court, and other elites, while the beliefs of Daoism and Chinese (Chan) Buddhism resonated more with

the poor. When ideas or belief systems brush against each other, they generally leave footprints, traces of the exposure, although sometimes the reaction involves militant rejection of the opposing ideas. To maintain a certain level of social stability, it became necessary for Confucians to accommodate aspects of Daoism and Buddhism. This proved particularly difficult with Buddhism, which had traditionally been at odds with Confucianism. Confucians regarded Buddhist monasticism and concentration on the attainment of personal enlightenment through detachment as counterproductive to their own commitment to creating a stable society through the cultivation of personal virtue. Buddhists, in turn, tended to malign Confucianism as simply a temporary solution to worldly, spiritually unimportant problems.

Neo-Confucian accommodation with Buddhism was complicated by the presence of many unorthodox Buddhist sects. By the Ming era, Chinese Buddhism had become so firmly entrenched that splinter groups were viewed with suspicion by both mainstream Buddhists and Neo-Confucians. The White Lotus sect, for instance, was deemed particularly threatening by Neo-Confucians because of its empowering message to the poor and to women. Its adherents had been persecuted since the time of the Mongols, and by the time of the Ming dynasty the sect had morphed into an underground society and an instrument of politico-religious resistance to the established Neo-Confucian order. During the Qing dynasty, the White Lotus Society also advocated a return to Han rule (as its members were ethnic Chinese), putting it in direct opposition with the Manchu Qing. Tensions continued to escalate, culminating in the White Lotus Rebellion of 1796–1804, during which the Jiaqing emperor (r. 1796–1820) followed a course of brutal extermination.

The case of the White Lotus Buddhists helps to illustrate the important role played by ethnicity in determining the degree to which mainstream Neo-Confucianism tolerated other belief systems. When the Manchus overthrew the crumbling Ming state and founded the Qing dynasty, they were faced with the pressing issue of establishing their legitimacy. Viewed as barbarian outsiders by the Han for centuries, the

► THE REVOLUTIONARY TEACHINGS OF WANG YANGMING

In addition to responding to the influences exerted by other religions and philosophical movements in Chinese society, Neo-Confucian scholars had to address divisions within their own ranks. Unorthodox views and interpretations met with stiff resistance, as they represented a threat to the established sociopolitical order.

Such was the case of Wang Yangming (1472–1529), a Neo-Confucian philosopher, statesman, and military leader during the Ming dynasty. Although today considered one of the four most important Confucian scholars (along with Confucius, Mencius, and Zhu Xi), Wang was viewed as a dangerously revolutionary thinker by many of his contemporaries. He challenged the dominant school of Neo-Confucianism at the time, which asserted that a thorough and rational examination of the world was the only means by which to achieve knowledge that could then be used to inform proper action. Wang argued that all individuals were born with an innate and intuitive

recognition of the difference between good and evil, and that it was only through action that one gained understanding. Knowledge was tantamount to action—not a prerequisite for it.

These views were alarming to conservative philosophers, as they suggested that anyone could achieve wisdom via knowledge through action. This upset the traditional social hierarchy by placing the average Chinese peasant on par with—or even above—the more learned scholar, who spent his days in contemplation with little real action. In an attempt to minimize his influence, Wang was sent far from the capital to serve as governor of Jiangxi in southern China. His opponents also attempted to discredit his teachings by claiming that they had been corrupted by Buddhist thinking. Despite such efforts, the number of Wang's followers both at court and within the larger population continued to grow.

—Maxine Taylor

Manchus needed to gain acceptance from the subjects of their now vast domain. To that end, the Manchu rulers of the early Qing dynasty set out to become even more “Chinese” than the ethnic Han. They adopted Neo-Confucianism—the dominant philosophy of the Han elite—and took a hard-line stance on Buddhism and other “foreign” beliefs. As the Qing era progressed, however, and the Manchus became more thoroughly Sinicized, their position softened somewhat.

Neo-Confucians during the Ming and Qing dynasties were also confronted by the religions of the Western world, particularly Christianity. Christianity had been present in China since the seventh century, and its adherents experienced periods of both acceptance and persecution. The late Ming period saw the arrival in China of the first Jesuit missionaries, including Nicolas Trigault and Matteo Ricci. Although their beliefs may have sharply differed from many Chinese beliefs, these missionaries were generally well-regarded. They made an effort to assimilate into the Neo-Confucian-dominated court, wearing the silk robes of the elite and learning to speak Chinese. The Ming were impressed by the

Jesuits' understanding of mathematics, calendrical science, astronomy, gun manufacture, and hydraulics, as well as their skill in translation and diplomacy. Conflicts did arise, however. During the Nanjing Religious Incident of 1616–1622, for instance, a resurgence of conservative Neo-Confucianism led to the expulsion of all Jesuit missionaries from court and a rejection of European science as simply a pale imitation of a superior Chinese model. More liberal Neo-Confucians, however, soon reestablished a strong relationship with the Jesuits.

Although Christian missionaries experienced other reversals of fortune during the seventeenth century, they were generally appreciated by the Neo-Confucian elite of the early Qing dynasty for their usefulness in practical, rather than spiritual, matters. The Kangxi emperor (r. 1661–1722) benefited from the Jesuits' astronomical knowledge, which allowed him to perform his duty of accurately predicting solar eclipses; their experience with European artillery tactics and weapons production, which helped him subjugate rebels on Taiwan; and their diplomatic connections, which resulted

in peace with Russia through the 1689 Treaty of Nerchinsk. In 1692, with prompting from Father Tomas Pereira, Kangxi issued the Edict of Toleration, which legalized Christian missions in China, forbade attacks on Christian churches, and protected the rights of Chinese Christian converts.

In the early eighteenth century, however, a power struggle within the Catholic Church between Dominicans and Jesuits culminated in the Chinese Rites Controversy and a total ban on Christianity in China. The Dominicans argued that traditional Chinese cultural practices such as ancestor worship, offerings for the emperor, and seasonal rites for Confucius constituted idolatry and could not be tolerated among Chinese Christians. The Jesuits, more tolerant of the established cultures into which they inserted themselves, argued that these cultural practices were civic, not religious, in nature. Pope Clement XI sided with the Dominicans, and in 1705 he sent Charles-Thomas Maillard De Tournon to Beijing to communicate the papal ban on the observance of Chinese rites among Chinese Christians. When De Tournon met with Kangxi in January 1707, the emperor was outraged by this affront to Neo-Confucian authority and banished the legate to Macao. On March 19, 1715, Clement formalized the decision in the papal bull *Ex illa die*. In response, Kangxi banned Christianity outright in 1721. Notably, the emperor linked Christianity to the “small, bigoted sects of Buddhism or Daoism.” Although the issuance of the “Plane Compertum” decree by Pope Pius XII in 1939 reversed Clement’s decision, the intervening two centuries of Neo-Confucian hostility toward Christianity had severely weakened the latter’s presence in China.

Kannon and Mary— Two Merciful Mothers

Christianity in Japan was banned for over two centuries during the Tokugawa (Edo) era (1603–1868). The authorities, eager to eradicate this foreign religion, executed and imprisoned thousands of Japanese Christians and ordered all families to register with local Buddhist parishes. To conceal their faith, Christians thereafter pretended to be Buddhist laypeople, yet they secretly maintained their faith with clandestine codes and ingenious adaptations. For example, Christians hid crosses inside Buddhist statues that were used during Buddhist funeral services for deceased family members. To outsiders the memorial image appeared Buddhist, but to the outlawed Christians it doubled as an object of Christian faith. Among some, the tea bowls in the Japanese tea ceremony were turned three times prior to drinking (to symbolize the Holy Trinity), or napkins were folded in a certain pattern to instruct insiders when to silently recite a Christian prayer.

Underground Christians, mostly in the Nagasaki area, also created statues of the Virgin Mary (Mother of Jesus) disguised as the Buddhist deity Kannon (Goddess of Mercy). These images, called “Maria Kannon,” were made or altered to look like Kannon, but they were not worshipped as Kannon. Instead, the Christians venerated these Buddhist statues by silently praying to Mother Mary. Many statues, moreover, had a Christian icon hidden inside the body or camouflaged in the artwork. During the dark years of Christian persecution in Japan, these secretive methods fooled government agents and helped the Christians to keep their faith hidden and alive.

Representations of Mother Mary in the guise of Kannon did not arouse much suspicion, for Kannon (as described in Buddhist scripture) can appear in many different forms, both male and female. Kannon emerged early in the development of Mahayana Buddhist traditions in India, Southeast Asia, China, and Tibet. Originally depicted only as male, Kannon in later centuries reached great prominence in China and then

➤ KANNON, AMIDA, AND HEAVEN

Kannon is worshipped independently in Japan, but she is also closely associated with Amida Buddha, one of the loftiest savior figures in Japanese Buddhism. Amida ("Infinite Life") presides over the Western Paradise. When a Buddhist dies, Amida descends from his paradise to lead the faithful back to his Pure Land of Ultimate Bliss. Kannon is one of Amida's main attendants. In artwork, Kannon is often shown alongside Amida descending from heaven, while solitary statues of Kannon commonly include a small image of Amida in her headdress.

Amida's role as savior, moreover, parallels in part the role of Jesus the redeemer. Not surprisingly, faith in Amida was readily doubled with Christian faith during the anti-Christian persecutions of the Edo era. To avoid suspicion, Christians created Amida images that were mounted on crosses. Their veneration of this Amida cross appeared to outsiders as devotion to Amida, but it also doubled as an article of Christian faith.

—Mark Schumacher

Japan in her various female manifestations: those associated closely with the virtues of compassion, gentleness, purity of heart, and motherhood. In Japan, the three feminine forms of Kannon most related to motherhood are Koyasu Kannon (child giving), Juntei Kannon (pure one), and Jibo Kannon (loving mother). These three are venerated as patrons of easy delivery and childrearing and are often depicted holding a child.

Maria-Kannon statues were commonly made of white porcelain. Most were effigies of the Koyasu Kannon. These sculptures also resembled the popular White-Robed (Byakue) Kannon of Chinese origin but with the deity holding a child. This imagery could easily double for secret veneration of the Virgin and Child. Less common Japanese images of the Kannon showed her nursing a baby. This latter form apparently appeared in the anti-Christian Edo era. It is generally considered Japanese in origin and was supposedly developed to supplant Koyasu-sama, the Japanese Shinto deity (kami) of easy childbirth.

Like Mother Mary in Christian traditions, the female Kannon of Japan embodies the love and compassion of a "mother par excellence." Even today, Kannon remains one of the most widely worshipped Buddhist saviors in Japan and Asia. In China, she is known as Kuan Yin.

Catholic Inquisition

The Inquisition is historically the most reviled and hence misunderstood of all institutions in the Catholic Church. The first step in dismantling stereotypes about the Inquisition is to recognize that there was no single entity known as "The Inquisition." No unified organization

INQUISITION STUDIES

This is an exciting time to study the Inquisition, particularly the Roman Inquisition. After centuries of secrecy, the Congregation for the Doctrine of the Faith opened its archives in Rome in 1998. These archives contain much new material from the Roman Inquisition and nearly complete records from the Inquisitorial court of Siena. The new material includes complete transcripts of many Inquisitorial trials as well as minutes and decrees from the regular administrative meetings of the Congregation for the Doctrine of the Faith. The archives also contain the full archives of the Congregation of the Index, which oversaw Indices of Prohibited Books from the sixteenth century to the mid-twentieth century.

A few important monographs, based previously on inaccessible sources from these archives, have already appeared. It should be noted that the archives are not at all complete and are still largely uncatalogued. Nonetheless, this dramatic event has the potential to influence scholarship in a wide range of fields.

Founded as the Sacred Congregation of the Universal Inquisition, the congregation's name was later changed in the early twentieth century to the Sacred Congregation of the Holy Office and finally to the Congregation for the Doctrine of the Faith. Prior to becoming Pope Benedict XVI in April 2005, Cardinal Joseph Ratzinger was prefect of the Congregation for the Doctrine of the Faith and oversaw the opening of its archives.

—Emily Michelson

possessed a long arm and a mandate to suppress freedom of thought, torture or execute all dissidents, and instill fear throughout its jurisdiction through horrific practices and secret tribunals. Rather, the term “inquisitions” reflects a series of independent procedures intended to address specific perceived localized threats of heresy in Europe between the thirteenth and sixteenth centuries. The most significant of these were the medieval Inquisitions founded in the thirteenth century, the Spanish Inquisition of the late fifteenth century, and the Roman Inquisition of the mid-sixteenth century. While these procedures were sometimes as punitive and cruel as popularly imagined, in many instances they

were often significantly more lenient. The purpose of Inquisitorial procedure at all times was to defend and protect the Catholic community of the faithful from dangerous doctrine and to restore sinners to the Catholic fold.

The papacy established the earliest Inquisitorial courts in Europe in response to growing heretical movements in the eleventh and twelfth centuries, specifically the Cathars and the Waldensians in southern France. The growth of both heretical movements and various procedures to stem them were each, in their own way, contemporaneous reactions to the growing power of the papacy in this era as well as to the centralization and codification of church dogma. Inquisitorial procedure derived from ancient Roman law, but medieval Inquisitorial courts were first established in the 1220s and 1230s. In the early decades their effectiveness largely reflected the interests and zeal of individual Inquisitors, who were often members of mendicant orders. Inquisitorial courts spread throughout Europe, especially France, Italy, and parts of Spain. They were responsible for identifying, prosecuting, and punishing heretics (and later witches), if necessary through execution. Many manuals for inquisitors remain, notably that of Bernard Gui (1323–1324). Records from Inquisitorial proceedings are among the most valuable sources for learning about medieval society.

By the early fifteenth century, the papal-sponsored inquisitions had waned, whether because heretical groups were less active or because secular authorities were better equipped to address them. Between the late fifteenth century and the mid-sixteenth century, however, the Inquisition was revived and reinvented, primarily in two major locations: Rome and, most famously, Spain. Inquisitorial courts were also instituted in Portugal and in the Americas in the sixteenth century. These different Inquisitions functioned independently of one another and had different objectives and rationales.

In Spain and also in Portugal, Inquisitorial courts served primarily to identify *conversos*, Jewish converts to Christianity. Pope Sixtus IV established the Inquisition in Spain in 1478 at the request of the rulers Fernando and Isabel. Its first inquisitor general, Tomas de Torquemada, established the basic procedures and

organization for Inquisitorial courts and earned a historical reputation for cruelty. Its most famous ceremony, the auto-de-fé, was a public recitation of sentences against the accused; it did not include executions.

The Inquisition relied on denunciations from citizens, many of whom believed that conversos were secretly continuing Jewish practices and thus threatening Christian society. The Inquisition in Spain thus resulted from and also perpetuated tremendous anti-Semitic sentiment in Spanish society and also contributed directly to the expulsion of the Jews from Spain in 1492. To a lesser extent, the Spanish Inquisition also prosecuted *moriscos*, or Muslims who had converted to Christianity. The Spanish Inquisition was not substantially involved in witchcraft trials but did take an interest in literature and worked to enforce censorship and expurgation lists. The first 50 years of the Inquisition, from 1478 to 1530, were its most active. By the eighteenth century it was largely inactive and was abolished in the early nineteenth century.

Pope Paul III founded the Sacred Congregation of the Universal Inquisition in 1542 as a response to the Protestant Reformation. The Roman Inquisition, as it is more commonly known, operated entirely separately from other Inquisitions of the same period.

The purpose of the Roman Inquisition was to centralize the process of investigating suspected heretics, principally Protestants. Recent research into surviving Inquisitorial records has demonstrated that contrary to popular opinion, the Roman Inquisition was rarely an instrument of terror. Rather, it built many safeguards into its juridical system, such as the right of appeal, the use of friendly witnesses, and defense attorneys. Most of the time courts chose to employ milder forms of punishment. Sentences of lifetime imprisonment, for example, usually ended after a few years. Capital punishment was rare, and torture was a last resort.

The papal Index of Prohibited Books was first published in 1559 amid much controversy. The archives of the Congregation of the Index were transferred to the Inquisition archives in the twentieth century. During their active phases, the two institutions operated separately.

Witch-hunting in Western Europe

The notorious European witch-hunts, or witch craze, that resulted in hundreds of thousands of deaths of women, men, and children between primarily 1500 to 1650 CE is regarded by historians as a pivotal long-term event that illustrated the anxieties and fears of a society in the process of political, economic, and social transition. The witch-hunts were characterized by false accusations (blaming the accused for anything from bad harvests to impotence), acts of torture to extract confessions, trial by ordeal, and grisly executions by hanging, fire, or drowning

Four English women are hanged as witches, while other women mourn and male officials supervise. The witch hunter at the right is being paid for his work. From a woodcut, 1649. (Stapleton Collection/StockphotoPro)

► TRIAL BY ORDEAL—WITCH-HUNTS AND METHODS OF EXTRACTING CONFESSIONS

A common practice for extracting information from suspected witches during episodes of witch-hunts used by early modern European authorities was the medieval practice of trial by ordeal. Typically, the suspect's arms and legs would be bound, and she would be thrown into a river or other body of water. The logic of this process was that if she was a witch she would float to the top, as she would have to resort to using witchcraft to survive. If she was innocent, she would surely drown. Those who floated would have "confessed" to being witches and would be duly executed. Those who did not were lamented as innocent, and charges would be dropped. Growing skepticism over the practice and its faulty logic would eventually lead to its abandonment. However, other methods of torture, such as the rack, would continue to be utilized to extract confessions of practicing witchcraft, committing adultery with the devil, participating in a Black Sabbath and orgies, and desecrating and blaspheming the church and the deity. Ultimately, by the eighteenth century, there was growing skepticism of torture as a valuable tool for extracting information, as many authorities reasoned that under duress people would say anything.

—Abraham O. Mendoza

by either secular or religious authorities. Moreover, as these were occurring in the midst of the Protestant Reformation and the Catholic Counter-Reformation, religious authorities from all denominations were particularly keen on eliminating the malfeasance of witchcraft from society. In addition, secular authorities and scientific institutions, while adhering to ideals of social progress and the primacy of science, were simultaneously supportive of the elimination of witchcraft from early modern European society. In fact, Protestant authorities were more vigorous in their persecution of witches than that of the infamous Catholic Inquisition, which was more moderate in its methods. Current estimates of total dead from the witch-hunts by historians range from 40,000 to 100,000 across Europe.

Historians of early modern Europe argue that the witch-hunts occurred as a result of

long-term changes across western Europe, particularly in the Holy Roman Empire, Scotland, England, France, and the Scandinavian realms. Bad harvests, the outbreak of disease, economic hardships, and war, which had typically been blamed on other ostracized groups such as Jews, became more and more associated with witchcraft performed by older women, mostly widows and spinsters. The Catholic condemnation of witches through the publication of the *Mal-leus Maleficarum* (1487) compiled by Heinrich Kramer and James Sprenger made demonology a severe offense punishable by religious and subsequently secular authorities. However, once a series of accusations emerged and more confessions were extracted, sometimes by force, more and more people would be accused and would also then name names. Amid these panics, authorities would allow kangaroo court systems to be put in place and further encourage the mob to round up more suspects. In the midst of torture, executions, and ubiquitous paranoia, a single witch-craze episode could take out several hundred people in a given region. Recent studies have illustrated that women of all ages and social class, not just older unprotected poor women, were accused and condemned of witchcraft. Men, while they were persecuted as witches, amounted to a fraction of the total number of women accused and sentenced for witchcraft. These men were also usually related to an accused witch by blood or marriage. The Catholic regions of Spain, Italy, and Portugal also had witch-hunts, albeit on a smaller scale than in Protestant Europe. Since they were under the jurisdictions of their respective national inquisitions under papal authority whose intention was to convert souls, not eliminate witches, they did not devolve into widespread persecutions.

Modern scholars of the European witch-hunts link the prevalence of witch-hunts to long-term transitions in European society in general. Economic growth based on interregional networks, a growing belief in science and progress, and the gradual leveling of society fueled anxiety among the populace, who harkened back to the security of the Middle Ages. Witchcraft, associated with women who did not know their place in society (i.e., widows, poor women, midwives, outspoken women, etc.), was projected

onto any woman who did not fit the prescribed place in early modern Europe. Furthermore, men and children were also subject to persecutions albeit on a much smaller scale. The prevalence of the witch-hunts would finally peter out across much of western Europe in the mid-1700s amid growing skepticism and in the wake of the Enlightenment.

Women in the European Reformation

Women played a significant role in both the Protestant and Catholic reformations, but they suffered a backlash in large part because of beliefs about women's nature and roles that can be traced to early European societies. Women's subordination in the West had been justified by the idea of their inferiority to men, and Protestant reformer Martin Luther, following established Christian traditions, asserted that women were physically, intellectually, morally, and emotionally weaker than men. He emphasized the necessity of women's subordination specifically within marriage, which he encouraged over celibacy for both laypeople and priests. Luther, himself a former monk, married a former nun, Katherine Von Bora, who developed the new role of pastor's wife. According to Luther's concept of "calling," every woman was called to become a wife and mother in a household where her husband was now the spiritual head. Since most women married, the higher status of marriage was a plus for women. However, this emphasis on women's domestic role also supplied an ideology that supported limitations on women's economic opportunities, limitations supported by a lengthy economic downturn that edged women out of urban guilds and even out of workshops. Along

with the moral campaign supported by both Protestant and Catholic reformers, this ideology heightened suspicion of the growing numbers of single women. The effort to close nunneries in Protestant lands sometimes produced more single women in lay society but was often met with resistance, and a number of female religious houses remained open.

Many Protestant and Catholic women became activists for their faith. Luther's ideas that Scripture alone should be the Christian's guide and that every believer is a priest encouraged women to interpret Scripture for themselves. Since faith alone, rather than the sacraments, determined who was saved, a woman was free to decide for herself if her faith had been kindled, if she was among those predestined for salvation, a concept in both Luther's and Calvin's thought. The impact of these ideas on women appears in the lives of activist Protestant women such as Anne Askew, Argula von Grumbach, and Katherine Zell, who challenged the Apostle Paul's dictate that women be silent in the church and whose activism significantly contributed to the success of Protestantism. However, because of the patriarchal belief in women's inferiority, Protestant authorities did not support formal leadership roles for women, and in the long term women's public activism was overridden by the emphasis on their domestic role. Anabaptist women, who supported more radical reform and claimed even greater equality with men in their faith, were those most often martyred for their beliefs.

It has generally been accepted that for Protestant women the deletion of the Virgin Mary and the female saints from churches and devotion was a great loss in terms of both role models and imagining female power. However, in her focus on England Christine Peters has challenged this, asserting that by the late medieval period the Virgin Mary was a model of the suffering Christian for men and women alike rather than a role model for women. In most Protestant lands the option of entering a convent was also lost, although in some Protestant areas religious houses remained open for centuries because of their occupants' determination. While some women entered convents at their families' behest, others chose to live among women dedicated to the

➤ ARGULA VON GRUMBACH

Argula Von Grumbach (who lived approximately from 1492 to 1554 or possibly 1568) was a Protestant noblewoman residing in Catholic Bavaria (southern Germany). She was the first Protestant female writer to appear in print, and she exemplified the radical possibilities of Protestantism and its temporary challenge to patriarchal restrictions. In 1523 and 1524 she wrote seven letters to various authorities, agitating publicly for Luther's Protestant ideas. She was acutely aware of her subordinate status as a woman and defended her speaking out in two ways. In her first letter, to university authorities who had forced a young student to recant his support for Luther, she says that she spoke out because no man had challenged the authorities. She faced a backlash, however, with gendered insults used to attack her. One person wrote that she was "Born a Lutheran whore and gate of hell." A student castigated her for shamelessly forgetting that she was a maid (a

pure young woman) and daring to attempt to teach the authorities. A preacher referred to her as "an insolent daughter of Eve, a heretical bitch and confounded rogue." The authorities apparently left it up to her husband to discipline her, and she may have suffered violence at his hands.

From the beginning, Grumbach cited Scripture as the source of her belief that obedience to God trumped obedience to her husband or the magistrates. This was a revolutionary and empowering idea for women who, like Grumbach, could read and interpret Scripture for themselves (an important part of the Reformation). Grumbach seems to have been silent after 1524, possibly because the German peasants who revolted in 1525 quoted Scripture extensively to justify their demands. This may have increased the danger of a woman's using Scripture to challenge male authorities.

—Martha Skeeters

service of God in institutions that sometimes provided education and always were an alternative to marriage.

Catholic women demonstrated their commitment to reform and their opposition to Protestantism by organizing both lay and religious orders to serve the poor and the sick and to teach. Successful efforts such as Angela Merici's Company of St. Ursula and Isabel Roser's female Jesuit order, however, were denounced by the Roman Church's Council of Trent (1545–1563), which ordered the reclaustration of female religious. Later, the controversial English Catholic activist Mary Ward (1585–1645) was disparaged as a "Jesuitress" by conservative Catholic clerics for her successful missionary and educational work.

Both the Protestant and Catholic reformations also contributed to the eventual increase in the number of women who were accused of witchcraft in part because of the reformers' emphasis on the Devil, which increased fear. Believed to be weaker and more sensual than men, women were thought more likely to succumb to the Devil's wiles and serve him as witches. The reformers' moral campaign emphasized a sense

of sexual sin that was reflected in witchcraft charges against women. This fueled the rise of witchcraft trials in Europe and later North America in the 1600s.

Defining the Limits of Toleration in Post-Reformation Europe

The intellectual and social climate that followed the Protestant Reformation in early modern Europe did not foster a spirit of toleration or the peaceful coexistence of diverse belief systems. Rather, intolerance was further inflamed amid tensions between the multiple Protestant creeds and the resurgence of Catholicism in the form of the Counter-Reformation. Political affiliations came hand in hand with religious association, triggering multiple conflagrations such as the Thirty Years' War (1618–1648). Science and technology progressed during this period, yet unexplained events still were credited to witchcraft, leading to murderous witch-hunts. These attitudes applied within both Catholicism and Protestantism and extended to non-Christians, especially Jews and Muslims, illustrating the level of intolerance that characterized early modern Europe during the centuries following the Reformation. In the aftermath of the chaos and carnage of the mid-seventeenth century, skeptics began to question the irrational nature of much of the prejudices and fears prevalent in European society, contributing to the development of the eighteenth-century intellectual movement historians have called the Enlightenment.

The schism between Catholicism and Protestantism following Martin Luther's break with the Church (1517) provoked intense disarray in the political arrangements of early modern Europe. German Lutheran princes, French Huguenot lords, and British Puritan gentry used the discourse of religion to rationalize their political choices in confronting the power of their respective overlords. The various wars of religion that erupted as a result of this phenomenon were characterized by years of bloody conflict and violence. The Thirty Years' War fought by the Catholic Habsburgs against Lutheran rebel princes turned into a European fratricide that included all the major powers. However, what had begun as a fight between Catholicism and Protestantism resulted in a war against Habsburg supremacy in central Europe, illustrating a tendency to appropriate religious tensions to serve political ends.

The multiple denominations that subsequently followed Luther's break with Rome, in

the form of Calvinism, Anabaptism, and other sects, created myriad new faiths resisting Catholicism and each other. In some instances, Lutherans hated Calvinists more than Catholics and vice versa. While Lutheran princes looked at Calvinists and other Protestant groups with contempt and enacted forms of mild persecution, Catholics continued to persecute Protestants in their lands, culminating in the St. Bartholomew's Massacre (August 25, 1572) in which the Huguenots of Paris were killed by Catholic mobs. After the Reformation the secular authorities in various Protestant principalities and territories throughout Europe assumed the legal authority that they had wrested from the Catholic Church and former Catholic monarchs. Meanwhile, the Catholic Church was utilizing the Inquisition in order to root out heresy and combat Protestantism, having developed in Spain as a means of cleansing the Catholic kingdoms of Jews and Moors in the fifteenth century. Simultaneously, secular Protestant political entities pursued their own persecution of clandestine Catholics in Protestant areas. In England, Catholics were generally scorned and removed from offices of the state and subject to mild levels of persecution. In particular, official state persecution of Catholics in the reign of Queen Elizabeth II followed the death of Catholic Queen Mary, who had persecuted Anglicans during her own reign. Anabaptists were alienated and disliked by other Protestant sects anywhere they happened to emerge. The interfaith bickering that resulted among the various Protestant creeds had the ironic result of prompting many to return to the Catholic fold, particularly around Calvin's Geneva where Swiss towns saw Calvinism as much too constricting of their social lives in regard to alcohol, festivals, and feast days.

The intolerance of the Protestant sects toward each other and toward Catholicism intensified the persecution of people deemed as heretics or witches. The infamous European witch-hunts between 1500 and 1700, in particular, illustrate the severity of intolerance throughout both the Catholic and Protestant domains. Social outcasts, usually women, denounced and accused by neighbors, would usually be rounded up and tried as witches. Official persecution of witches in both Catholicism and Protestantism

➤ MARTIN LUTHER, EXCERPT FROM *THE JEWS AND THEIR LIES*, 1543

Martin Luther, known for his dissension from the Catholic Church and his establishment of Protestantism, published some vehement attacks on Jews, another example of the level of intolerance that existed in the centuries after the Protestant Reformation. This excerpt illustrates how religious intolerance was not unique to the Catholic Church of early modern Europe.

“What shall we Christians do with this rejected and condemned people, the Jews? Since they live among us, we dare not tolerate their conduct, now that we are aware of their lying and reviling and blaspheming. If we do, we become sharers in their lies, cursing and blasphemy. Thus we cannot extinguish the unquenchable fire of divine wrath, of which the prophets speak, nor can we convert the Jews. With prayer and the fear of God we must practice a sharp mercy to see whether we might save at least a few from the glowing flames. We dare not avenge ourselves. Vengeance a thousand times worse than we could wish them already has them by the throat. I shall give you my sincere advice:

First to set fire to their synagogues or schools and to bury and cover with dirt whatever will not burn, so that no man will ever again see a stone or cinder of them. This is to be done in honor of our Lord and of Christendom, so that God might see that we are Christians, and do not condone or knowingly tolerate such public lying, cursing, and blaspheming of his Son and of his Christians. For whatever we tolerated in the past unknowingly and I myself was unaware of it will be pardoned by God. But if we, now that we are informed, were to protect and shield such a house for the Jews, existing right before our very nose, in which they lie about, blaspheme, curse, vilify, and defame Christ and us (as was heard above), it would be the same as if we were doing all this and even worse ourselves, as we very well know.”

—Abraham O. Mendoza

Source

resulted in the death of hundreds of thousands of women, men, and children. Famine, disease, and any other sort of calamity that afflicted a local community were typically conveniently blamed on the local elderly widow. A jealous or angry neighbor could denounce anyone, often leading to charges, a trial, and an eventual execution, usually by fire. The widespread witch craze during this period illustrates how Protestant authorities outdid the former Catholic Church in efforts to smite heresy and witchcraft. For example, in predominantly Protestant southwestern Germany, 3,229 witches are estimated to have been executed from 1591 to 1670 under the auspices of secular leaders.

Currents of thought in science and technology as well as politics progressed erratically within Europe's fervent religious intolerance. Scientists such as Galileo Galilei (1564–1642) and Isaac Newton (1642–1727) sought to challenge the Church's traditional insistence on the deity's direct operation of the physical world;

yet even Newton served on a royal commission to suppress witchcraft. Nevertheless, thinkers such as Baron de Montesquieu (1689–1755), René Descartes (1596–1650), and Jean Bodin (1529–1596) questioned the irrational mood of this period and advocated a more moderate course in religious affairs and politics. The emergence of the skeptics and the *politiques* in European intellectual circles openly engaged in extricating politics and society from the intolerance that led to the Wars of Religion, the witch craze, and the persecution of so-called deviants. Critical of the values begat by both Catholic and Protestant politicians, these currents of thought offered new interpretations of political and social structures to avoid the excesses of the post-Reformation period.

The Limits of Enlightenment

The limits of the Enlightenment are best understood in terms of its uncritically held assumptions. In contrasting itself with the “Dark” Ages, the Enlightenment boasted less external control over an individual’s ability to think and develop. The motto of the Enlightenment, given by Immanuel Kant, was “dare to reason.” The Enlightenment also presented itself in contrast to the Wars of Religion that devastated Europe during the late sixteenth and seventeenth centuries, proposing an alternative in increasingly democratic and secular institutions. While there is some truth in the claim that the Enlightenment gave more opportunity to reason without external pressures from tradition and social caste systems, the limits of the Enlightenment can be seen in the ways that its presuppositions kept certain kinds of thinking from taking place.

The first noticeable limiting presupposition is connected to the Enlightenment’s project to overcome religious wars. A number of Enlightenment thinkers attributed the causes of religious war to people’s overly subjective interpretation of divine revelation, or biblical interpretation. Instead, they advised people to view special revelation itself as suspect and to search for what is universal among all humans. Special revelation does not count as universal because it is not available to all humans, and even among those who have access to special revelation, the multiple interpretations keep religion from serving as common ground. This thinking led to the Enlightenment’s preference for natural, as opposed to revealed, religion (religion without the need for scriptures, as was thought at that time to exist among tribal groups). This was noticeable in the transition from theism to deism (belief in a God who creates but does not rule in history, who gives no scriptures and performs no miracles) and then from deism to naturalism. Naturalism serves as a limit to the Enlightenment because it does not recognize as objects of knowledge anything besides the material world.

Another limiting presupposition of the Enlightenment was what it took to be certain. For rationalists such as René Descartes (1596–1650), the starting point was the individual human. However, Descartes did not reckon with the different views of the self found in various worldviews and instead presupposed that the individual exists as a real being (as opposed to the illusory self posited by the Advaita Vedanta school of Hindu philosophy).

Other rationalists likewise failed to recognize the fallacies of their presuppositions and instead assumed that their starting points were common-sense positions.

In contrast, empiricists such as John Locke (1632–1704) asserted that people acquire knowledge first through the sensory evidence. Locke described the mind as a *tabula rasa*, or blank slate, until its interaction with information gathered by the senses. This sense data could be collected and methodically ordered so as to arrive at a scientifically based knowledge of the world. The empiricists encountered two intellectual problems, however: first, inferences drawn from sense data, or inductive reasoning, remains subject to erroneous logic; second, sense data must be interpreted to be meaningful, and the interpretations cannot themselves be derived from sense data without circularity.

The inability of rationalists and empiricists to demonstrate the possibility that we can acquire certain knowledge led skeptics such as David Hume (1711–1776) to argue that certainty is not possible. To respond to this criticism, Immanuel Kant (1724–1804) proposed what he called a Copernican Revolution in philosophy by distinguishing between the noumenal and phenomenal worlds. The noumena (being in itself) is unknowable, whereas the phenomena (being as experienced by humans) is the sole object of knowledge. The human mind structures the phenomena by adding categories such as space, time, and causation, which are not present in being in itself.

Immanuel Kant, eighteenth-century German philosopher. (Library of Congress)

While Kant's intention was to counter Hume's absolute skepticism, his solution in fact undermined the effort to demonstrate that certain knowledge was possible and contained other significant problems. For instance, Kant asserted that noumena influenced the phenomena. Yet if humans cannot directly know being in itself, then they cannot comprehend causation between the noumenal and phenomenal worlds. Therefore, if nothing can be known about the noumenal world, then nothing can be said about it, and concepts such as causation are humanly constructed and thus subject to logical error. However, Kant had a great deal to say about the noumenal world. Kant's distinction between the noumenal and phenomenal is not different than the classical problem between appearance and reality. But this distinction assumes that something can be known of both and that one can be compared to the other. If reality cannot be known, then only appearance can be spoken of, and the problem of appearance and reality does not arise.

These limiting presuppositions and Kant's proposed solution to skepticism provided the basis for a pervasive skepticism that undermined the Enlightenment's goal of attaining the universal and certain. This failure is sometimes thought to prove that the universal and certain cannot be obtained and that instead difference and particularity should be emphasized. However, an alternative possibility is that the Enlightenment did not consistently apply its own principles. As noted above, both rationalists and empiricists imported presuppositions that they did not question. Like the religious factions that the Enlightenment wished to avoid, uncritically held assumptions resulted in skepticism. The solution is to search for the universal and certain at the presuppositional level, asking questions about the most basic issues that can be thought about rather than importing interpretive assumptions.

Superstition and Witch-hunting in Eastern Europe

From 1400 to 1750, eastern Europe underwent a similar phenomenon as that experienced by western Europe in terms of widespread persecutions of witches, warlocks, vampires, and suspected heretics amid the social and economic changes prevalent at the time. Witch-hunts in both Catholic Poland and Hungary, influenced by the ideas of *maleficium* (evil deeds through witchcraft) and demonology from the German lands, were an extension of events going on in western Europe in the late sixteenth century and the seventeenth century. In contrast, Muscovite Russia experienced a surge in witch-hunts just as the phenomenon was on the decline in the rest of Europe, well into the eighteenth century. Moreover, widespread superstition based on local folklore in various regions of eastern Europe, in places like the Balkans, Romania, and Russia, created significant scares surrounding vampires and werewolves. Such local legends and myths explained the unexplainable, particularly events such as death, famines, outbreaks of disease, and other instances of social and political chaos prevalent at the time. Furthermore, this folklore illustrated a lack of social cohesion given its popularity among the uneducated peasants who, while “good” Orthodox or Catholic Christians, still adhered to local beliefs stemming back to pre-Christian “pagan” times and were willing to lay blame on scapegoats from the dregs of society.

Ideas stemming from early modern western Europe, particularly from the Catholic states within the Holy Roman Empire, had a significant impact on Poland and Hungary. Poland saw a

surge in witch-hunts in the seventeenth century and reached its peak in the early eighteenth century. This has been attributed to the fact that the witchcraft trials were switched from the ecclesiastical courts, which tended to be more lenient on the accused, to the secular courts. In addition, Poland became re-Catholicized after 1648, and a war between Sweden and Russia involved much of Poland, which caused much stress and a rise in religious fervor. Although exact numbers are not known, it is estimated that several thousand of the accused were convicted and executed during this period. Hungary's surge in witch-hunts also occurred in the late seventeenth century due to the expulsion of the Turks and the reestablishment of Christianity as the official religion. The trials peaked in the first two decades of the eighteenth century but waned by midcentury, when Empress Maria Theresa began restricting them. Historians have estimated that around 1,000 people were executed in Hungary during this period.

In the borderlands between the Habsburg and Ottoman domains, mostly Romania and the Balkan regions, local superstitions (folk belief systems) surrounding vampires and witches also resulted in the persecution or at least in the suspicion of physical manifestations of evil among the living. The terms “vampire” and “werewolf,” which were both associated with the so-called undead, were used to label local people deemed responsible for local catastrophes. These practices were typically associated with desecration of corpses, holy symbols, and other occultist rituals practiced by suspected pagans and heretics. Such myths shared many common characteristics with the ubiquitous anti-Semitism prevalent in these regions, which involved the infamous blood libel. People accused of being vampires were blamed for sucking the blood of the innocent or eating the bodies of their victims in addition to plotting to destroy communities and practicing maleficium. These beliefs also extended farther east into Muscovite Russia.

Muscovite Russia had various surges of witch-hunts throughout much of its history, but these reached their high point in the late seventeenth century and into the eighteenth century. The ecclesiastic authorities of the Russian Orthodox Church worked in tandem with tsarist

➤ HEINRICH KRAMER AND JAKOB SPRENGER, *MALLEUS MALEFICARUM*

The *Malleus Maleficarum* (The Hammer of Witches), written in 1486 by Heinrich Kramer and Jakob Sprenger and published in 1487, is a famous treatise on witches. The purpose of this treatise was to refute all arguments against witchcraft, dispel any skepticism against the existence of witchcraft and its impact in the physical world, and instruct magistrates and church officials on the procedures for discovering and prosecuting witches. Kramer and Sprenger, both Germans, were associated with the Church as clerics and inquisitors and were intensely familiar with canon law. They issued this document for the purpose of exposing the existence of witches in early modern European society and their responsibility for events such as famine, epidemics, and wars, further suggesting that they were likely to be women. Furthermore, the *Malleus Maleficarum* popularized the notion of *maleficium*, which was the practice of witchcraft in tandem with the devil in order to bring disorder and disasters in the physical world through the use of potions, spells, and satanic rituals. Even after the Protestant Reformation, when large parts of Europe broke with the Church, the *Malleus* continued to be used as a reference for the persecution of witches throughout most of Europe during times of the more ferocious witch crazes.

—Abraham O. Mendoza

secular officials in the persecution of witches and warlocks. The most significant characteristic of Russian witch-hunts is the fact that men rather than women were more susceptible to accusations of witchcraft. In fact, more men were accused and executed for witchcraft than women in early modern Russia, given the association of warlocks, rather than with witches, with magic in Orthodoxy. Moreover, the strict procedures designated by the Orthodox Church and the tsarist state made the entire process of prosecuting witches, which was much more bureaucratic and meticulous, relatively more effective and thereby avoided the outbreak of witch crazes in contrast with events in western Europe, minimizing the total number to only a few hundred executions. Some historians attribute

this to the fact that the only recorded cases come from the highest courts, meaning that the trials of serfs and those tried in local courts were not recorded, making it impossible to determine exactly how many people were actually tried and executed for witchcraft. Many of these outbreaks were associated with the tsarist persecutions of so-called Old Believers who opposed reforms of the Russian Orthodox Church and were deemed heretics in the fifteenth century. Practices such as water torture, trial by ordeal, and the use of other devices designed to extract confessions were prevalent in the persecution of witches, warlocks, and vampires.

Spanish and Portuguese Inquisitions in the Americas

The Spanish and Portuguese Inquisitions were initiated in response to what they saw as threats from the “new Christians,” or those families who were formerly Jewish and had recently converted to Christianity. While the crypto-Jews remained highly susceptible to both Inquisitions on the continent, those fears would be transferred to those living in the Americas.

Beginning in 1478 the Spanish Inquisition was created, designated with considerable power and jurisdiction by the Catholic Church. This Inquisition was able to reach outside of Castile and Aragon and even into neighboring Portugal. Therefore, when the Spanish began establishing their colonial empire in the Americas, the Inquisition was able to reach across the Atlantic as well. From the 1500s to the 1530s, friars were granted inquisitorial powers that were used for weeding out mainly those Jewish *conversos* and indigenous Christians who were believed to be false converts. In 1569 Philip II

ordered the establishment of Inquisition tribunals in Mexico City and Lima, Peru. Another one would later be established in Cartagena, Colombia, in 1610. Besides the *conversos*, these tribunals were set up to also protect against Protestant influence, especially once the British and Dutch began exploring the Americas. The Inquisition held jurisdiction over all non-indigenous baptized Christians. Protestants also fell into this category, as they had also received Christian baptism.

The main difference between the Inquisition in Spain and the Inquisition in Spanish America was the level of secrecy involved with the accusations. The accused were completely isolated from the outside world. Sometimes this isolation would last for years and many times only ended with the execution of the accused. The accused were also not informed of their charges, making it difficult for them to defend themselves against their accusers. Throughout the colonial period, the Inquisitions in the Americas only ordered execution in 100 cases, which constituted 1 percent of the total cases. Aside from *conversos*, the Inquisition also tried people for crimes such as sodomy, blasphemy, and bigamy. One of the ways in which the Inquisition sought to protect the colonists from what they saw as destructive ideas was through censorship. Incoming ships were searched for censored material, and manuscripts were inspected before publication. This did slow the dissemination of information within Spanish America but did not completely deter it.

Brazil had a different experience when it came to the Inquisition. Portugal established its Inquisition later than Spain, in 1547. A formal tribunal was never established in Brazil. Rather, the bishop of Bahia was given special inquisitorial powers whereby he and his *familiares* sought out sin and heresy among “Judaizers” and Protestants. Those considered to be guilty by the bishop were sent to Portugal, where they were put on trial.

There were a few instances in which the Inquisition made visits to Brazil. By 1591 the Dutch were becoming a real threat to the Portuguese in Brazil as they attempted to overtake the Portuguese settlements there. As a result, an inquisitorial court was sent to inquire into the

THE BLACK LEGEND

The term “Black Legend” was first introduced by historian Julian Judieras in his book *The Black Legend and Historical Truth*, written in 1914. The Black Legend has its origins in economic and religious rivalry: Protestants in countries such as England and Germany resented Spanish domination of the Americas. The Black Legend refers to the way the Spanish people conquered the Americas and depicts the Spanish as unnaturally bloodthirsty, cruel, and religiously fanatical. However, this “legend” is misleading. The Spanish were not any more cruel to natives than other Europeans were in their own colonial experiments. This supposed penchant for violence and cruelty is habitually attributed to the conquest of Granada in 1492. It is thought that because the Spanish were fighting off the Moors until 1492, they retained that same mentality in the Americas. This is a fallacy, because when the Spanish began fighting for Granada in 1490, they had not fought the Muslims for more than 100 years.

Part of this portrayal comes from comparisons to the Portuguese empire and its methods of colonization. The Portuguese are regarded as being tolerant because their colonization efforts did not involve the amount of deaths that the Spanish ones did. It is not that the Portuguese are

genetically predisposed to being nice; rather, the circumstances were different. The natives of Brazil did not die in the dramatic manner of the Aztecs or the Maya because these peoples were immersed in the interior of Brazil and therefore did not interact with the Portuguese for many years. Moreover, these natives did not possess the great amounts of wealth that the Aztecs did, so the Portuguese did not find it necessary to kill them in order to get to their gold. Finally, the Portuguese and Spanish expeditions were different in nature. The Spanish were mostly private expeditions of people intent on looking for the riches that they could not find in Spain. The Portuguese expeditions were crown-sponsored voyages with the purpose of establishing trading posts. Since Portugal was a smaller country, they needed to intermarry with the natives in order to retain their influence and could not afford to kill the natives. It is circumstances, not national character, that explains these and many other differences between Europeans and their actions. The criticisms of the Spanish empire have lasted until the present day and have been used by the non-Castilian regions of Spain to attack the central government.

—Monique Vallance

Dutch and see how much of a threat their presence posed to “Catholic Christianity and Christian morals in Brazil.” From Bahia, this court moved on to Pernambuco in 1593. The court returned to Portugal in 1595 but would return to Brazil again in 1618 and 1646. The main objective of these courts seems to have been to root out crypto-Jews, but they did not meet much success in this task.

Witches, Quakers, and Dissidents in British North America

Late-seventeenth- and early-eighteenth-century British North America experienced a variety of political, social, and economic tensions, particularly in New England, that led to the marginalization of certain groups of society based on their religious denomination, class, or gender. Economic growth, increases in population, and social stratification led to a gradual decline in the primacy of Puritanism, leading to widespread anxiety in colonial society about the loss of their

➤ COTTON MATHER, *WONDERS OF THE INVISIBLE WORLD*

Cotton Mather (1663–1728) was a Puritan minister, theologian, author, and scholar. While mostly noted for his association with the Salem Witch trials, he was also an advocate of science, Enlightenment thought, and smallpox inoculation. Nonetheless, it was his writings on the Salem Witch Trials, primarily in his *Wonder of the Invisible World*, for which he is mostly recognized. As a result, his historical reputation has been that of a religious bigot who sought to condemn and persecute witches, and he is known less for his other interests, which reveal him to be a much more complex and well-rounded individual given the context of the time and place. In *Wonders of the Invisible World*, while he does examine the supernatural elements of the world and condemn the use of witchcraft, he is also critical of the use of spectral evidence in the courtroom. Mather was skeptical that judges in the witch trials could make adequate use of accusations based on events that could not be proven in court and relied on speculative observations.

—Abraham O. Mendoza

established values to religious dissidents and the threat of supernatural evil as espoused by witches. This led to the persecution of witches, the ostracizing of Quakers, and the banishment of religious dissidents, mostly in New England, as a direct result of these dynamic changes in colonial American society. While the persecution of people who did not conform to the standards of Puritan communities of New England mirrors events across the Atlantic (witchcrazes, state and church persecutions, autos-de-fé), it occurred on an albeit smaller scale in terms of total numbers with less catastrophic social effects.

The notorious Salem Witch Trials of 1692, which occurred in the Massachusetts Bay Colony, offer a glimpse into the social and economic dislocations occurring in early colonial American society. The Salem Witch Trials occurred as a series of hearings before local officials regarding the use of witchcraft by local women, mostly in relation to local girls. With approximately 150 arrests after a frenzy of accusations, the courts eventually convicted 29 people of the felony

charge of witchcraft, resulting in 19 executions. Fourteen women and 5 men were hanged, and 1 man was crushed to death during an attempt to extract a confession from him. Five others were believed to have died in prison. Historians conclude that a variety of factors led to this outbreak of hysteria concerning witchcraft in the local community. The Massachusetts Bay Colony had recently lost its charter under James II and was placed under the Dominion of New England, resulting in decreased autonomy from the Crown. Furthermore, the young girls who had been “possessed” began accusing local women of witchcraft, mostly older women of low economic stature and position, which scholars interpret was a way of lashing out against their own subordinate position in a highly oppressive patriarchal and theocratic society. However, Salem was an anomaly within the greater history of the witch-hunt craze, as it was in North America and nothing like it occurred afterward.

In spite of Anglican intolerance in England spurring Puritan settlement in British North America, Puritans did not in turn accept other religious denominations within their dominions, particularly Quakers. Quakers, otherwise known as the Society of Friends, whose interpretation of Scripture differed from other Calvinist Puritan sects, had also migrated in large numbers to British North America to escape persecution in Anglican England. In the mid-1600s, numbers of them had settled in the Massachusetts Bay Colony or New York to spread their beliefs, which led to some of them being imprisoned and banished, with some cases of certain individuals being publically flogged. While Quakers did experience intolerance in the largely Puritan Massachusetts Bay Colony and New York, they were more welcome in the relatively tolerant colonies to the south, namely New Jersey, Delaware, and even Catholic Maryland. Pennsylvania, established by notable Quaker William Penn and granted to him by royal decree in 1681, was created specifically for the purpose of Quaker settlement.

Other religious dissidents, such as Roger Williams and Anne Hutchinson, who espoused more liberal interpretations of Scripture and the role of religion in society, were also subject to banishment from Puritan society. Roger

Williams (1603–1683), a theologian who had broken with Anglicanism, settled in the Massachusetts Bay Colony in 1631. His controversial views concerning the separation of church and state, equitable relations with indigenous Americans, and religious toleration eventually got him exiled from Massachusetts in 1635. From there he settled in what was to become Rhode Island in 1636, which was established as a beacon of equality and religious toleration, with its capital at Providence. Similarly, Anne Hutchinson (1591–1643), a dissident Puritan minister, controversial because of her position as an unauthorized woman minister, was also banished from Massachusetts. Her belief that women were entitled to share in the ministry in the same capacity as men as well as her advancement of the idea

of social equality of women in Puritan New England eventually led to a trial and imprisonment. Having been accused of blasphemy, heresy, and trying to poison the minds of women, she was demonized as a “Jezebel” by local Puritan notables. Upon her release and banishment, she continued to advocate her positions as her followers continued to be persecuted by authorities.

■ Introduction: Ecclesia and Doctrine

Among the most dramatic developments in the religious history of the early modern period was the splintering of Roman Catholic Europe into numerous religious bodies. The Catholic Church retained or regained control of most of the European population as well as expanding with Spanish, Portuguese, and French conquest and commerce to become the first worldwide church, but it was forced to cede much of the European north to the new “Protestant” churches. The causes of the Reformation are one of the most vexed problems in European history, but the differences between Catholics and Protestants clustered around a handful of issues. Some involved rejection of the Catholic hierarchy; Protestants unanimously rejected the special status that Catholics gave the clergy, as particularly marked by the practice of clerical celibacy. In one of the most famous slogans of the Reformation, its pioneer, Martin Luther, called for “the priesthood of all believers.” Protestants rejected the authority of the pope, many even identifying him as the biblically foretold antichrist or “man of sin.” Protestants were identified with the doctrine of “salvation by faith,” rejecting the idea that good works of any kind could contribute to salvation. The doctrine of

Purgatory, which held that those who died in sin could work off the penalties through suffering before finally being admitted to heaven, was unanimously rejected by Protestants along with associated practices, such as masses and prayers for the dead to ease their passage through Purgatory. Protestants also denied Transubstantiation, the belief that the wine and bread consecrated during the Mass were actually transformed into the blood and flesh of Jesus Christ, despite their remaining unchanged to human senses.

But differences between Protestant churches could also be great. Lutherans and Calvinists, while both opposing Transubstantiation, differed passionately on what exactly the formula “this is my body” really meant. The Church of England preserved many of the rituals and physical trappings of Catholicism, causing its Scottish and Continental Protestant contemporaries to view it as a weak, compromising body. The persistence of bishops in the Church of England and other “Anglican” churches also made them different from Protestant bodies with similar theologies that rejected episcopacy in favor of Congregational or Presbyterian church organization. The Anabaptists, by denying the validity of infant baptism, seemed to be attacking every

other church as illegitimate and were the most viciously prosecuted of all, by Catholic and Protestant alike. The Socinians, a small minority, rejected the doctrine of the Trinity and were also persecuted by Protestants and Catholics.

All of these differences, while often carried to the point of physical violence, also led to the blooming of a rich body of dogmatic and controversial literature. The Council of the Catholic Church held at Trent issued a systematic statement of its doctrine, while endless catechisms, confessions, and doctrinal statements came from Protestant presses. Priests and ministers sought to instill their doctrines in their parishioners through catechizing, preaching, and teaching. All of these together made the sixteenth and early seventeenth centuries the last period in European history when intellectual life was dominated so completely by religion.

The Eucharistic Theology of John Calvin

In his theology of the Eucharist, also known as Holy Communion, or the Lord's Supper, John Calvin (1509–1564) sought to forge a middle

Sixteenth-century theologian John Calvin. (Library of Congress)

way between the eucharistic theologies of the two principal branches of Protestantism in his time: the Lutheran and the Reformed. Lutherans founded their conception of the Eucharist on the words of institution, “This is my body” and “This is my blood,” that Jesus uttered as he distributed bread and wine at the Last Supper. These words implied, in the Lutherans’ view, that Christ’s physical body is in, with, and under the bread and wine, namely, the elements of the Eucharist.

The Reformed, by contrast, held that Christ’s ascended body resides exclusively in heaven. They therefore interpreted the words of institution figuratively and, before Calvin’s influence outstripped that of Swiss Protestant reformer Huldrych Zwingli (1484–1531), treated the Eucharist primarily as a memorial of Christ’s crucifixion, in accordance with Jesus’s words, “Do this in remembrance of me” (Luke 22:19). In view of their disagreement on this topic, the Lutheran and Reformed churches could not unite. Indeed, the Lutherans considered belief in Christ’s physical presence in, with, and under the bread and wine of the Eucharist a fundamental article of the Christian faith and thus denied that the Reformed were Christians.

Calvin sought to remedy the Lutheran-Reformed breach by articulating what he considered Scripture’s doctrine of the Eucharist, a doctrine that, in his view, affirmed the truths in both positions while rejecting the inadequacies of each. With the Lutherans and against a Zwingli-inspired Reformed view of the Eucharist, Calvin insisted that in the Eucharist, Christ’s flesh is actually present to persons of genuine Christian faith.

With the Reformed and against the Lutherans, however, Calvin insisted with equal firmness that believers feed on Christ’s flesh in the Lord’s Supper only in a spiritual manner. One must interpret the words of institution figuratively, he argued, because otherwise one would implicitly affirm that unbelievers, destined for eternal death, will live everlastingly, for Christ promises that whoever eats his flesh will live forever (John 6:51). Moreover, the Lutherans themselves interpreted the words of institution figuratively in that they did not identify the bread and wine per se with Christ’s body and

blood but held that Christ's body and blood are in, with, and under the eucharistic elements.

Calvin insisted that the Lutherans err in considering Christ's flesh ubiquitous and thus capable of occupying many places at once, for the nature of flesh excludes ubiquity. To declare Christ's body ubiquitous, therefore, would be tantamount to denying that Christ assumed a human nature, that is, the heresy of Docetism, condemned by Lutherans, Reformed, and Catholics alike. According to Scripture (e.g., Acts 3:21), Calvin asserted, Christ's body will remain in heaven, far from the elements of the Eucharist, until his second coming.

With the Lutherans and against the Zwinglian Reformed, however, Calvin denied that Christ's flesh is absent from believing participants in Holy Communion. Although the minister does not drag Christ's body down from heaven when he utters the words of institution, Calvin maintained, Christ does lift the souls of believers up to his body in heaven. Precisely for this reason, however, Calvin held with the Reformed and against the Lutherans that one could consistently affirm that believers spiritually feed on Christ's flesh while denying that unbelieving communicants do so as well.

The Eucharist, Calvin taught, exhibits, conveys, and seals God's offer of eternal life through faith in the crucified Christ. It exhibits this offer by presenting, in visible tokens, the body and blood of Christ shed for sinners. It conveys this offer by serving believers Christ's crucified flesh in a spiritual manner that they may eat of it by faith and live forever, and it seals God's offer by assuring believers that they receive salvation through faith in Christ just as surely as they eat the eucharistic elements.

The Lord's Supper, Calvin believed, also unifies the church by visibly uniting its members to Christ, who by sharing himself with all believing communicants makes all of them one in him. Such benefits, in Calvin's view, warrant the celebration of the Lord's Supper at least once a week. His own church of Geneva, however, allowed Calvin to celebrate the Eucharist only once a month, and Reformed churches of later generations have typically served communion even less frequently. Calvin never overcame Lutheran-Reformed divisions over the Eucharist. He did,

➤ THE *CONSENSUS TIGURINUS*

Swiss Protestants' embrace of a common confession of eucharistic doctrine, the *Consensus Tigurinus* (1549), reflected agreement more apparent than real over the doctrine of the Eucharist. This document, a set of 26 articles drafted by Calvin, constitutes a painstakingly worded compromise designed to conceal sometimes dramatic differences among the signatories. Especially significant ambiguities appear in articles 14, 19, and 20 in which the phrase "in the Supper" may mean either "by means of the Supper" or "during the Supper."

Construed in the former sense, these articles affirm Calvin's view that God conveys grace by means of the Eucharist. Construed in the latter sense, however, they accord with the opposing views of Heinrich Bullinger, who also signed the *Consensus*. Under threat of invasion by the Catholic emperor Charles V, the document's signatories appear to have closed ranks and agreed to disagree about the finer points of eucharistic theology.

—Dennis Jowers

however, unite the Swiss Reformed churches in a common confession on the subject, the *Consensus Tigurinus* of 1549.

Luther and Zwingli

The intellectual legacy of the Protestant Reformation that began in the sixteenth century in the Holy Roman Empire found expression in the

➤ LUTHER, ZWINGLI, AND THE EUCHARIST

Although many theological disagreements separated early Protestant reformers, the major theological conflict between Martin Luther and Ulrich Zwingli centered on the nature of Christ's presence at the Eucharist. While the Eucharistic theology of both men repudiated the teaching regarding Transubstantiation, a view long held by the Roman Catholic Church that the Eucharist contained the actual body and blood of Christ, Luther's view of the Eucharist nevertheless came to embrace the idea that Christ was indeed present in a mysterious and sacramental way in the celebration of the Eucharist ("Real Presence"). Zwingli, however, believed that the Eucharist was a memorial or commemoration only and termed his Eucharistic theology the "Real Absence." Because such an intense theological rift threatened the unity of the Protestant movement, the two men agreed to meet in public debate in Marburg in 1529. At this Marburg Colloquy, the disagreement between the two reformers escalated to the point that Luther rose to write on the table the words from the Gospel, "This is my body." The two reformers could not reach an agreement about this crucial issue, and the Marburg Colloquy ended with the divisions between the two factions only further intensified. The irreconcilable theological differences between the two men split the Protestant Reformation.

—Cheryl H. White

lives of two men whose theological disagreements splintered the early movement of Protestantism: Martin Luther (1483–1546) of Germany and Ulrich Zwingli (1484–1531) of Switzerland. Both men promoted reformist views of the Roman Catholic Church as contemporaries, but their failure to reach accord on key theological issues meant that the Protestant movement of the sixteenth century would eventually divide.

Martin Luther took Augustinian orders in 1507 and rapidly rose through the clerical ranks to become professor of Holy Scripture at the University of Wittenberg in the Holy Roman Empire. By early 1519 Luther had formulated the basis of what would become his personal theology that justification before God comes through faith alone, a teaching that contradicted the

doctrine of works as taught by the Roman Catholic Church. Luther also deplored the corruption that he viewed within the Church, including the practice of the sale of indulgences, which generated considerable revenues for Rome. Luther posted his famous *Ninety-Five Theses against the Sale of Indulgences* to his church door in Wittenberg on October 31, 1517, to arouse awareness of this particular abuse.

Luther could not have predicted the firestorm of controversy that resulted from his action. Copies of his theses circulated throughout Europe, and Luther failed to respond to orders that he answer charges of heresy. Instead, he sought and received the protection of the powerful Frederick III of Saxony and worked further on theological treatises related to the study of the Holy Scripture, particularly the Epistles of St. Paul. In 1520 Luther completed the *Address to the Christian Nobility of the German Nation*, which asked the nobles to assist with church reforms in Germany, and his work *Babylonian Captivity of the Church*, which amounted to an attack on papal claims of supremacy. Also during that year Luther published *On the Freedom of a Christian Man*, which argued his theological position on justification by faith alone, a conclusion that Luther claimed to have reached through his study of *St. Paul's Epistle to the Romans*. Pope Leo X issued a papal bull (*Exsurge Domine*) that same year ordering Luther to recant his heretical views or face excommunication. A later papal bull of January 1521, *Decet Romanum Pontificem*, formally excommunicated Luther from the Roman Catholic Church.

By this time, Luther's theological positions were so strong that his conscience would not permit him to recant, even when Holy Roman Emperor Charles V summoned him to answer to the Diet of Worms in 1521. Taking refuge in Wartburg, Luther proceeded with a German translation of the New Testament and further reforming works such as his *Catechisms*. His movement attracted a large and enthusiastic following of like-minded reformers and quickly spread throughout the Holy Roman Empire. Many of Luther's followers helped spread reform throughout various places on the European continent.

One such reformer was a priest from Switzerland, Ulrich Zwingli, who was born in Waldhaus

in 1484. Also intensely interested in the study of Holy Scripture, Zwingli found himself stirred to reformist ideas as well, initially from the work of Christian humanists such as Desiderius Erasmus. Unlike Luther, Zwingli's theology did not focus on concern over the means of salvation but instead focused on the idea that Holy Scripture was the only authority binding on every Christian. Zwingli's interpretation of Holy Scripture led him to encourage his followers to abandon certain traditional Christian practices such as Lenten fasting, veneration of saints, and frequent celebrations of the Eucharist. The cornerstone and beginning point for all of Zwingli's theological expositions was Holy Scripture, placing it above the authority of previous Church Councils or even the writings and opinions of the Church Fathers.

For Zwingli, only those rituals and observances that Holy Scripture distinctly and literally authorized were valid. In this way Luther and Zwingli differed dramatically, for Luther understood Holy Scripture to allow the observance of two Sacraments (Baptism and Eucharist), and he sought to preserve many elements of traditional Christian observance. When the city council of Zurich asked for public debate centered on Zwingli's ideas, Zwingli prepared a series of brief articles that remain an excellent source of his theological summations. These articles promoted Zwingli's views that Holy Scripture was the only authority binding upon the Christian and included his criticism of the sacrificial nature of the sacrament of the Eucharist, the denial of the veneration of saints, and an attack on what he believed to be the false teaching of purgatory. However, he did not completely denounce the sacraments. Instead, he interpreted them to be an "oath" or "pledge", as opposed to mystical signs from God.

Because the theological disagreements between Luther and Zwingli had the intellectual potential of splintering Protestantism, the two men agreed to meet in 1529 in Marburg to engage in an open public debate over their differing views of the Eucharist. Luther's belief in a doctrine that he termed "Real Presence" affirmed the sacramental nature of the Eucharist, while Zwingli's theology of the "Real Absence" reduced the ritual to a mere commemoration of

the Last Supper. Believing it to be a memorial and a sacrament in that it showed their Christian allegiance, Zwingli did not offer the Eucharist frequently to the people of his church in Zurich. These quite pronounced differences of opinion did not allow for compromise or reconciliation of viewpoints. Both men left behind an intellectual legacy that other reformers quickly adopted and adapted, influencing many Protestant groups today. Among Zwingli's original followers emerged a more radical group known as the Anabaptists, who broke away from Zwingli's reform movement over the issue of infant baptism.

The original intent of these reformers had been to renew and restore the one, holy, catholic, and apostolic Church; reform its abuses, and correct its errors. Beginning new Christian churches had not been the expected outcome. Luther devoted much of his life to restoring the Pauline doctrine of justification to Church teaching regarding salvation. Indeed, Luther urged his followers not to use his name to identify themselves, citing the universality of the one church. Zwingli died in 1531 while fighting in a religious war at the Battle of Kappel. While no Christian groups directly attach his name to their lineage, Zwingli's theology influenced many of the modern churches of the Reformed tradition in Europe.

John Knox

John Knox was a Protestant reformer from Scotland, born in 1505 in Haddington, although some biographers dispute this date and argue for a later birth date of 1510 or 1515. Not much is reliably known of his formal education and early adulthood, although his volumes of original writings suggest that he had a proficiency in both Latin and French and probably also

➤ KNOX AT ST. ANDREW'S CASTLE

Following the murder of Cardinal David Beaton in 1546, the Scottish government and ecclesiastical authorities undertook serious measures to identify all Protestant dissidents and place them under arrest. Knox could hardly have escaped the notice of these authorities and moved around the countryside to avoid detection and arrest for some time following Beaton's murder. Because Knox tutored the children of some influential Scottish lords, he enjoyed some degree of protection, at least for a brief period. Knox took refuge in the Castle of St. Andrew's among the notorious company of the murderers of Cardinal Beaton and perhaps hundreds more Protestant sympathizers. While Knox abhorred the execution of George Wishart, whose death led to the murder of the cardinal, he must have morally wrestled with the actions of the murderers. These circumstances likely made for a strange mixture of religious dissent and religious fervor during this confinement at St. Andrew's Castle. While taking refuge in the castle, Knox read the *Gospel of John* in the chapel of the fortress and offered extensive commentary on it to those who assembled to hear him. This early circumstance provided Knox with the opportunity to demonstrate what would become a notable and renowned personal characteristic: a fiery and inspiring style of preaching.

—Cheryl H. White

studied at least some Hebrew. Some sources claim that Knox received a university education at St. Andrews; others suggest that he studied at Glasgow. Furthermore, scholars know little of his ecclesiastical career in his native country beyond the fact that he was an ordained priest. Early religious influences for Knox were few, given what was likely limited exposure to diversity of thought. However, reformed thinking probably found its way into Scotland by the early 1540s by way of George Wishart, who became interested in Protestantism because of his travels through Germany. Wishart's execution in 1546 at the hands of the Scottish cardinal David Beaton only intensified Protestant sympathies in Scotland, and Knox became a champion of spreading the new reformed thinking there. In the political turmoil and aftermath of Wishart's

execution and the subsequent retaliatory murder of Cardinal Beaton by a group of radicalized Scottish Protestants, Knox himself faced imprisonment and later exile to England.

While in England, Knox was a frequent visitor at the court of King Edward VI, where he received a license to preach in 1549 and served a brief period as a royal chaplain. A gifted preacher with a renowned talent for powerful oratory, Knox soon developed a reputation for having the ability to arouse Protestant sentiments. However, even with the Anglican reforms of Edward VI's reign, the Church of England remained too Roman in practice for Knox's evolving theology, so he refused a bishopric of Rochester when it was offered to him in 1552. Knox played a consultative role in the first revision of the English *Book of Common Prayer* during that same year. Knox's work on the English prayer book included the development of the theologically significant "Black Rubric," which carefully stipulated that an individual decision to kneel during Holy Communion did not imply acceptance of the doctrine of Transubstantiation. By this time Knox's personal theology approached a unique blending of Lutheran and Calvinist reformed thought, particularly with regard to doctrines regarding the Eucharist. Following the accession of the Roman Catholic Mary I to the throne of England in 1553, Knox traveled to Geneva, where he consulted with John Calvin. Meanwhile, his own home country of Scotland was also under Roman Catholic rule in the form of regency for Mary Stuart, Queen of Scots, led by her mother, Mary of Guise.

In 1555 Knox briefly returned to Scotland to survey the state of religion there. Although still under the regency of Mary of Guise, Knox found the countryside amenable to Protestant thought, and he found support among many of the fiercely independent Scottish lords. He did not stay long in Scotland, returning to Geneva the following year, where he found a home for two years in the Reformed Church of John Calvin. It was in Geneva in 1558 that Knox published his famous pamphlet *The First Trumpet Blast against the Monstrous Regime of Women*, a treatise thought to target the reigns of both Mary Tudor in England and Mary of Guise in Scotland. The work argued that women did not

have the divine right or authority to rule except in rare circumstances, and Knox first published the document anonymously for fear of its repercussions. It was also during this time that Knox's exposure to the tenets of Calvinism further solidified his politically theological belief in the right of a people to overthrow a wrongful government. When English Protestant exiles in Geneva left to return to England upon the accession of Elizabeth I in 1558, Knox decided to return to Scotland yet again.

Knox found a complex political and religious environment when he returned to Scotland and was himself the object of Mary of Guise's designs to eliminate Protestantism there. The Protestants waged a revolution against the Catholic regency and found Knox as the central point of focus. Negotiating with the government of Elizabeth I for support for the Protestant cause, Knox helped bring about a victory. In 1560 Mary of Guise died suddenly, and the subsequent Treaty of Edinburgh ended all formal hostilities, paving the way for the Scottish Parliament to implement Protestant reforms, including the renunciation of papal authority in Scotland and the prohibition of the celebration of Mass. Following this, Knox became the minister at the Church of St. Giles in Edinburgh and was instrumental in the development of a reformed liturgy for the Church of Scotland. He helped develop both the Scottish Confession of Faith and the Scottish Book of Discipline, which patterned church government along a Presbyterian model. Scholars believe that by this time Knox was already working on his five-volume *History of the Reformation*, which he completed several years later. The work remains a standard chronicle of the reformed movement in Scotland during the sixteenth century.

When Mary Stuart, Queen of Scots, returned to Scotland from France in 1561, she and Knox had a troubled relationship, although Knox maintained that he would abide by her lawful rule in a series of personal confrontations. Continual theological conflicts with Roman Catholic authorities characterized Knox's time in Scotland, where he continued to assert Protestant ideals regarding church administration and ordination. Meanwhile, a series of personal scandals led to Mary Stuart's abdication in 1567 in favor of

her one-year-old son James (the future James I of England and James VI of Scotland). John Knox preached the sermon at the young king's coronation, cementing the survival of Protestantism in Scotland for the future. By the time of Knox's own death in 1572, his pervasive influence in matters related to church polity and governance ensured that the Church of Scotland would have a Presbyterian model rather than the Episcopal model of the Church of England.

Nikon's Reforms

Nikon was a patriarch of the Russian Orthodox Church whose significant efforts at reform eventually led to a deep division within the Church. Born Nikita Minin in 1605 of peasant origins outside of Novgorod, he received a monastery education before becoming a secular parish priest in Moscow and taking a wife. However, their marriage produced three successive stillborns, which convinced Nikon that he needed to seek the monastic life. After convincing his wife to become a nun, he entered the Solovetskii monastery, where he took the name Nikon. A disagreement led him to join a neighboring monastic community of Kojezersk, of which he became the abbot in 1643. Over time his work ethic and dedication to monastic life earned him the attention of the Russian Church hierarchy, and Tsar Alexis appointed him the metropolitan bishop of Novgorod. Nikon was then elected patriarch of Moscow in 1652.

Once he became patriarch of Moscow, Nikon undertook a series of reforms, none of which were without controversy. He primarily directed the reforms at achieving a complete restoration of old Greek worship rituals and texts for use within the Orthodox Church in Russia. These reforms offered the promise of bringing the Russian

THE OLD BELIEVERS

The Old Believers are those who became separated from the Russian Orthodox Church following the reforms of Patriarch Nikon in the seventeenth century. As a protest against what they believed to be unnecessary concessions and modifications to more closely align with the Greek liturgy and ritual, these separatists denounced the change of the traditional Russian rites and refused to embrace the innovations. Although some of the dissenters fled Russia, many remained and followed the guidance of Awakum Petrov, a priest who led the conservative response. At a national synod in 1666, the Russian state and church declared this conservative element to be heretical. Many of the Old Believers suffered imprisonment and execution for their refusal to comply with the new church reforms. Persecutions and attempts to suppress this faction within the Russian Church ranged from moderate to severe at varying points in history until 1905, when Tsar Nicholas II promoted an end to discrimination against the Old Believers. Since that time, this faction within Russia has begun to reclaim a legitimate place with religious society and the right to worship in the form that was in place immediately before Nikon's reforms in the seventeenth century.

—Cheryl H. White

Church into a more complete alignment with the Orthodox churches elsewhere in Europe by achieving uniformity of practice and worship. Nikon sought to address the service books used in Russia, which long before had been translated from Greek into the Russian language. However, over time there were mistranslations and textual errors, which affected many of the rituals of the Church so that they no longer aligned with the Greek Orthodox tradition. Nikon's reform efforts sought to restore these texts to the exactness of the original Greek texts from which they derived. Even in the previous century, the Greek Orthodox Church in Constantinople had criticized the Russian mistranslations and misuse of the original liturgy, but a Russian synod of 1551 had authorized their continued use.

Nikon's personal role in Russian reform extended only to liturgical issues; he left the textual reforms to a committee of correctors.

Furthermore, Nikon's view of the Church seemed to change once he became patriarch, as he began to see the Church as supreme to the state, probably due to the privileges extended to him by the tsar, which included allowing Nikon the use of the sovereign title. He publicly opposed a series of Russian laws (*Ulozhenie*), portions of which sought to restrict the power of bishops over Church lands. Nikon also published "The Schism of the Roman Church" in which he argued that all of the civil and ecclesiastical powers of the papacy rested with the Russian patriarchate. His power seemingly knew no limits, even extending to issuing decrees in the name of the tsar when Alexis left Russia for war in 1654.

Not surprisingly, Nikon's attempts at reform met with strong opposition. Early resistance manifested itself within the printing office in Moscow, where a number of workers refused to complete the printing of a new Psalter. Nikon responded by placing the printing office under the supervisory jurisdiction of his own office. Other dissenters included a group known as the Zealots of Piety, of whom Nikon had once been a member, who made strong appeals to the tsar for him to intervene and stop the changes taking place. Many within the Russian Church believed that Russian national identity was linked to continued independence from the dictates of the Greek Orthodox Church and accused Nikon of attempting to "Hellenize" the Russian Church. Undeterred, Nikon called synods in 1654 and 1655 and corresponded with the patriarch of Constantinople to organize and coordinate what he believed were the necessary reforms. Nikon published the reformed service books in 1656, affirmed by a synod that met the same year. Henceforth anyone making the sign of the cross with two fingers instead of three would be excommunicated (this was a practice that developed uniquely in Russia and contradicted the Orthodox teaching on the symbolism of making the sign of the cross as a personal act of devotion). He also sought reforms with priestly vestments to bring them more in line with the Greeks. Finally, he went on a campaign to eliminate any icons he found to be "heretical counterfeits" by conducting house-to-house searches. Any who were found to not abide by the new rules would face severe punishments.

Reaction was swift and strong. Some opponents accused Nikon of anti-Russian sentiments and of corrupting the old ways. It did not help that these reforms coincided with a plague in 1654 and that people were nervous about the approach of the year 1666, a year that many feared would bring the apocalypse. During the same time Nikon's enemies began maligning him to the tsar, attempting to convince the tsar that the power of the Church had now eclipsed his own power. This plot worked. The tsar became angry with the patriarch, and Nikon offered his resignation, which was accepted. Nikon retired to his previous monastery but apparently attempted to regain his office when he learned that the patriarchate remained vacant. In 1664 Nikon simply appeared in the Moscow church for services and occupied the patriarch's reserved place as if he had never retired his post. In addition, Nikon's behavior was increasingly eccentric, accented by extravagant personal dress and decorum and the undertaking of an expensive building campaign for a new patriarchal palace.

The controversy surrounding Nikon brought the patriarchs of Alexandria and Constantinople to Russia to attend the synod arranged to try Nikon on charges of betrayal of the Russian Church. The synod of 1667 formally deposed him as patriarch and stripped him of all ecclesiastical authority except for that of a monk. Furthermore, the synod sentenced Nikon to life confinement at the monastery of Therapontof on the White Sea. Nikon was succeeded by Joaseph II, who confirmed all of Nikon's reforms. Following Nikon's death in 1681 his reforms continued to stir controversy, creating an eventual divide within the Russian Orthodox Church among those who accepted the reforms of Nikon and the "Old Believers," the resistance group that evolved from the Zealots of Piety, who continue the Russian liturgical practices that existed prior to 1655.

The circumstances surrounding the fall of Nikon from power and influence remain confusing, since clearly his reforms stood after his deposition and death. Many scholars believe that his brusque manner and demanding nature created many enemies for him who worked to bring about his downfall. In addition, Nikon's

desire to assist the Russian Church in operating independently of the state likely incurred the ire and mistrust of Tsar Alexis, whose support was necessary for Nikon. The tsar also registered public disagreement with Nikon in 1656 over some of the liturgical changes, although it remains uncertain how much this influenced the tsar in turning against the patriarch. Before Tsar Alexis died in 1676, he requested that Nikon be restored to the patriarchy of Moscow, but a later synod refused this. When Nikon died in 1681 his funeral was that befitting of a patriarch, and all judgments against him were revoked.

Creating the Anglican Church

The Church of England as it developed in the sixteenth century was a combination of disparate elements. Unlike many continental Protestant churches such as those in the Lutheran and Reformed traditions, it looked to no one individual as its founder. Following Henry VIII's (1491-1547) break with Rome in 1529, there was a complicated struggle among English Protestant activists, the English state, and the fundamentally conservative and Catholic mass of English people. Although the institutional structure of English Catholicism was broken down in the 1530s, from the link with Rome to the religious orders, much Catholic doctrine continued to be part of the English church. This was mainly due to the fact that Henry's break with Rome was due to an argument over the annulment of his marriage rather than doctrine. For instance, William Tyndale (ca. 1494-1536) was condemned by Archbishop Wolsey in 1529 for his translation of the New Testament. In addition, the Six Articles of 1539 reaffirmed, under penalty of persecution as a heretic, such Catholic doctrines as

Allegorical illustration regarding the breaking of ties between England and Rome. King Henry VIII is depicted sitting on his throne surrounded by clergymen and named bishops. He is trampling on the figure of Pope Clement VII, who defied the king over the matter of the divorce from his first wife, Catherine of Aragon. In 1534, the English Parliament, under pressure from Henry, enacted the Act of Supremacy, officially severing England's ties to the Roman Catholic Church. (Hulton Archive/Getty Images)

transubstantiation and priestly celibacy. The infrastructure of bishops, archbishops, cathedrals and much of the hierarchy among secular priests also remained. However, Henry did enact some Protestant changes to the English church, including authorizing the publication of the Great Bible, the first state-authorized publication of the Bible in English, in 1538. Henry's religious leanings tended to change according to his political needs; however, he never formally denounced the doctrine or ritual of the Catholic Church.

The reign of Henry's son Edward VI (1547–1553) was the high-water mark of Protestantism in the Church of England. Although Edward was a committed Protestant, the real work was carried out by a group of his advisers and regents,

notably the archbishop of Canterbury, Thomas Cranmer (1489–1556). Catholic doctrines and practices banned in Edward's reign included the mass, clerical celibacy, images in church, and liturgy in Latin—innovations that provoked much ineffective popular opposition. Prayer Books providing complete Protestant liturgies were issued in 1549 and 1552, although much of their content was derived from previous Catholic liturgies. A campaign of iconoclasm and confiscation was instituted during Edward's reign, forcing many churches to hide their valuables under the floor and in parishioners' homes. Still, Edward's men were able to take a vast amount of church silver, which was melted down and used for coins. The Book of Common Prayer never came into use, as Edward died in 1553, leaving his Catholic sister Mary I on the throne.

The death of Edward and the accession of Mary (1516–1558) led to a dramatic return to Catholicism and persecution of Protestants including Cranmer, who was burned at the stake as a heretic. It is estimated that 284 Protestants were executed during the five short years of Mary's reign. In addition to providing a martyrology for subsequent generations of English Protestants, the Marian persecution also drove around 800 church leaders—the Marian Exiles—to the European continent, where they were exposed to the ideas and practices of Continental Reformed Churches. Some concluded that the Church of England, even as reformed in Edward's reign, was still tainted with Catholicism. Mary was able to reinstitute all of the vestiges of Catholic doctrine and ritual and also reverse all acts passed by Parliament during Henry's reign that had formally separated the Church of England from Rome. However, she was never able to formally return England to the Catholic Church.

In 1558 English religion changed again with the accession of Mary's Protestant sister Elizabeth (1533–1603). Elizabeth's first order of business was to put through the Act of Supremacy in 1559, which reinstated the acts repealed by Mary and made Elizabeth supreme governor of the Church of England. The use of the term "supreme governor" instead of "supreme head" was due to a concern by some at having a woman at the head of the church. The next issue dealt with the issuing of a new Prayer Book in 1559, which was a

modified version of the 1552 book. The modifications caused quite a stir, as they allowed for the return of priestly vestments and left the question of transubstantiation open for interpretation. The Convocation of the Church of England drew up the Thirty-Nine Articles, a statement of faith, in 1563, and Parliament made it binding on the clergy in 1571. The articles were formulated to appeal to a broad spectrum of citizens, affirming such classic Protestant doctrines as Justification by Faith alone, the final authority of the Bible on matters related to salvation, the permissibility of clerical marriage, and lay communion in both bread and wine as opposed to the Catholic practice of reserving the wine for the clergy. The articles drew on previous English statements of faith and both Lutheran and Reformed Continental works. This middle-of-the-road approach, or the Elizabethan Settlement, was bound to cause anger on both sides as being either too Catholic or not Catholic enough. This problem was solved with the passing of the Act of Uniformity in 1559, which gave the Book of Common Prayer authority and stated that every man was required to attend church once a week or be fined 12 pence.

Although Elizabeth was revered as the savior of English Protestantism, many members of the Church believed that it needed more reformation. The use of vestments, considered by many a relic of the Catholic priesthood, was particularly controversial. Many also condemned the use of images in church as tending to idolatry. By the latter part of Elizabeth's reign, some were challenging the very existence of bishops and arguing for an alternative church polity based on continental models: Presbyterianism, a belief in the equality of all ministers, and church government by ministers and elders. Presbyterianism overlapped with Puritanism, a belief in the urgency of Church reform in the direction of Continental and Scottish Protestantism. The principled defense of the English Church against the Presbyterians as a *via media* between extremes was most influentially put forth by the minister Richard Hooker (1554–1600) in *Of the Laws of Ecclesiastical Polity* (1594–1662).

Despite these disagreements, Elizabeth's reign was marked by the slow but permanent work of making the English people Protestant. The accession of her cousin James VI of Scotland

➤ JOHN FOXE AND *ACTS AND MONUMENTS*

The most influential Church history produced in the English Reformation was the minister John Foxe's *Acts and Monuments*, popularly known as the *Book of Martyrs* or *Foxe's Martyrs*. The first edition was published in Strassburg in Latin in 1554, as Foxe, like many Protestant ministers, was in exile during the reign of the Catholic Queen Mary. An expanded edition in English was published in 1563, and many more editions appeared in the following centuries. Foxe portrayed Church history as a struggle between marginalized heretics carrying the true faith and a Church hierarchy headed by the pope intent on crushing it. Foxe particularly focused on the sufferings of Protestants during the reign of Queen Mary. Foxe's belief in the responsibility of the "Godly Prince" to reform religion made his position congenial to the Elizabethan government. *Acts and Monuments* was one of the "four chained books" ordered to be kept in English parish churches. The gory illustrations of the tortures and executions of heretics made the first encounter with Foxe's work a memorable occasion for generations of English children. The work also contributed to the strong anti-Catholicism that would be a feature of English Protestant culture for centuries.

—William E. Burns

(1566–1625) as James I of England in 1603 was the first since Henry VIII's nearly a century earlier not to lead to a change in religion, which dashed the hopes of those Puritans that James's Presbyterian upbringing would bring about the reforms they desired. James's principal contribution to the Church of England was his commissioning of a group of scholars to produce the King James translation of the Bible (1611), a work that drew heavily on previous Protestant translations like Tyndale's. Along with the Book of Common Prayer, the King James Version would be a powerful shaper of English language and thought for centuries.

The Church of Ireland, 1688–1729

The Church of Ireland as a national as well as religious entity had been born out of debate and compromise. The church claimed (and continues to claim) to be the true apostolic and Catholic Church in Ireland. These assertions share certain doctrinal arguments with the Anglican organization; however, the Church of Ireland also had a distinct doctrinal tradition. The struggle between Protestant William, Prince of Orange (r. ca. 1688–1702), and Catholic James II (r. 1685–ca. 1688) known as the Glorious Revolution in England and the subsequent Williamite campaign in Ireland saw a significant improvement of the church's security but did little to resolve the question of the church's relations with its English counterpart.

From the start, the Church of Ireland was concerned with its own identity. Wholesale adoption of the Church of England's canons, archbishop James Ussher argued in 1634, would "betray the privileges of a national church. . . . And . . . we might fear in time to have a canon obtained in the church . . . giving the Church of England such superintendence over us, that nothing should be made law here that were not allowed there." Ultimately, the Church of Ireland adopted the Church of England's Thirty-nine Articles but also kept the Irish Articles of 1615.

In the aftermath of the Williamite campaign in Ireland (1688–1691), elements of both compromise and separation were forcefully expressed. Ironically, one reason that at least some Church of Ireland clerics could advocate an Irish exceptionalism was that in 1688 and 1689, when James's government had been in control in Ireland, church officials had prepared memoranda outlining a justification for breaking the church-state compact and renouncing establishment status. The Church of Ireland would be led in the last years of the seventeenth century and into the eighteenth century by clerics who could envision existence without the imprimatur of the state.

Furthermore, the victory by William, Prince of Orange, was largely a result of Irish Presbyterian efforts and a primarily Dutch regular army campaign in Ireland. The Anglican contribution to the 1688–1691 struggle had been, at best, of limited significance.

In 1691, one archbishop and seven bishops (out of a total of 24) were appointed by the newly secure government to fill vacant sees. A further bishop was appointed in 1692. These appointments led to a dramatic resurgence in Church of Ireland activity. However, 1692 marked the high point of appointments of Irish-born clerics to the episcopal bench until well into the nineteenth century. From the start of the new administration, there was significant disagreement between the church hierarchy and the new powers in England. Perhaps the first indication of disagreement could be seen in the senior clerics who refused to renounce their oath to James II; among the nonjurors were one bishop, William Sheridan of Kilmore, and two figures who would become prominent in the nonjuror movement in England, Henry Dodwell and Charles Leslie. The degree of sympathy within the Church of Ireland to this position, with its direct challenge to the legitimacy of William and Mary's reign, became clear in 1697 when the administration sought to require an oath of abjuration of James II. Opposition was immediate from bishops Thomas Lindsay (Raphoe), William Lloyd (Killala), and William King (Derry). Their position was supported by all four of the archbishops.

That same year, bishops of the Church of Ireland led the opposition to the Security Bill, which would have removed the few remaining safeguards enjoyed by the Catholic majority in Ireland. Also in 1697, King managed to create to a voting bloc in the House of Lords that almost scuppered final passage of the Treaty of Limerick. The legislation differed significantly from that agreed to by the original signatories. The measure passed the upper house by just one or two votes—the record is unclear—and King insisted on attaching a protest to the bill, which was, he said, a breach of "the public faith of the Kingdom given in the Articles of Limerick."

Once the extent of the independence of the Irish bishops became clear, the authorities in Whitehall responded by translating English

► EDWARD SYNGE AND TOLERATION

The following excerpt is from Edward Synge's sermon titled *The Case of Toleration consider'd with Respect both to Religion and Civil Government*, preached to Parliament and published in 1725. In it, he advocated limited toleration toward Catholics in Ireland, a view that was met with much criticism. Except for a treatise published the following year in which he defended himself, this would be the last time Synge would put such views into print.

"THE Governours of the Christian Church, have in no Case a Right to use Temporal Force or Coercion; That memorable Declaration of our Blessed Saviour, *My Kingdom is not of this World*, plainly cuts off all Pretence to it: And since they have not a Right themselves to use Force, 'tis plain they cannot have a Right to command or oblige the Magistrate to use it, for this is in Effect the same Thing as to have the Power of using it themselves. . . .

FROM what has been said on this Point, We may draw this very important Conclusion, That all Persons in a Society, whose Principles in Religion have no Tendency to hurt the Publick, have a Right to a *Toleration*.

BY a *Toleration*, I mean a Liberty to worship God according to their Consciences, without any *Encouragement* from the Civil Government on the

one Hand, or *Fear of Infliction of Punishment* on the other: And the Reason why all men, whose Religious Principles do not hurt the Publick, have a Right to a *Toleration*, is this, because of the Supposition, they are Guilty of no Offence against the State, and it has been prov'd that the Magistrate has no Right to use Force against them on any other Account.

He may indeed encourage his own Religion, which is no more than every other Man, as far as he has Power, does with Respect to his own Sect; He may also limit the Enjoyment of Places of Trust or Profit, to those whose Opinions in Religion agree with his own, if such a Limitation be for the Publick Good: And by doing this, he injures no Man, because he deprives no Man of any Thing, to which he has, properly speaking, a Right. But every Man whose Principles in Religion do not tend to hurt the Publick, has a right to *Liberty of Conscience*, and consequently to a *Liberty of worshipping God according to it*."

—Christopher Fauske

Source

Edward Synge, *The Case of TOLERATION consider'd with Respect both to RELIGION and CIVIL GOVERNMENT* . . . , 2nd ed. (Dublin, 1726), 15, 21–22.

clerics to the more important Irish sees whenever a vacancy occurred, the three most notable appointments being John Evans, appointed to Meath in 1716; William Nicolson, appointed to Derry in 1718; and Hugh Boulter, appointed to Armagh in 1724. Such appointments were not simply motivated by spite; in 1724, the Church of Ireland owned 5 percent of the land in Ireland and thus was a significant power in matters of economics and husbandry.

The temporal powers in Dublin Castle, who actually had to work with the Irish houses of Parliament, sought sometimes to moderate the effects of the policy of importing bishops but nonetheless looked with distrust at the group of Irish bishops led by King and, after his death, by Edward Synge (archbishop of Tuam, 1716–1741) and John Stearne (bishop of Dromore and then

of Clogher, 1717–1745), whose votes were often at odds with the administration's desires. The presence of such men in the House of Lords helped lay the groundwork for the grouping of varied interests that would become identified as the Patriot Party. These clerics who had witnessed the turmoil of 1688–1691 were heirs to the Caroline tradition that had given Anglicanism two of its great theologians, James Ussher and Jeremy Taylor, and, perhaps counterintuitively, were less concerned with Catholic threats than they were with opposing perceived increasing political interference in their activities and with what they took to be far too tolerant a view of Protestant dissent.

On the other side, clerics such as Boulter saw the Irish bishops as obstructionist and obstinate, motivated by petty frustrations at their society's

increasing integration with a Pan-British polity. In a debate over who should be appointed archbishop of Cashel, Boulter sent one letter to England; he was furious that it should be necessary even to ask “the ministry to consider who is the proper person to recommend to bishopricks here, an Irish speaker, or an English primate.” It was the adjectives rather than the nouns in that choice that Boulter thought should be decisive.

From William King’s accession to Derry in 1691 until his death in 1729 and beyond, there was a strong and consistent argument within the Church of Ireland that it had henceforward to justify its position on the merits of the debate rather than by virtue of state-sanctioned support. Such concerns brought Church of Ireland thinkers into contact with such continental philosophers as Pierre Bayle. They also helped give the ideas of Robert, Viscount Molesworth, visibility in Britain and hence in the North American colonies, particularly his seminal work *An Account of Denmark as It Was in the Year 1692*, which made it plain that state-sanctioned Protestantism could be as repressive as Catholicism.

Francis Hutcheson, the founder of the Scottish sentimental school of philosophy, which would shape British enlightenment ideas well into the nineteenth century, recognized King’s theodicy, *De Origine Mali*, as seminal in the creation of his *Inquiry into the Original of Our Ideas of Beauty and Virtue*.

Better than any other clerical family, the Synge, who produced a prodigious number of bishops and archbishops from the time of Charles I well into George III’s reign, illustrate the intellectual endeavors that were a significant part of Church of Ireland activities. One example will have to suffice, the sermon preached by Edward Synge, the son of the archbishop of Tuam, to the Irish houses of Parliament in 1725. He chose for his text Luke 14:23: “Compel them to come in that my house shall be full.” In Synge’s hands, the word “compel” becomes an appeal to win the intellectual argument. He condemned existing anti-Catholic legislation as no better than the anti-Protestant legislation to be found in Catholic countries.

Such intellectual vigor was linked to a massive campaign of church building and restoration, a consistent attack on absentee clerics and

on clerics who held multiple livings, and periodic investments in charity and poor schools as well as in the elite schools attached to cathedrals, an aspect of Church of Ireland activity strongly supported by at least some of the English-born clerics, chief among them Hugh Boulter.

The first four decades after King’s succession in Ireland represented a remarkable flourishing of Church of Ireland creativity driven by a genuine sense of Irish distinctiveness combined with an intellectual engagement with contemporary philosophical developments across western Europe. When Nicolson complained of King in 1719 that “the Angel of St Patrick’s is now guardian of the kingdom” he did not mean it as a compliment, yet this phrase better encapsulates the positives and weaknesses of the Church of Ireland at that time than any more modern commentary has yet managed.

Congregatio de Propaganda Fide

The Congregatio de Propaganda Fide (Committee for the Propagation of the Faith) was the committee of cardinals responsible, under the pope, for supervising the missionary efforts of the Catholic Church in non-Catholic countries. It was formally created by Pope Gregory XV (who served as pope during 1621–1623) on June 6, 1622, in the bull *Inscrutabili Divinae*, succeeding an earlier, more informal body or “cardinalatial commission.” The congregation consisted of 13 cardinals, 2 prelates, a secretary, and a

consultor. Like other congregations formed during the Catholic Reformation, it was part of an effort to transform the College of Cardinals from a body of semi-independent “Princes of the Church” to a group of Papal servants. The congregation was supposed to meet weekly, and like other congregations it reported directly to the pope. Church revenues were assigned to its upkeep, the mark of a permanent institution as opposed to the earlier informal grouping. Initially, its principal revenue was the ring-tax leveled on newly appointed cardinals. The congregation also benefited from pious gifts and bequests from the Catholic faithful.

The Catholic Church faced major missionary challenges in this period stemming from the Protestant Reformation, which had seen the triumph of what Catholics viewed as heresy in many formerly Catholic territories and the increased contacts of European Catholics across the globe. The congregation supervised the missionary efforts of numerous Catholic religious orders, including the Jesuits, Capuchin Franciscans, and Dominicans. It demarcated spheres of activity for different religious orders, hoping to keep conflict among them to a minimum. In the ongoing dispute between the Jesuits and the Mendicant orders—the Franciscans and Dominicans—over the proper strategy for missionary work, the congregation usually took the side of the mendicants, emphasizing the conversion of the poor rather than of the middle class and leaders of society. (There were major tensions between the congregation and the Jesuits, who were viewed as unwilling to work with other orders or bodies within the Church and too closely allied with Spain and Portugal.) The congregation also encouraged building a native clergy and Church organization and discouraged the idea that adopting Catholicism required the abandonment of all native customs and the adoption of European lifestyle and dress.

The congregation’s immense responsibilities led to an increase in its assets as well as a bureaucracy to handle the burden of its correspondence and day-to-day work. It received a missionary education center, the Collegium Urbanum from Gregory’s successor Urban VIII (pope during 1623–1644) in the 1627 bull *Immortalis Dei*. (When a cardinal, Urban had been

➤ THE CONGREGATION IN INDOCHINA

One of the congregation’s longest struggles was with the Portuguese in the Indian Ocean, who claimed the right to appoint bishops even in those territories not under direct Portuguese rule because of the *padroado real*, an agreement between the Crown and the Holy See that gave the Portuguese king the right to control the publishing of papal bulls and the right to appoint high church officials in its overseas territories. The congregation preferred to appoint its own vicars-apostolic in non-Christian territories. It had its chance to usurp the *Padroado Real* after 1640, when Portugal’s independence from Spain caused a break in relations with the Church until 1668. In 1658, the congregation appointed three French priests associated with the newly founded Paris Society for Foreign Missions: Ignace Cotelendi (1630–1662), François Pallu (1626–1684), and Pierre Lambert de la Motte (1624–1679), vicars-apostolic of the growing Christian community in Indochina. It was unusual to send secular priests—not members of a religious order—abroad as missionaries and controversial to send French priests in an area that the Portuguese viewed as their own preserve. Since neither the Portuguese nor the Protestant powers trading in the Indian Ocean, England and the Dutch Republic, would transport them overseas, the priests made the difficult journey over land. Cotelendi died in Sri Lanka along the way, but Pallu and de la Motte became founders of the Catholic Church in Siam, now Thailand. A seminary for native priests was established in Siam’s capital, Ajuthia. De La Motte founded the Lovers of the Holy Cross, a community for female religious, one of the first founded in East Asia and still in existence today.

—William E. Burns

a member of the congregation.) The Palace of the Collegio de Propaganda Fide was begun by architect Gian Lorenzo Bernini. However, Bernini was taken off the job, and the palace was completed by Baroque architect Francesco Borromini (1599–1667). The palace remains a Roman landmark to this day and is considered a gem of the Italian Baroque. The congregation also controlled a Roman printing press, known for the immense variety of fonts required to

reprint Catholic works in different languages with different alphabets.

The formation of the congregation was also an effort to divert the Catholic missionary effort from the control of Catholic states, particularly Spain and Portugal, into the hands of the papacy. Since the Spanish empire in the New World was already under a Catholic monarchy, it was outside the congregation's jurisdiction, and its foundation had little effect. The congregation was more successful in its long-term effort to wrest control over the missionary effort in the Indian Ocean and in China from the Portuguese authorities eager to subordinate the Catholic effort to Portuguese political and economic concerns. In addition to converting Protestants and non-Christians, the congregation also supervised efforts to reconcile the churches of the East, such as the Maronites, to Rome. It had jurisdiction over Eastern rite churches in communion with Rome. As the congregation's jurisdiction included all countries not officially Catholic, it also supervised territories with very large and established Catholic populations that had fallen under non-Catholic governments, such as Ireland under the Protestant English monarchy and that portion of Hungary ruled by the Muslim Ottoman Turks. In these territories, the congregation's concern was less with making conversions and more with maintaining church organization and preserving believers' access to the sacraments in the face of a frequently hostile government. Given the large distances and slow communications that separated Rome from its missions in Asia, Africa, and the Americas, the congregation was unable to exercise close supervision over missionary outposts.

The modern word "propaganda" is derived from the congregation. The congregation itself was renamed *Congregatio pro Gentium Evangelisatione* (Congregation for the Evangelization of Peoples) by Pope John Paul II in 1982.

Congregationalism in Colonial New England

At the end of the sixteenth century, an effort at religious conciliation known as the Elizabethan Settlement eased religious tensions between Catholicism and Protestantism in England. Under Queen Elizabeth I, the Church of England finally had a set doctrine and ritual, along with a law obligating every subject to attend service with the state church. While this created a compromise, it did not satisfy the fringe groups who were not happy with the religious status quo. One of these groups was the Calvinists, who would later be known as Puritans because of their desire to "purify" the Church of England of what they saw as its Catholic elements. Although these people are often lumped into one group, they did not share one monolithic belief. While they were all unhappy with the Church of England, they varied in their approaches to it. Some were willing to work with the Church in the hope that they could be a positive influence. On the other end of the spectrum, there was a more radical group of Calvinists, known as Separatists, who wished to separate themselves from the Church of England altogether.

The early reigns of both James I (r. 1603–1625) and Charles I (r. 1625–1649) gave the Calvinists hope that they would finally see the reforms they wanted. However, neither James nor Charles was willing to change the practices of the Church in order to suit the needs of the Puritans, particularly when they called for an end to the power of its bishops. Many Puritans, especially the Separatists, preferred the Congregational model of church governance, which meant that each church was made up of men and women who willingly came together to seek God's favor and who were collectively responsible for its administration, rather than leaving matters to a bishop. These Puritans saw the state-supported Church of England as a horrible mishmash of Protestant and Catholic elements. In their quest for a godly life, they wanted to break away from the oversight of what they saw

as the corrupt hierarchy of the Anglican Church, particularly its bishops and archbishops. Their congregational form of church government, however, was not to the liking of the political and religious leaders of England. It struck them as being socially disruptive and even treasonous. Therefore, certain groups of Puritans decided that they could no longer continue to remain a part of the mainstream Anglican Church, and if they wanted to practice their faith in peace, they would have to do so elsewhere. Despite these sentiments, there were still many Puritans who chose to remain in England and figured prominently in the English Civil War (1641–1649).

Beginning in 1620, groups of Puritans crossed the Atlantic and established their own colonies in New England. The group now known as the Pilgrims was made up of Separatists, and they established their colony in Plymouth, Massachusetts. The largest number of immigrants, however, were non-Separatist and settled in Massachusetts Bay. Almost at once they put their Congregationalist beliefs into practice. The result was known as the New England Way. Free of any pressure from the English state or the Anglican Church, the Massachusetts Bay Puritans made their independent congregations into the cornerstone of both their religious and political life. To join a church, each Puritan settler had to demonstrate that he or she had experienced God's grace. In other words, they had to confess that they were bound for heaven and that they could lead an orderly and moral existence. The founders of the Massachusetts Bay colony also made church membership into a voting requirement among men; women simply could not vote. In theory, godly members of the various congregations could be counted on to elect godly men to govern them. The Puritans expected this connection between church and state to make the Massachusetts Bay colony into an example of a perfect society that the rest of the world would want to follow.

Almost at once, however, the Puritans began to fear that their church was becoming corrupt. As proof of that trend, the colonists pointed to the assaults that some of their own people directed against New England Congregationalism. In the 1630s Roger Williams and Anne Hutchinson attacked the connection between

Jonathan Edwards was a theologian, philosopher, and evangelical Congregational minister who exerted an enormous influence on the course of religious history in America. (Library of Congress)

church and state, urging the settlers of Massachusetts Bay to practice religious toleration. Puritan leaders were outraged, and they expelled the troublemakers from the colony. Even that kind of decided action, however, could not halt what most colonists perceived as New England's decline into worldly compromise. By the mid-seventeenth century, many Puritans born in the colony were not experiencing God's grace. As a result, neither they nor their children could become full members of the church. In 1662 the Puritans responded to this situation with the Half Way Covenant. Men and women no longer had to experience the grace of God to join one of New England's churches. The act of baptism was sufficient, though the Lord's Supper remained the privilege of the genuinely godly. This was a major watering down of the Congregationalist ideal, even if it preserved the connection between church and state among the Puritans.

The New England colonists continued the painful process of altering their ideal church structure to account for reality during the

THE JEREMIAD

The collapse of the Puritan effort to transform Congregationalism into a model for the rest of humanity had an important impact on New England culture. It produced a unique form of sermon known as the Jeremiad.

The Jeremiad was named for the grimmest of the Old Testament prophets: Jeremiah. In the hands of New England's ministers, it became a catalog of the ways that the colonists had displeased God and how God had punished them for their sins. The Puritans interpreted any type of misfortune as a sign that New England was slipping further out of divine favor. To avoid these calamities in the future, the preachers urged their fellow Puritans to follow the example of the founders of the colonies. Over time, however, preachers who employed the Jeremiad falsely implied that the

original settlers of New England had been men and women of sterling virtue who had created something close to a perfect church in their new home. It was an example that no society, dealing with the realities of colonial life in the seventeenth and eighteenth centuries, could hope to emulate. In the end, the Jeremiad contributed to the growing sense of disappointment and failure among the later generations of Puritans. Literary historian Sacvan Bercovitch, in *American Jeremiad* (1980), argued that the genre of the Jeremiad in which the American people's shortcomings are decried yet set guideposts for fulfilling the country's true promise and destiny that can be traced beyond the Puritan pulpit to writers and orators such as Henry David Thoreau, Walt Whitman, and Martin Luther King.

eighteenth century. The greatest challenge to the Puritan vision came in the 1730s and 1740s in the form of a religious revival directed by respectable ministers, such as Jonathan Edwards, and more freewheeling preachers, such as George Whitefield. These revivalists called on the men and women of New England to admit their sinfulness and to welcome God into their souls. This message may have swept new people into the churches, but it also split many congregations into hostile factions. Some of the revivalists' more enthusiastic followers left Congregationalism entirely and found a new home among groups like the Baptists. Those who remained in the old Puritan churches divided between New Lights, who supported the revival, and Old Lights, who thought that mass conversions were a danger to church and society, based as they were on wild and sometime uncontrollable emotionalism. This faction-ridden version of New England Congregationalism would have been unrecognizable to the men and women who crossed the Atlantic in the early seventeenth century to establish a perfect world.

Puritans and Protestantism

"Puritan" was the name given to the most extreme Protestants within the Church of England, generally people who did not believe that the English Reformation of the sixteenth century had done enough to "purify" the Church of its Catholic rituals, traditions, and doctrines. This complex group of Protestants first came to be known for their critical reactions to the broad comprehensive religious settlement of Elizabeth I (known as the *via media*, or middle way). Beginning in England as a general reactionary group, Puritans eventually separated into more distinct factions, some of which became so discouraged by the slowness to reform that they migrated to the New World. Many of this group settled in various colonies that ultimately would become the United States.

Generally, Puritans encouraged a simpler and more direct approach to worship styles, rejecting much of the traditional liturgy that still remained in the reformed Church of England. Indeed, more than any other issue, worship style was what attracted Puritan reform efforts. The traditional Roman Catholic Mass had been modified by the English reformers of the sixteenth century, but for Puritans too much of the old ritual remained. These beliefs about worship were rooted in strong theological foundations about the simple eloquence of the Christian experience and man's relationship to his God. Even though Puritanism is not exclusively or singularly associated with any one reformed theological school of thought, many English Puritans were Calvinist in their doctrines. The theological roots of Puritanism can generally be found in the various strains of reformed theology from the continent of Europe, and it is likely that earlier English theologians such as John Wycliffe and his Lollard movement of the fourteenth century may also have had an intellectual influence on the movement. For Puritans, all of humankind was dependent upon God for salvation, and they therefore sought a simple form of preaching and worship to emphasize the importance of that relationship.

The reign of Elizabeth I provided a religious atmosphere that was conducive to toleration of broad extremes. Many prominent men in the Elizabethan government were Puritans

including Sir Francis Walsingham, who served as Elizabeth's secretary of state. After her death in 1603, religious pressures brought by Puritans against King James I and his successor, Charles I, ultimately brought about dramatic political changes for England. One of the earliest and most consistent demands made by Puritans was for England to abolish the episcopacy, which led to James I making a famous statement in refusal: "No bishop, no king!" James I made only one significant concession to Puritan demands, which was to appoint a commission to undertake a new English translation of the Bible. The King James Version first appeared in print in 1611.

Because of the reluctance to reform on the part of the English monarchy, many Puritans began to immigrate to the New World. By the middle of the seventeenth century, distinct Puritan factions began to emerge, with some more radical than others. Most Puritans favored Presbyterian-style church governance over the Episcopal (bishop) model and tried to reform the Church of England from within, but Separatists sought to completely separate and disengage from the Church of England. Independent Puritans sought a congregational model for local churches that minimized the impact of a national church. Many of the early immigrants to the New World from England were disaffected Puritans who saw no hope of further reformed religious expression within the English Church. Many of those who stayed in England formed a

➤ SOCIAL CHANGES IN PURITAN ENGLAND

Under the Puritan influence of the seventeenth century, England witnessed some rather dramatic social changes resulting from religious dominance in directing domestic policy and regulating public behavior. An act of Parliament outlawed the observance of Christmas as a holiday, because the festival originated with an ancient pagan observance related to the winter solstice. William Shakespeare's famous stage and venue for his plays, the Globe Theatre in London, was closed. The government closed all pubs and brothels and enacted strict laws concerning leisure activities such as gambling and hunting. All of these measures were largely unpopular, but perhaps none elicited a

stronger reaction among the populace than the banning of Christmas observances. In 1647 riots broke out in several places throughout England as Puritan authorities reminded citizens that it was illegal to keep the superstitious traditions related to the Christmas holiday. The Puritans of New England were equally zealous in their attempted suppression of Christmas, as the Massachusetts Bay Colony also outlawed its celebration. The reaction of Puritanism against Christmas is an extreme example but is representative of the core belief of "purifying" the Christian faith and ridding it of all pagan and medieval influences.

—Cheryl H. White

powerful political element within the English Parliament that led to the English Civil War.

At issue during the English Civil War were which form of church governance would dominate and what type of national government should be in place. The Parliamentary army (known as the Roundheads), led by a country squire named Oliver Cromwell, defeated the forces of Charles I (the Cavaliers) during the war. Following the king's defeat, he was brought to trial for treason and executed in January 1649. Until the Restoration of the Monarchy in 1660, England was a Puritan nation, ruled by a Protectorate under Cromwell until his death in 1658. This period also witnessed the Puritan abolition of the office of bishop. This time in English history is known as the Interregnum. The Restoration of the Monarchy with Charles II in 1660 also restored the Church of England and the episcopacy, but the Puritans continued to be a political faction within the English Parliament and played a role in carrying out the Glorious Revolution of 1688 that brought Protestants William of Orange and Mary II to the English throne.

When Puritan groups separated from the Church of England in the seventeenth century, many of them settled colonies in the New World. Among these was the group that settled the Plymouth Bay Colony in Massachusetts in 1620. While the Puritans extended religious influence in almost all of the English colonies of the North American Atlantic seaboard, it was in New England that their influence was most prominent.

Many Congregationalist churches in the English Puritan tradition that were planted there in the seventeenth century continue to flourish today. Early leaders of this Puritan settlement initiative in Massachusetts included such men as Richard Mather and John Cotton.

Because a central element of Puritanism was the belief that God's divine election had preordained the chosen to direct political affairs, they claimed that they alone had the ability to interpret the meaning of Holy Scripture as it related to societies. This union of church and state seemed to mirror the national model of the Church of England of which they had been vocally critical and resulted in giving these groups exclusive control over the colonial environment. Throughout the colonial period of the United States, Puritanism had profound and lasting impact on religious thought and on social and cultural developments as well. The point at which Puritanism ceased to be the dominant social and cultural influence is difficult to assess, but most scholars agree that Puritan ideals continued to exert influence into the nineteenth century.

Science and Technology

The early modern period was a time of unprecedented scientific and technological advance, driven both by factors within civilizations and by the contacts between them. Technology and science also spread between civilizations with unprecedented rapidity, although technology proved much more able than science to overcome cultural barriers.

The diffusion of Chinese technology, which had begun centuries earlier, continued to work transformative effects. When the English philosopher of science Francis Bacon wrote about what distinguished his own modern times from the earlier world, he identified the technologies of printing, gunpowder, and the magnetic compass, all originally Chinese, although printing was probably invented independently in Europe. World science and technology were further transformed by the greater contacts between civilizations, driven primarily by European expansion in the early modern period. Geographical and ethnographic knowledge exploded, with continents previously unknown to Europeans and Asians added to their base of geographic knowledge. In natural history, Europe received a flood of new information and even specimens of previously unknown plants, animals, and stones from the newly encountered areas of the world. Although European explorers and conquerors were the primary transmitters of the knowledge of indigenous people throughout the world, it did not remain restricted to Europe. Cartographers from other civilizations learned of the new geographical discoveries, and the new American crops such as corn, tobacco, and tomatoes spread in many areas of the Old World, bringing new technological challenges and solutions with them. Expansion itself created new problems and solutions such as in the field of navigation, which underwent revolutionary changes in this period.

As has often been true in world history, few forces were more powerful than war in spreading new technologies. Gunpowder weaponry, having first spread from China to Europe during the Middle Ages, became a global phenomenon in the early modern period and was used by peoples ranging from the Ottomans, Mughals, and Safavids—the Islamic “gunpowder empires”—to Native Americans and often forcing radical political and social reconstruction along with the creation of new militaries. Only Tokugawa Japan, with its rigorously maintained isolation, was able to “give up the gun” and revert to an earlier stage of military technology.

Commerce was another powerful force behind the technological development and the transfer of technology between regions. Europeans were fascinated by the porcelain of East Asia—a highly profitable luxury good—and in the early eighteenth century finally figured out

how to replicate it at home. Countries tried to guard their technological secrets, often forbidding the emigration of technologically skilled workers, like the famous Venetian glassmakers. Despite restrictions, however, workers were often recruited to bring technical skills with them, like the German miners recruited by colonial American landowners who had discovered profitable deposits of ore on their lands.

By far the most dynamic center of scientific development in the early modern period was Europe, particularly western and northern Europe. The Islamic tradition, the world's most advanced scientific tradition for centuries, fell increasingly behind, although historians still debate the degree to which the decline of Islamic science was an absolute decline or whether it was merely a relative decline compared to the rapidly accelerating Christian European tradition. These early modern changes in European science are often referred to collectively as the Scientific Revolution and treated as the foundation of modern science. As a revolution, the process was marked by the overthrow of the authority of the ancient Greek natural philosophers, astronomers, and physicians. In content, astronomy moved from the earth-centered universe of Ptolemy and Aristotle to the vaster sun-centered universe of Copernicus, Kepler, and Galileo. In physics, qualitative Aristotelianism was replaced by mechanical Cartesianism and then by mathematical Newtonianism. Changes in astronomy and physics were the most dramatic and far-reaching during the period, but important transformations also happened in other fields. In medicine, the tradition deriving from the ancient Greek physicians Galen and Hippocrates was challenged by a plethora of new anatomical discoveries, the most dramatic being William Harvey's discovery of the circulation of the blood, and by the rise of chemical and mechanical theories of bodily function.

Although these new scientific developments flowered in Europe, their roots lay in many other civilizations as well. The Arabic tradition in astronomy, mathematics, and medicine was an important foundation. The Scientific Revolution is unimaginable without the European adoption of the Indian system of numerals including the zero, acquired through Europe's contacts with the Islamic world. Despite its overthrow of ancient authority, the new science built on the old. The idea of a careful rigorous investigation of the natural world had been established

in European intellectual life by the revival of Aristotelianism in the twelfth century and work that went beyond Aristotelian physics at several European universities by the end of the thirteenth century. The Renaissance humanist revival of other ancient philosophical schools—Platonist, Epicurean, Skeptical, and Stoic—also stimulated new thinking about the natural world. Early modern scientists often presented themselves as restorers of the

Early modern scientists often presented themselves as restorers of the past; the French priest and natural philosopher Pierre Gassendi presented his atomistic theory of matter as the revival of the philosophy of Epicurus.

past; the French priest and natural philosopher Pierre Gassendi presented his atomistic theory of matter as the revival of the philosophy of Epicurus. Similar processes were happening in other early modern

societies. Like Renaissance humanists recovering ancient philosophies but to a lesser degree, the *kaozheng* Confucian revivalism of eighteenth-century China stimulated investigation of the natural world. As Gassendi found the roots of his atomism in the ancient wisdom of Epicurus, Mei Wending, a late-seventeenth-century Chinese scholar, argued that the “Western” science recently introduced to China by European Catholic missionaries was originally Chinese knowledge that had traveled westward but had been lost in its homeland due to the many wars of early Chinese history and had only now returned to China.

The new Western science was not a monolith. Like other revolutionaries, the makers of the Scientific Revolution quarreled fiercely among themselves over everything from different claims to priority in a discovery to the role of the Bible in scientific questions. The enemies of Galileo Galilei, for example, who engineered his silencing in 1633 for championing against the Bible the Copernican theory that the earth rotates around the sun, included astronomers as well as theologians. Debates between Newtonians and Cartesians and “chemical” and “mechanical” medicine continued into the eighteenth century.

From Europe, these new discoveries and theories made their way to European colonies, greatly aided by printing. By the mid-eighteenth century the American colonies had produced one scientist of remarkable distinction, Benjamin Franklin, as well as a literate scientific public. Franklin’s interest in electricity was sparked by reading an English magazine that reprinted a translation of a work by a Swiss published in a French-language Dutch periodical describing the work of three German electrical scientists, remarkable testimony to the international world of eighteenth-century science.

The spread of the new European science to other societies was usually much slower, although Russia adopted European science and established scientific institutions in great haste as part of its drive to modernize under Tsar Peter the Great. The Society of Jesus, a powerful force in the development of worldwide science, introduced Western astronomy and cartography as well as other disciplines into China in the seventeenth century. The Japanese acquired scientific knowledge both from Chinese-language texts, many of Jesuit origin, and directly from the Dutch trade colony at Deshima. The spread of European science into the Islamic world was much slower, but by the early eighteenth century the Ottomans, Europe’s closest Islamic neighbor, had some access to it. Although the spread of European science was the most dramatic, it was not the only scientific tradition spreading across civilizations in the early modern period. Seventeenth- and eighteenth-century Japan saw heightened interest in Chinese natural philosophy, while the last great astronomical observatories in the Islamic tradition were built in the early eighteenth century by an Indian Hindu ruler, Jai Singh.

With the dramatic intellectual changes of the Scientific Revolution, science assumed a much more central institutional cultural role in Europe. Scientific institutions spread across Europe in the seventeenth century, developing from the temporary and informal Italian groupings, the Accademia dei Lincei and the Accademia del Cimento, into the permanent institutions of England and France founded in the 1660s,

the English Royal Society and the French Royal Academy of Sciences. By the eighteenth century this network of societies could coordinate truly global projects, such as the measurements of the transits of Venus across the face of the sun in 1761 and 1769. Meetings of scientists and networks of correspondence were supplemented by printed periodicals: England's *Philosophical Transactions*, the French *Journal des Savants*, and the myriad of more popular magazines that brought news of the new science to a broad European and colonial public, male and female. New scientific instruments, such as the telescope, the microscope, and the air pump, were found in the hands of more and more men and women. Museums and botanical gardens, collecting natural items from all over the world, became popular visiting places. Experiments, which played only a very minor role in science before the Scientific Revolution, were now not only essential to scientific work but were also presented to curious audiences by lecturers and demonstrators as a form of intellectual entertainment.

—William E. Burns

■ Introduction: Renaissance to the Scientific Revolution

The European Renaissance of the fifteenth and sixteenth centuries helped set the stage for the scientific revolution that reached its height in the seventeenth century. Renaissance humanists in their fascination with classical antiquity revived, translated, and published numerous ancient Greek texts of science, natural philosophy, mathematics, and medicine. They sought out surviving manuscripts of ancient Greek and Latin works from libraries and made them available to a wide public with the help of the printing press, invented in the mid-fifteenth century. The humanist movement was also greatly aided by the immigration of Greek scholars and manuscripts to the West, prompted by the decline of the Byzantine empire and its fall to the Ottoman Turks in 1453. Most early modern scientists had some humanist education, and humanistic Latin provided an “international language” that enabled scientists from different countries to communicate with each other before the rise of French in the late seventeenth century. The legacy of scientific Latin persists to the present day in the scientific names of plants and animals.

Humanists wished to recover and create improved texts of the Greek authorities in the

sciences, including Aristotle in natural philosophy and biology; Ptolemy in astronomy, astrology, and geography; Euclid, Archimedes, and Apollonius in mathematics; Strabo in geography; Theophrastus and Dioscorides in botany; Plato and Hermes Trismegistus in natural theology; and Galen and Hippocrates in medicine. Although humanists read Aristotle with care, they often opposed or simply disregarded the Aristotelianism of the European universities, which rested on a limited number of texts, not all of them the authentic work of Aristotle, and presented Aristotle with an elaborate body of commentaries by Arabs and medieval professors. Although ancient Roman writers did not have the same intellectual authority as Greeks, there were also important scientific aspects to the study of Pliny the Elder in natural history, the Stoic philosopher Seneca, the epic poets Lucretius and Ovid, the engineer Frontinus, and the medical encyclopedist Celsus.

The reverence of humanists for ancient Greek and to a lesser extent Roman authorities was exceeded only by their contempt for medieval Latin and Arab writers. Humanists valued Arab writers such as Avicenna only for the light

they shed on the Greeks and Greek writings that had been lost. However, the university tradition that valued these earlier writers continued alongside humanism.

By the sixteenth century, professional humanists were spending much of their time editing ancient texts and trying to recover their exact meaning in their original context. Given all the corruptions introduced by the copying and recopying of manuscripts over the centuries and the differences between different manuscript traditions, humanist editors often had to use scientific knowledge to reconstruct the wording and meaning of the texts. The reconstruction of ancient calendars was an enormously demanding task, requiring elaborate and detailed astronomical and philological research. The Italian mathematical humanist Federigo Commandino (1509–1575) translated many Greek mathematical works into elegant Latin, greatly contributing to the advance of mathematics. Many sixteenth-century botanists were mainly concerned with identifying the plants described by the ancient botanists and sometimes even apologized in their writings for the inclusion of plants unknown to the ancients!

Humanists revived various non-Aristotelian schools of ancient philosophy as live intellectual options. The ancient tradition offered so many possibilities that there was little interest in rejecting it totally. Galileo Galilei flaunted his contempt for Aristotelian physics but invoked Archimedes as an alternative Greek role model (and owed more to Aristotelian logic than he cared to admit). There was a long-standing humanist interest in Plato, nearly all of whose writings had been unavailable to the medieval West, as the greatest of the Greek sages. Epicurean atomism, most notably represented in Lucretius's frequently translated and reprinted Latin poem *On the Nature of Things*, also attracted interest from mechanical philosophers, although its alleged connections with atheism made it religiously suspect. Stoic natural philosophy also had its modern champions. Even the radical heliocentrism of Nicolaus Copernicus had ancient precedents in the thought of Aristarchus and Pythagoras.

As the humanists recovered more knowledge of the particular context in which ancient thinkers worked, their limitations became more

evident. Aristotle, for example, was not the “master of those who know” praised by medieval poet Dante Alighieri but instead was a particular man working in a particular time. Modern knowledge, such as the discovery of the Americas, also brought out the partial and limited nature of ancient thought. The study of antiquity itself became more “scientific” during this period, with intellectual triumphs such as the Huguenot scholar Isaac Casaubon's 1614 demonstration from linguistic evidence that the magical and theological writings of Hermes Trismegistus dated from the first Christian centuries rather than from the time of Moses. The Confucian *kao-zheng* scholarship of China, with its emphasis on rigorous textual research, offers a parallel.

Man Apart—The Renaissance

The cultural and organizational transformation that began in Italy during the fourteenth and fifteenth centuries and eventually spread to the rest of Christian Europe is customarily referred to as the Renaissance, connoting a rebirth of the classical civilization of the Greeks and Romans. Although the term “Renaissance” is an invention of the nineteenth century, the idea that the civilization of the ancients was being revived goes back to the Renaissance period itself.

Northern Italy was the center of Renaissance culture. It was in cities such as Florence, Rome, and Venice that scholars rediscovered and re-examined ancient architecture, art, and music. These were the centers of efforts for recovery of lost works of art, manuscripts, and coins (the collecting of which was a major cultural movement during the period). The Italian city-states

Andrea Palladio's Villa Rotunda, Vicenza, Italy, sixteenth century. (Tom Perkins)

themselves were more similar to classical Greek poleis and Republican Rome than were any other late medieval polities. They became the focus of political experimentation, including an abortive attempt to revive the Roman Republic by Cola di Rienzo, a friend of Francesco Petrarca (1304–1374), and other Renaissance writers. The praise that Cicero, Aristotle, and other classical authors gave to civic involvement was congenial to city-state leaders, particularly before the later fifteenth century when republican governments were overthrown by autocrats who eventually gave way to rule by foreign princes.

One of the most important aspects of the revival was linguistic. Many humanists, as these writers were called based on their concentration on human rather than divine subjects, placed particular emphasis on ancient rhetoric, a subject largely ignored in medieval universities. They saw themselves as returning to the classical Latin of the ancients, particularly to the rhetoric of the Roman orator and philosopher Cicero, instead of the so-called corrupt Latin of the Middle Ages. Indeed, the term “Middle Ages” was itself a Renaissance invention, popularized by the first important Renaissance writer, Petrarca. The craze for the revival of classical Latin culture led to the recovery of lost ancient texts moldering away in monastery and cathedral libraries. The Latin classics rediscovered in this period include the works of the rhetorician Quintilian and the *Germania* of Tacitus. The invention of printing in the middle of the fifteenth century also meant that these texts could be circulated on a far wider scale than ever before.

Study of the Latin classics led inescapably to awareness of the dependence of the Latins on the Greeks. At the same time that Western interest in learning ancient Greek was growing, the decline of the Byzantine Empire in the East led to an exodus of Greek scholars and manuscripts to the West. The arrival in Italy of learned Greeks such as the Platonic scholar Basilios Bessarion began well before the final fall of the Byzantine capital Constantinople to the Ottoman Turks in 1453. Bessarion, who translated Aristotle's *Metaphysics* into Latin, actually rose to be a cardinal of the Catholic Church and at one point a candidate for the papacy. The fact that these scholars brought Greek manuscripts with them was also important. Many ancient classics, including nearly all of Plato, had never been translated into Latin and were thus unknown to the medieval West.

Another important aspect of the Renaissance was in the arts. Renaissance artists and art theorists urged abandoning the medieval idea that art was an attempt to stir the passions through the creation of striking images in favor of thinking of art as the accurate representation of human activity in the world. This ultimately led to the invention of perspective, conceived as an accurate way to represent three-dimensional space on a two-dimensional canvas. An even more emphatic rejection of medievalism past took place in architecture, where scholars and architects such as Andrea Palladio (1508–1580) condemned the Gothic style as barbarous and sought to restore classical ideas of harmony and balance.

One problem for Renaissance writers and artists was the relationship of the pagan writers and artists whose work they admired to the Christian culture of their own time. The revival of classical culture went along with a veneration of classical heroes such as Julius Caesar and an individualist emphasis on seeking imperishable fame rather than the salvation of the soul. Everyone from Italian mercenaries to Spanish conquistadors in America presented their careers in the mold of classical warriors. Few Renaissance thinkers went so far as to condemn Christianity or advocate paganism, although the Florentine historian and political theorist Niccolò Machiavelli (1469–1527) thought that classical paganism was more suited than Christianity for effective rulers.

Many argued that classical values and Christian values could be reconciled and that knowledge of the classics could make better Christians. This attitude is particularly associated with the so-called Northern Renaissance, the expansion of the Renaissance outside Italy to Germany, the Netherlands, France, Britain, and Spain in the late fifteenth and sixteenth centuries. The Fleming Desiderius Erasmus (1469–1536), the pious scholar and writer who was the most celebrated leader of the Northern Renaissance, applied humanistic critical techniques to recover the original form of early Christian texts, including the Bible. Religious humanism led to an interest in Hebrew alongside Greek and Latin. Renaissance humanists were found on both sides of the divide in Christendom after the Protestant Reformation.

Although Renaissance artists spent more effort on secular art such as portraits or scenes from classical mythology and history than had their medieval precursors, they also devoted considerable efforts to the creation and adornment of churches and other religious sites, the most famous example being Michelangelo Buonarroti's painting of the Sistine Chapel in Rome.

Creating a New World— Copernicus, Brahe, Kepler, and Bruno

Medieval European cosmology presented a physical picture of the universe with the earth at its center while the sun, moon, and planets were embedded in vast rotating crystalline spheres that rotated around the center, thus tracing circles around the earth. The stars were embedded in another outmost sphere. In order to make this picture fit the data of astronomy, however, adjustments had to be made. Observations revealed that the planets did not move as if they were

traveling with a uniform circular motion. Various mathematical devices had to be introduced to fit the data, among them the idea that the spheres that actually carried the planets were centered on a point near but not identical with the earth (i.e., they were “eccentric” to the earth). Epicycles were points on the circle that the planet orbited around while being carried on the larger circle, and equants were points other than the center of the sphere relative to which the sphere's motion was uniform. Together, they made the picture become even more complex. The geocentric system is also called the Ptolemaic system after the Greek astronomer Ptolemy (100–170 CE), who originated much of it.

The Polish priest and astronomer Nicolaus Copernicus (1473–1543) adjusted this received picture in his *On the Revolutions of the Celestial Spheres* (1543), getting rid of the equants by centering the motions of the planets on the sun rather than the earth. However, the Copernican system otherwise closely resembled the traditional one, down to the spheres carrying the planets, the epicycles, and the circular orbits; indeed, Copernicus viewed the greater circularity of his system as an advantage over Ptolemy's. Copernicus's theory at first gained few supporters, partly because it seemed to contradict the Bible but more importantly because it contradicted Aristotelian physics, which relied on an earth-centered cosmos to which heavy objects fell because they sought their natural place at the center of the universe. The fact that the apparent relative positions of the stars did not move when the earth moved—the lack of “stellar parallax”—also forced Copernicus and subsequent Copernicans to posit a much larger universe, with the stars at a much greater distance from earth than was commonly accepted at the time. For these and other reasons, only about a dozen sixteenth-century thinkers can be identified as accepting Copernicanism as a true picture of the universe. However, some adopted Copernicanism as a way to calculate planetary positions without endorsing it as an accurate description of physical reality.

The gravedigger of the celestial spheres was not Copernicus but rather the Danish nobleman and astronomer Tycho Brahe (1546–1601), an opponent of Copernicanism. Tycho argued that comets were heavenly bodies rather than, as

► THE NEW STAR OF 1572

A star bright enough to be seen in the daytime appeared in the constellation of Cassiopeia in early November 1572. It steadily dimmed, disappearing from sight by March 1574, but it made a remarkable impression. Europe's astronomers and cosmologists debated its nature and whether it was positioned above or below the sphere of the moon. A superlunary new star dramatically challenged the Aristotelian distinction between the perfect and unchanging world beyond the sphere of the moon and the imperfect and corruptible one below it.

Tycho Brahe published most extensively on the star. Brahe's first publication, *On the New Star* (1573), combined a record of his observations, a demonstration of the new star's position in or near the sphere of the fixed stars, and an astrological interpretation of its meaning. Although not widely distributed, this work contributed to making Tycho's reputation among astronomers, and he returned to the subject throughout his career. The English Copernican Thomas Digges's (ca.1546–1595) publication on the comet combined the most accurate observations of the new star after Tycho's with a plea for the Copernican system. The leading Ptolemaic astronomer, the Jesuit Christoph Clavius, also held that the new star demonstrated the corruptibility of the heavens.

—William E. Burns

Aristotelians would have it, disturbances in the atmosphere. Heavenly comets had to cross the celestial spheres in which the planets were embedded to reach the sun and were clearly incompatible with solid crystalline spheres. Tycho's fully developed view of the planetary system, the Tychonic system, put the earth at the center, with the sun and moon orbiting the earth while the other planets orbited the sun. This offered the same mathematical advantages as Copernicanism without challenging either the Bible or Aristotelian physics. The Tychonic system and variations such as the semi-Tychonic system, which combined a Tychonic planetary system with a rotating earth, became very popular, supplanting the Ptolemaic system as the chief rival to Copernicanism. The late sixteenth century also saw a revival of interest, even among

Ptolemaic astronomers, in ancient Stoic and Epicurean theories that held that the planets were not embedded in spheres but instead traveled like fish in the sea or birds in the air.

The next great blow to the traditional picture was that of the German astronomer Johannes Kepler (1571–1630), who had imbibed Copernicanism from his teacher Michael Maestlin (1550–1631). Kepler's outstanding mathematical skills combined with Tycho's excellent observational data to form the basis of a modified Copernican system. Kepler abandoned celestial spheres and replaced Copernicus's circular orbits with ellipses, with the sun at one focus. This enabled him to completely abandon epicycles and show planetary motion as a smooth and continuous curve. The prejudice in favor of circularity was ingrained (even Kepler thought that the universe as a whole was spherical) though, and the other leading Copernican of the first half of the seventeenth century, Galileo Galilei, did not accept Kepler's elliptical innovation. Neither did many technical astronomers, for whom the mathematical power of Kepler's theories, not the accuracy of their depiction of physical reality, was the central consideration. Technical astronomers, who viewed Kepler's astronomical tables, the *Rudolphine Tables* (1627), as the best available, were not necessarily interested in the theory behind them. Kepler's theory also faced the difficulty of explaining how and why the planets moved in their ellipses. Kepler had viewed the planets as alternately pushed and pulled by the sun's magnetic force. This explanation proved unconvincing, particularly as experiments with actual magnets showed that they could not make other magnets rotate around them.

While they displaced the earth from the center of the universe, Copernicus and Kepler still placed the solar system in a central position. One of the few to challenge this idea was the Italian friar and magician Giordano Bruno (1548–1600). Although he did not have the observational and mathematical skills of an astronomer, Bruno was one of the very few sixteenth-century natural philosophers who took Copernicanism as an accurate description of physical reality rather than a mathematical scheme for making astronomical calculations. He went beyond Copernicus, though, in setting forth the idea, which had

ancient precedents, of an infinite universe full of stars like the sun with planets orbiting around them. Bruno denied that celestial spheres carried the planets in their orbits and criticized Copernicus for retaining them. However, Bruno was unable to come up with an alternative explanation for planetary motion. Bruno's execution for heresy in Rome, although not caused by his astronomical views, tended to bring them further into disrepute among Catholics.

Galileo's World—Europe's Scientific Revolution

Nurtured in the universities of Europe, the Scientific Revolution marked the beginning of modern science with its method of experimentation to test hypotheses. This new method differed from the medieval tendency to cite traditional authorities to advance a new idea. Calling into question the dependence on ancient sources, the Scientific Revolution offered a modern understanding of the universe.

Before the fifteenth century, Europeans believed in a geocentric universe, one with the earth at the center and the sun and planets revolving around it. The Greeks Aristotle and Ptolemy of Alexandria had taught geocentrism, and their authority in this matter was above reproach during the Middle Ages. The voyages of the fifteenth century, however, revealed flaws in Ptolemy's geography, opening his cosmology to scrutiny. More critical of ancient authorities

than was the Renaissance, the Reformation of the sixteenth century created a climate in which a person could criticize Aristotle and Ptolemy. In opposition to them, Polish astronomer Copernicus revived the heliocentrism of Greek astronomer Aristarchus of Samos. By putting the sun rather than the earth at the center of the universe, Copernicus found that he could simplify an explanation of the orbits of the planets and, believing the universe to be inherently simple, advanced this view in *On the Revolution of the Heavenly Spheres* (1543). Fearing that the Catholic Church might retaliate against him for contradicting geocentrism, he resisted publishing *the Heavenly Spheres* during his lifetime. Only after his death did it appear in print.

Elegant though it was, Copernicus's system failed to predict the orbits of the planets with precision. The difficulty lay in his ascribing circular orbits to the planets. Aware that Copernicus's system was imperfect, Danish astronomer Tycho Brahe sought a compromise between geocentrism and heliocentrism. He put the earth at the center of the universe and the sun and moon

Galileo's diagram of the Copernican (heliocentric) system of the universe, and also showing his own discovery of the four moons of Jupiter, from Galileo Galilei *Dialogo*, 1632. (Jupiterimages)

➤ UNSIGNED LETTER, *ON THE REVOLUTION OF THE HEAVENLY SPHERES*, 1543

The 1543 Edition of Copernicus's *On the Revolution of the Heavenly Spheres* included an unsigned letter as a preface.

Briefly mistaken as Copernicus's own work, it was actually written by Lutheran theologian Andreas Osiander (1498–1552) who helped bring the manuscript to publication. The letter indicates some of the concerns that Copernicus's supporters felt they needed to address.

"Since the newness of the hypotheses of this work—which sets the earth in motion and puts an immovable sun at the center of the universe—has already received a great deal of publicity, I have no doubt that certain of the savants have taken grave offense and think it wrong to raise any disturbance among liberal disciplines which have had the right set-up for a long time now. If, however, they are willing to weigh the matter scrupulously, they will find that the author of this work has done nothing which merits blame. For it is the job of the astrono-

mer to use painstaking and skilled observation in gathering together the history of the celestial movements, and then—since he cannot by any line of reasoning reach the true causes of these movements—to think up or construct whatever causes or hypotheses he pleases such that, by the assumption of these causes, those same movements can be calculated from the principles of geometry for the past and for the future too. This artist is markedly outstanding in both of these respects: for it is not necessary that these hypotheses should be true, or even probably; but it is enough if they provide a calculus which fits the observations."

in orbit around the earth as had Aristotle and Ptolemy, but Brahe put all of the other planets in orbit around the sun, as had Copernicus. Brahe's pupil Johannes Kepler rejected this hybrid and, sure that Copernicus was right, sought to refine his system. Dissatisfied with Copernicus's circular orbits, Kepler cast about for other geometric shapes, finally hitting upon the ellipse. The sun was not at the center of the universe but rather at one focus of the ellipses that described the planetary orbits.

The heliocentrism of Copernicus and Kepler drew strength from Italian astronomer and physicist Galileo Galilei, whose contributions fall into two categories. First, Galileo turned a telescope to the sky and discovered the moons of Jupiter. Because Jupiter is a planet, the Earth, which also has a moon, must likewise be a planet rather than a stationary object, he surmised. Second, Galileo replaced Aristotle's notion of impetus with the modern concept of inertia. According to Aristotle, a thrower imparts impetus to an object, giving it motion. While not far from the truth, the notion of impetus struck Galileo as vague. Instead, he

proposed that objects have inertia. In his experiments, Galileo quantified the acceleration of an object, giving new precision to the study of motion. Faultless though his science was, Galileo misjudged the reaction of the Catholic Church. In asserting heliocentrism in his *Dialogues on the Two Chief Systems of the World* (1632), he encountered the opposition from Church officials that Copernicus had feared. Pope Urban VIII brought Galileo before an inquisition, forcing him to recant the idea that the Earth was a planet and sentencing him to live his last years under house arrest.

The study of motion culminated in the work of British physicist and mathematician Isaac Newton. In *The Mathematical Principles of Natural Philosophy* (1687), Newton formulated the law of gravity to account for the facts both that objects fall to the ground and that the planets stay in orbit around the sun rather than fly off into space. In unifying terrestrial and celestial motion, he demonstrated that the same physical laws operate throughout the universe. Like Galileo and French mathematician and philosopher René Descartes, Newton labored to

quantify motion in the belief that the universe displayed mathematical regularity.

The Scientific Revolution fired the imagination of poets and intellectuals. British poet Alexander Pope glorified the achievements of Newton, and the philosophes of the Enlightenment saw the Scientific Revolution as a model of progress. Inherent in the notion of progress was a faith in the power of science to better the lives of ordinary people. This faith in science spilled over to eighteenth-century America, where Thomas Jefferson and Benjamin Franklin espoused the belief that science could advance the public good. The creation of a small band of intellectuals, the Scientific Revolution had by the eighteenth century spawned a popular movement that championed the utility of science.

A New World Order— Newton's *Principia* and Bowditch's *Navigator*

Isaac Newton (1642–1727) published *Principia Mathematica Philosophiae Naturalis*, often referred to as *Principia (Mathematical Principles of Natural Philosophy)* in 1687. For centuries later, it was the most important text in physics. The title itself was a departure in Western scientific thought in bringing together quantitative mathematics and hitherto primarily qualitative natural philosophy. Published at the prompting of Newton's ally Edmond Halley, *Principia* set forth the scientific ideas still most associated with Newton. These included his law of universal gravitation—an attractive force between bodies varying directly with the mass of the bodies and inversely with the square of the distance—and his three laws of motion: a body at rest or

in motion in a straight path will tend to stay in that state, a change of motion in a body varies with the force impressed, and each action has an equal and opposite reaction. Newton's laws applied to both the heavens—they explained why the planets moved in elliptical orbits around the sun—and to earthly phenomena such as falling bodies and the tides. His conception of physics as the search for laws that could be expressed mathematically and would apply universally dominated the subsequent development of the science and also influenced other sciences.

The *Principia* was a difficult text, requiring advanced mathematical knowledge that few Europeans were equipped to understand. Written in Latin, it was aimed at a Europe-wide audience of the learned rather than simply at Newton's English contemporaries. (An English translation did not appear until 1729.) Its difficulty was one reason that its initial impact was limited. Another was the strength of Cartesian physics based on the science of the French philosopher René Descartes. Although Newton's mathematics won universal admiration from those qualified to judge it, others were suspicious of the ability of the gravity he described to bring two bodies together across a distance without anything connecting them. Admitting the existence of such a force seemed like a way of bringing back discredited occultist ideas of magical forces rather than being based on a mechanical approach to nature like Cartesianism.

Newton saw his science and numerous other intellectual exertions as efforts to understand the mind of God and to comprehend ultimate truth. God was the lawgiver of Newton's law-governed universe. Newton was more religious in his approach to natural philosophy than his seventeenth-century predecessors Galileo Galilei or even Descartes, claiming in a letter of the *Principia*, “When I wrote my treatise about our system, I had an eye on such principles as might work with considering men, for the belief of a Deity; and nothing can rejoice me more than to find it useful for that purpose.”

Nathaniel Bowditch (1773–1838) was a largely self-educated Massachusetts clerk and sailor who became one of the leading Newtonians of the new United States. Growing up in the seafaring community of Salem, Bowditch

THE MARQUISE DU CHATELET AND EIGHTEENTH-CENTURY FRENCH NEWTONIANISM

The French noblewoman Emilie du Chatelet was one of the few women to participate in mid-eighteenth-century Newtonian physics. In 1733, she met the Enlightenment philosopher Voltaire, then campaigning for Newtonianism in France. The two began a love affair that was also an intellectual partnership. Du Chatelet's mathematical skills far exceeded Voltaire's, making her assistance vital as he wrote his Newtonian textbook, *Elements of the Philosophy of Newton* (1738). Du Chatelet's first published work, the anonymously published *Institutes of Physics* (1740), combined Newtonian ideas with those of Newton's great rival Gottfried Wilhelm Leibniz. The text's anonymity, considered appropriate for the work of a woman, enabled her enemies to spread the rumor that she had not written it herself. Her other significant work was the French translation of Newton's *Mathematical Principles of Natural Philosophy*, which drew on a number of editions, commentaries, and popularizations of Newton as well as the Latin text itself. More than a translation, it included a commentary incorporating work done on mathematical physics since Newton's time. Du Chatelet's translation was completed in 1749, shortly before her death in childbirth, but was not published until 1759. It remains the only French translation of Newton's masterpiece.

—William E. Burns

The Marquise du Châtelet was one of the brilliant women of the Enlightenment, a noted mathematician, physicist, and feminist, as well as the long-term mistress of the French philosophe Voltaire. (Bettmann/Corbis)

from a young age became renowned for his mathematical skills. He taught himself calculus and Latin to understand the *Principia* and also learned French, the most important language of international science at the time. He also had practical experience, sailing on five commercial voyages to the East Indies and Europe, on the last of the five as commander. His *Practical Navigator* began as a revision of the English writer John Hamilton Moore's guide to navigation, *The Practical Navigator*. Bowditch worked together with his brother William and produced the first American edition of the work in 1799. The third edition of Bowditch's revision appeared in 1802 as *The New American Practical Navigator*, and it was in its tenth edition as a standard manual of navigation and seamanship by the time of Bowditch's death.

Bowditch's improvements on Moore included the correction of some errors and a new and simpler way of computing the longitude by the method of lunar distances, one more usable by sailors rather than astronomers. The excellence of Bowditch's work was recognized quickly. In 1799 he was elected to one of America's leading learned societies, the Academy of Arts and Sciences. *The New American Practical Navigator*, or *Bowditch* as it is familiarly known, remains after many ongoing revisions a foremost authority on navigation. In 1868 the copyright was purchased by the U.S. Navy Hydrographic Office, and it continues to be published by the Department of Defense. Bowditch himself continued to publish in astronomy and mathematics while maintaining an active career as a businessman. His best-known work after

The New American Practical Navigator was his translation of the first four volumes of the French Newtonian physicist and mathematician Pierre-Simon Laplace's five-volume *Celestial Mechanics* (1829–1839).

Mechanistic Philosophy

Seventeenth-century Europe saw the rise of “mechanical philosophy” as a way to understand nature. Mechanical philosophers viewed matter and motion as sufficient to explain all natural occurrences. For strict mechanical philosophers, matter itself was “dead,” or inert, acting only as motion was impressed upon it. Bits of matter interacted only by direct contact or impact; “action at a distance” was impossible. Mechanical philosophy was distinct from traditional Aristotelianism, which saw matter as seeking its “natural place,” and magic, which relied on attractive and repulsive forces acting at a distance.

Mechanical philosophy originated as a way of doing physics compatible with Copernican heliocentric astronomy. Aristotelian physics, the dominant school before the seventeenth century, depended on a geocentric cosmos, while mechanical philosophers were Copernicans. The most influential mechanical philosophers of the first half of the seventeenth century were two closeted Copernican Catholic Frenchmen, René Descartes (1596–1650) and Pierre Gassendi (1592–1655). Their mechanical philosophies were quite different. Descartes emphasized his own originality rather than claiming to revive a classical tradition. He saw the universe as a plenum, full of different kinds of matter with no empty space, or “void.” For Descartes, matter was infinitely divisible. His mechanical philosophy was most systematically set out in his 1644 Latin textbook *Principles of Philosophy*.

Gassendi was a humanist who claimed to be reviving the atomism of the ancient Greek philosopher Epicurus. Like the Epicureans, Gassendi saw the the universe as composed of atoms—the smallest bits of matter, not capable of being divided—circulating in a void. Gassendi's Christianity led him to reject some Epicurean ideas, such as the eternity of atoms and their infinite number, but he devoted enormous effort to demonstrating the compatibility of atomism and Christianity. Gassendism, mostly expressed in difficult Latin tomes rather than the elegant French of Descartes's popular works, never rivaled Cartesianism in France but had a great influence in England.

Arguments between the two sects of mechanical philosophers often turned around the existence of the void, which was fundamental to atomism but which Cartesians, like Aristotelians, denied. The invention and dissemination of air pumps, instruments for producing a crude vacuum by pumping the air out of a vessel, supported atomism by demonstrating a void. By the end of the seventeenth century, versions of Cartesianism that accepted the void were circulating.

Although many natural phenomena could be explained by mechanical interaction, some presented difficult problems. Magnetism was a classic example of action at a distance, so mechanical philosophers had to find mechanical explanations. Descartes came up with a complicated explanation based on a “subtle” matter of corkscrew-shaped particles, not immediately apparent to the senses. Gassendi and other atomists also explained magnetism and other physical phenomena by the interactions of particles of various shapes or with special properties. Another tough explanatory challenge was life. Descartes believed that the human body was a mechanical automaton informed by a nonmaterial soul and speculated that the link between soul and body was located in the pineal gland. Animals, lacking souls, could be treated purely as machines. This mechanistic biology was taken further by the iatromechnists, or mechanical physicians, of the late seventeenth century, including the Neapolitan atomist Giovanni Alfonso Borelli (1608–1679). Through the Leiden medical professor Herman Boerhaave (1668–1738), mechanistic thought shaped the medicine of the Enlightenment.

▶ ROBERT BOYLE ON MECHANICAL PHILOSOPHY AND RELIGION

Robert Boyle was a devout Protestant and a mechanical philosopher. The following passage from *The Excellence and Grounds of the Mechanical Philosophy*, first published in 1674, attempts to find a religiously safe way to endorse a mechanistic approach to the cosmos.

“By embracing the corpuscular, or mechanical philosophy, I am far from supposing, with the Epicureans, that, atoms accidentally meeting in an infinite vacuum, were able, of themselves, to produce a world, and all its phenomena: nor do I suppose, when God had put into the whole mass of matter, an invariable quantity of motion, he needed do no more to make the universe; the material parts being able, by their own unguided motions, to throw themselves into a regular system. The philosophy I plead for, reaches but to things purely corporeal, and distinguishing between the first origin of things, and the subsequent course of nature, teaches, that God, indeed, gave motion to matter; but that, in the beginning, he so guided the various motion of the parts of it, as to contrive them into the world he design’d they should compose, and establish’d those rules of motion, and that order amongst things corporeal, which we call the laws of nature. Thus, the universe being once fram’d by God, and the laws of motion settled, and all upheld by his perpetual concurrence, and general providence; the same philosophy teaches, that the phenomena of the world, are physically produced by the mechanical properties of the parts of matter, and, that they operate upon one another according to mechanical laws.”

—William E. Burns

Source

Roger Ariew and Eric Watkins, *Modern Philosophy: An Anthology of Modern Sources* (Indianapolis: Hackett Publishing, 1998), 262.

Mechanical philosophy had a complicated relationship to religion. The alliance between Christian theology and Aristotelianism was longstanding and nearly as influential in Protestant as in Catholic Europe. The association of atomism with Epicurus, reviled as an atheist, was

also a problem. A disciple and correspondent of Descartes and Gassendi, Marin Mersenne (1588–1648), developed the mechanical philosophy in a religious direction. Mersenne, a priest from a particularly ascetic order of Franciscan friars, the Minims, saw the magical tradition, and particularly the “vitalist” belief that nature is somehow alive, as the root of all heresy. Unlike other mechanical philosophers, he did not see Aristotelianism as the main enemy. Mersenne claimed that nature was not alive and that it acted mechanically except when God or other supernatural entities, such as devils or the souls of humans, acted directly on it. Mechanical philosophy enabled a clear distinction between nature in its ordinary course and miraculous actions, which made possible a definition of miracles as those events that were not mechanically determined.

For both Catholics and Protestants, however, the mechanical philosophy had dangerous associations with materialism and determinism. Many intellectuals viewed mechanical philosophy as useful in combating superstition but feared that a consistent mechanist materialism could be seen as disputing divine action in the world, leading to “atheism,” defined less as lack of belief in God than as lack of belief in divine activity. Descartes himself got into trouble in the Dutch Republic with conservative Calvinist university authorities because of this. (Despite this initial bad start, the Dutch universities were the first to adopt Cartesianism.) The philosophy of Dutch Jew Baruch Spinoza (1632–1677), combining strict mechanical determinism with a God immanent in nature rather than transcendentally outside it, was even more radical and frightening. Catholics also had problems explaining the doctrine of transubstantiation, the transformation of the bread and wine of the Mass into the flesh and blood of Christ, in mechanical terms. These religious issues got Descartes’ works put on the Church’s Index of Forbidden Books in 1663.

Mechanical philosophy in both Cartesian and Gassendist forms was introduced to England in the 1650s. The English sometimes combined ideas from the Cartesian and atomist traditions or even combined mechanical philosophy with concepts taken from other traditions such as Aristotelianism or alchemy. Strict mechanical philosophy, with its insistence on mechanical

and only mechanical explanations, was not congenial to antidogmatic English scientists, in addition to being religiously problematic. English mechanical philosophers were willing to consider the possibility of an active noninert matter as long as it acted mechanically. Anglo-Irish chemist Robert Boyle (1627–1691), the leading British chemist and the inventor of the term “mechanical philosophy,” combined mechanical and alchemical ideas. Physicist Isaac Newton (1642–1727) combined mechanical explanations with universal gravitation, which many mechanical philosophers, particularly the Cartesians dominant on the European continent, saw as an intellectually illegitimate revival of occult and magical forces.

The Beginnings of the Scientific Method—Francis Bacon and René Descartes

In the seventeenth century the new science became an increasingly self-conscious activity, accompanied by the rise of the methodological reflections. Although modern philosophers and historians of science reject the idea of a single scientific method, many of the methods used by modern scientists rest on seventeenth-century foundations.

The most conscious attention to scientific method was paid by English statesman and philosopher Francis Bacon (1561–1626). Bacon's most influential published work of natural philosophy was *The Advancement of Learning* (1605), published in an expanded Latin edition as *De Dignitate et Augmentis Scientiarum* (1623). In it and his other works such as *The New Organon* (1620), Bacon proposed to

replace Aristotelian deductive logic, working from general principles to individual cases via the syllogism, with a new form of inductive logic, reasoning from particular instances to general statements. The compilation of empirical data from numerous observations was central to Bacon's method. Since more people could make more observations, an important part of Bacon's vision was collaboration between scientists. His utopia, *The New Atlantis* (1627), described a fictional cooperative scientific institute called Solomon's House. Solomon's House, where investigators gathered information and philosophers analyzed it, was occupied by a hierarchy of natural philosophers and investigators. It was closely allied with the state, which was a central element in Bacon's vision. Bacon was suspicious of natural philosophy carried out by independent investigators with no connection to the political and social hierarchy.

Bacon also believed that the ultimate goal of science was practical use. He viewed technological change, particularly the printing press, the magnetic compass, and gunpowder as marks of the modern era and hoped that organized scientific enquiry would further expand human powers.

The great weakness of the Baconian method was the difficulty of getting from facts to theories and applications. William Harvey, the discoverer of the circulation of the blood, was Bacon's physician but derided his system as devoid of practical use. Baconian science in practice could degenerate to mere fact gathering, as in Bacon's own *Sylva Sylvarum; Or, a Naturall Historie* (1627). Bacon was also suspicious of mathematics, possibly due to its connection with magic.

Although Bacon hoped that King James VI and I, the dedicatee of *The Advancement of Learning*, would put Baconian policies into action, state-sponsored Baconianism had to wait for the Puritan regimes of the 1650s following the English Civil War. There were many reasons why Puritans found Baconian ideology attractive. Many, although not all, Puritan intellectuals shared Bacon's anti-Aristotelianism due to their hatred of medieval Catholic Scholastic theology. More importantly, Bacon's emphasis on renewal and progress fitted with the millenarian and reforming tendencies of Puritanism. The period

➤ A BACONIAN VENTURE—THE CONFERENCES OF THEOPHRASTE RENAUDOT

Many of Bacon's works were in Latin, as he expected them to influence intellectuals in continental Europe, few of whom read English. One continental Baconian was the French physician Theophraste Renaudot (1584–1653). Inspired by the Baconian ideal of collective inquiry, Renaudot held conferences with about 100 participants at a warehouse every Monday afternoon from August 22, 1633, to September 1, 1642. These conferences were open and included both nobles and bourgeois, among them many physicians who worked at Renaudot's clinic. Each conference was devoted to a particular topic. Religion and politics were barred, and many conferences were devoted to medical or natural-philosophical topics ranging from the existence of unicorns to Paracelsianism to recent innovations such as the motion of the earth or Galileo's theories of sunspots. Conference speakers argued from a wide variety of intellectual positions, from Aristotelian to Paracelsian, although many were not exclusively committed to a particular school. Renaudot published both weekly proceedings and massive collections of 100 conferences. These went through many editions and repackagings, including a two-volume English translation published in 1664 and 1665.

—William E. Burns

saw efforts at Baconian fact gathering, technological research, and Bacon-inspired reforms of education.

The Baconian ideal of fact gathering and collaboration, however, was not discredited after the overthrow of the Puritans and the Restoration of Charles II in 1660 and eventually inspired the foundation of permanent academies of science such as England's Royal Society. (The Royal Society also benefited from Bacon's Englishness, which helped them put their work in a patriotic light.) Although scientists, particularly in England, frequently harkened back to Bacon, late-seventeenth-century Baconianism also drew from other sources, such as the experimentalism of magnetism investigator William Gilbert or the empiricism of French atomist Pierre Gassendi. Characteristics of the full-fledged Baconian

philosophy included a continued emphasis on cooperation between natural investigators as well as on empiricism, experimentalism, opposition to the ancients and particularly Aristotle, resistance to theorizing, and belief in the possibility of improvement of human powers through the progress of science and technology. Since it emphasized method rather than a particular set of natural-philosophical theories, Cartesians, atomists, alchemists, and even Aristotelians could work together under the Baconian aegis of cooperation, natural philosophy, and progress. The experimentalist Robert Hooke attempted to systematize Baconian logic into a "Philosophical Algebra" that would generate scientific conclusions from empirical data.

A contrast to Bacon in method was French mathematician and philosopher René Descartes (1596–1650). Equally anti-Aristotelian, Descartes emphasized deduction from first principles rather than Bacon's fact gathering. Descartes did not reject empirical work. He performed experiments and made investigations, but his science remained theoretical. Descartes's ultimate ambition seems to have been to replace Aristotle as the dominant philosopher in the schools and intellectual life generally, and to do so he presented his core ideas and theories as metaphysically certain. Descartes also presented his science as a unity in which different branches of science were ultimately unified by the same principles. For Descartes, these were mechanical principles: the reduction of the universe to matter and motion. Cartesianism was one of several schools of mechanical philosophy in the seventeenth century. While Bacon was open to different types of scientific explanation, Descartes and Cartesians believed that for an explanation to be valid, it must be capable of being expressed in mechanical terms. Descartes also differed from Bacon in having much less interest in practical use. One similarity between the two was a lack of interest in mathematizing science. Despite Descartes's own mathematical skills, Cartesian science remained quantitative rather than qualitative.

In the 50 years after Descartes's death in 1650, Cartesianism became the predominant school of natural philosophy in France and most of Europe. Cartesianism had several advantages

over its principal competitors in France, the Aristotelianism of the universities and the rival atomistic mechanical philosophy of Gassendi. A small band of dedicated Cartesians in the 1650s and 1660s edited and published Descartes's letters and unpublished works, organized conferences, and finally orchestrated the dramatic return of Descartes's body from where he had died in Sweden to be buried in Paris in 1667. Methodologically, Cartesians continued to view experiment as secondary to logical deduction as a mode of scientific enquiry. However, Cartesians increasingly deviated from Descartes by abandoning his belief in certain knowledge and making ingenious explanations for natural phenomena with the goal of plausibility and even entertainment value rather than certainty. Cartesians following Descartes also made increased use of mathematics, particularly in response to Isaac Newton's anti-Cartesian *Mathematical Principles of Natural Philosophy* (1687).

Kaozheng

During the seventeenth and eighteenth centuries, Chinese intellectuals developed the practice of kaozheng, or evidence-based research, often associated with Han education. Some scholars of the Qing dynasty (1644–1912) looked back toward the Han dynasty (202 BCE–220 CE) as a time of pure Confucianism and tried to reinstitute the scholarly methodology of that age. These scholars constituted the Kaozheng, or Han-Learning, school. They believed that Neo-Confucianism, incorporating the Buddhist and Daoist influences of the Song dynasty (960–1276), had

polluted Confucianism by focusing on individuality rather than the necessity of a unified society. These Kaozheng scholars, supported by the Qing emperors, blamed Neo-Confucianism for the fall of the Ming dynasty and began meticulously analyzing Confucian texts.

Chinese scholars under the reign of Qing emperor Kangxi provided the foundation for kaozheng scholarship. One of the most important examples was Gu Yanwu, a member of the Han learning school. Gu traveled throughout northern China studying technology and making careful copies of Han era documents. During these travels he took detailed notes on texts, artifacts, and the geography. Gu's approach broke with Song and Ming approaches to scholarship. Intellectuals

➤ COPERNICUS IN CHINA—JESUIT TEACHINGS

Although the Jesuits introduced Western astronomy to China, they did not teach the Copernican system, since teaching it as a description of physical reality was banned by the Roman Catholic Church. Instead, Jesuits in China as in Europe supported first the Ptolemaic system, with the earth at the center of the planets' orbits, and then beginning in the 1630s shifted to Tycho Brahe's system, which depicted the sun and moon as orbiting the earth and the planets as orbiting the sun. Although the Chinese had no access to European writings defending Copernicanism in the seventeenth century, Copernican astronomy reached China indirectly. Jesuit writing in Chinese on cosmological theory discussed the Copernican system in general terms in order to refute it. Jesuits revealed to the Chinese the telescopic discoveries of Galileo Galilei, which Galileo himself and other contemporary astronomers viewed as evidence for Copernicanism, and used astronomical tables, some of which were based on Copernican assumptions. The news of Galileo's discoveries quickly reached China; by 1615 Father Emmanuel Diaz had included descriptions of Jupiter's satellites and the phases of Venus in his Chinese book, *Problems of Astronomy*. The first person to advocate in Chinese the heliocentric system as clearly superior for astronomical calculation was the Jesuit astronomer Michel Benoist (1715–1774).

—William E. Burns

➤ XIANGYUE (COMMUNITY COMPACT)

One of the reconfigurations of Confucianism by the Song dynasty scholar Zhu Xi (1130–1200) was the idea of *xiangyue*, or Community Compact. Zhu Xi's idea built on the example set by the Lü family in 1077. The Lü's monthly meetings entailed elections, food, and detailed behavioral regulation. Like the Lü family's example, Zhu's community meetings were designed to teach Chinese elites appropriate hierarchical behavior. In this effort, he established five age grades with specific rules of conduct for each group. Seniority seating, greetings, clothing, and invitations were among Zhu's detailed protocols. Discussions held during these meetings praised good deeds and corrected errors. The ultimate goal of the Community Compact was to connect the Chinese elite family to the state, creating a fusion of private and public interests. This Neo-Confucian idea was not regularly practiced until the Ming dynasty. The goals and procedures of Community Compacts were revitalized by the Chinese Communist Party in the twentieth century. As John Fairbank and Merle Goldman note, "the content would differ but the methods of criticism and self-criticism would resurface under the People's Republic." In each instance, the goal was an applied community morality.

—Kassi Klinefelter

during those periods focused on morality and metaphysics, and thus their work was less specific and more philosophical and neglected archival research. Influenced by Gu's work and possibly European sciences, kaozheng scholars attempted to reconstruct the original meaning and authenticity of the Confucian classics through philology, astronomy, and textual analysis.

The Yangzi Delta was the home of mid-Qing kaozheng scholarship. Successful evidence-based research required large archives and money to finance the work. In response to this need, libraries were created in the Yangzi region. This region benefited financially from China's consolidated trade with foreigners, which by the 1600s included the Dutch, British, Portuguese, and Spanish. Merchants often used their wealth to finance kaozheng scholars and documentary collections. Additionally, in this area semiautonomous

kaozheng academies developed in the late eighteenth century; the three main centers were in Yangzhou, Zhenjiang, and Hangzhou. For many, kaozheng broke the traditional scholar-official bond by establishing research as a full-time profession. However, the independent nature of the research blocked poorer self-educated scholars and women from kaozheng scholarship. Kaozheng was commemorated in 1829 by Ruan Yuan, the emperor's top official in the Guangdong province (where European trade was conducted). His collection of 180 kaozheng works illustrates the connection between the evidential research movement and the merchant community.

Increased knowledge and interest in the social and physical sciences resulted from this evidence-based scholarship. Kaozheng researchers' attempts to seek truth from the facts required systematic patterns of study and large collections of data. Consequently, detailed examinations of the past provided insights into hydraulics, astronomy, government, and cartography. Additionally, modern Chinese archaeology developed from this movement. In the 1890s when researchers were analyzing oracle bones from the Shang dynasty, the kaozheng interdisciplinary approach provided them with the knowledge to recognize their importance.

Kaozheng was the driving force for the intellectual development, although sometimes he was most notable for inspiring resistance. The Qing dynasty was a period of intellectual diversity. Following the pattern of the Ming dynasty, Qing rulers supported the Zhu Xi interpretation of Confucianism. These Neo-Confucian ideas—loyalty to emperor, moral self-cultivation through study, and positive role models—were known as the School of Song Learning, or the School of Principle. During the Qing dynasty, the government encouraged the spread of Zhu Xi's ideas by incorporating them into the official examination syllabus. The Tongcheng School, centered in Anhui, also embraced Zhu Xi's idealistic view of Confucianism. However, Tongcheng scholars broke with their Song contemporaries by embracing literature as the means to understand Confucian moral philosophy. The Tongcheng and Song schools had a shared hostility toward kaozheng. They objected

to its reliance on empiricism and undermining of the Confucian classics.

Han learning and kaozheng scholarship were intellectual movements that challenged China's Confucian system. During the seventeenth century, for instance, Yan Rouju's analysis proved that the old-text version of the Book of Documents that was used in the imperial exams was, in fact, a forgery. Utilizing his method of close textual analysis, mid-Qing scholars demonstrated that during the Han dynasty phony documents were inserted into the Confucian classics. This discovery along with the Han learning rejection of Song thought due to its corruption by Buddhist and Daoist ideas cast doubt on the authenticity of other sacred Confucian texts and scholarly objectivity. Unlike the humanist scholarship of the Renaissance, however, the subversive potential of these challenges to the status quo was never developed by Han or kaozheng scholars. Instead, scholars of the Qing era achieved an intellectual compromise. Song Confucianism was utilized for moral questions, while Han and kaozheng scholarship dominated textual research.

Innovations in Navigation

The eighteenth century witnessed the perfection of innovations in navigation that made long-distance voyages across the open seas safer and more accurate. Thanks to these innovations, exploration and trade were possible and economical. They made the world a different place.

During the late Middle Ages, seafarers rarely sailed far from locations they knew. Navigation was done through observing the positions of stars and landmarks on nearby shores. Portolan books were also available to navigators in the

Mediterranean by the end of the thirteenth century. The manuscripts gave sailing directions along the coasts, including landmarks, distances, and warnings about hazards, although these books did not seem to be widespread, as the first one did not appear in England until 1489.

In other parts of the world such as the Pacific, navigators became skilled at finding their way through observation and memorization. Polynesian sailors learned to note the points at which certain stars rose and to sail courses in relation to those points. They also memorized current patterns and watched for clouds and birds that indicated the presence of land.

By the fifteenth century, however, ships were sailing far out of sight of land. Europeans were attracted by the rewards of trade with Asia, and countries like Portugal were sending expeditions farther and farther to locate a sea route. Navigators developed the skills to determine how far north or south they were of the equator (i.e., latitude). The most common way was to use an astrolabe to find the sun's altitude at noon. Tables with the sun's position on different days were gradually compiled to show how far from the equator a ship would be. Columbus used a declination table on his voyage.

By the seventeenth century, the most pressing problem for navigators was to find out their position to the east or west. Different methods were proposed. Most methods involved observing a celestial body and comparing the time to the time at an agreed-upon place. In England, Greenwich was chosen as the base location, as it was the site of the Royal Observatory since 1675. Different phenomena were suggested for observation, including the moons of Jupiter, Earth's moon, and the sun's midday position. An important first step before these methods could be used was the need for detailed tables of the celestial bodies' positions on different days. By the end of the eighteenth century, accurate tables had been produced and were widely distributed.

To encourage scientists and inventors to develop improved navigation systems, European governments offered prizes. In Spain in 1598, Philip III offered a 6,000 ducat prize plus an annual income of 2,000 more ducats for life to anyone who could discover longitude. Galileo was

► DEVELOPMENT OF THE PRAHU

The *prahu* (also seen as *proa* or *prau*) was the traditional sailing craft of the people of Malaya and Polynesia. It consisted primarily of a main hull and a second much smaller hull or outrigger. A crab-claw sail, so-named because of its curved shape, was used. The prahu is unique among sailing vessels because the vessel does not turn like other vessels but simply changes directions. The front becomes the rear and vice versa. The sail could be easily managed by a small crew. Prahus came in many sizes, ranging from small canoes to larger vessels that included cabins and considerable carrying capacity. The prahu was used by Malayan traders to carry goods to the ports controlled by the Europeans in Southeast Asia for shipment to Europe during the eighteenth and nineteenth centuries. It was also the basic vessel used by the Polynesians to migrate and settle the scattered islands of the Pacific. Even though it was built with Stone Age technology, the prahu remains one of the fastest sailing vessels, thanks to its small hull area and efficient sail. The prahu was an especially effective technology for the Pacific Ocean and the South Seas, thanks to its seagoing capabilities and the Polynesians' abilities to navigate over long distances without printed charts or sophisticated instruments.

—Timothy J. Watts

among those who offered suggestions. In 1636 Holland offered a similar prize. The French government of Louis XIV encouraged research and financial support to researchers. In 1714 Parliament offered a reward of 20,000 pounds to the person who developed an effective way of discovering longitude. Thousands of people made suggestions to these governments hoping to win the prize.

An important part of many of the methods proposed was a timepiece that could be used on board ships. Early experiments with clocks

showed their workings were upset by the motion of the ship, along with the wetness and changing temperature. It was not until 1735 that John Harrison built the first practical clock, using a pendulum of alternating iron and brass bars that was not as sensitive to temperature. Over the next 30 years Harrison built four more clocks that met the requirements set out by Parliament, but he only received his money after a petition to George III.

The method that Harrison proposed to determine longitude, which was finally successful, was for a ship's navigator to note when the sun reached its zenith. This observation would indicate the local midday. The clock on board was kept at Greenwich time, and difference between that time and the local time was calculated. For each hour difference between the two times, the ship was approximately 15 degrees east or west of Greenwich.

The proof that navigation had improved during the eighteenth century was the success of Captain James Cook and his voyages. Cook successfully used *The Nautical Almanac*, produced by Nevil Maskelyne for the years 1767–1769 with tables of lunar positions, on his voyage to the Pacific in 1769. Cook's well-publicized voyage proved to any doubters that sailors could now navigate across the world with accuracy.

■ Introduction: Expanding Knowledge of the World—Knowledge Transfers

Scientific and technical knowledge was transferred through many avenues during the early modern era. Some transfers took the traditional form of written texts, which in Europe and its cultural sphere were radically transformed through Guttenberg's invention of printing during the 1450s and the subsequent spread of printing presses throughout the Western world. Printing not only enabled the creation of hundreds or thousands of copies of a given text but also ensured that each copy was close to identical, minimizing the errors and confusions that second, third, and subsequent generations of copies introduced into manuscripts. Innovations in language also facilitated knowledge transfer in Europe and other civilizations. Scholarly languages such as Latin in Europe, Arabic in the Islamic world, and Classical Chinese in East Asia long had been vehicles for communication among intellectuals, scientists, and artists. By the mid-eighteenth century the use of Latin was declining in Europe, with French taking its place in many areas. And with increasing levels of literacy, vernacular languages that fostered greater communication between people who spoke different everyday languages played a greater role in Europe. An active culture of scientific popularization through lectures, magazines, and books was one result of this transformation in the ways in which knowledge came to be transferred.

Although printing had been practiced in East Asia since the seventh century, it was not adopted in India, the Islamic world, or other societies during this period. Knowledge continued to be circulated via manuscripts as well. European missionaries in China, India, and elsewhere like the Jesuit Matteo Ricci spread European science in the languages of the people they lived among. Their real purpose was using science and technology to open the door for religious conversion, but their scientific offerings were often more prized than their religion. Missionaries, explorers, and conquerors like Hernando Cortez also collected natural history, medical, and anthropological information from the newly encountered

territories. This knowledge often made its way into print.

Knowledge was also transferred orally and through everyday practices. The global spread of crops following the European encounter with America, for example, meant that the knowledge of how to grow and prepare foods also spread. Europeans avidly learned from Native Americans the uses of corn, tobacco, potatoes, and numerous other crops. As American crops spread across the Old World to Africa, India, China, and elsewhere, broader cultural knowledge spread with them. Cultural complexes of food knowledge spread in other directions as well. Enslaved West Africans in South Carolina brought the knowledge of rice cultivation and preparation to America, benefiting not themselves but their masters.

Knowledge transfer was not, however, a generally accepted practice during the early modern period. Governments, corporations, and religious orders were among those that treated certain kinds of information as proprietary. The Spanish and Portuguese governments in particular kept their navigational and cartographical knowledge as secret as they could to prevent competition from other European powers. The Catholic Church established an Index of Forbidden Books that banned the publication of many works of science, most notoriously Copernicus's *On the Revolutions of the Celestial Spheres*. Islamic religious authorities prevented the spread of printing and especially images throughout the Islamic world. Japan's Tokugawa government suppressed much European scientific writing in Chinese for fear of its contamination by the forbidden religion of Christianity while encouraging the spread of traditional Chinese science and scholarship to support the established order.

On European Time in Asia—Jesuit Reform of the Chinese Calendar, 1640s

Following the conquest of China by the Manchu Qing dynasty in 1644, Western methods of

➤ FERNAND VERBEIST AND THE KANGXI EMPEROR

The most important Jesuit scientist in the China mission after Schall von Bell was the Fleming Fernand Verbeist (1623–1688), who entered China in 1659. Verbeist bore some of the brunt of the reaction from traditional Chinese scholars who saw the Jesuits as rivals in the early Qing dynasty. He fought back in the traditional manner of Jesuits in China by demonstrating the superiority of his astronomical methods over those practiced by traditional Chinese and Islamic astronomers. After defeating his rivals in a contest of predicting the precise position of the sun at a given time, Verbeist was appointed head of the astronomical bureau in 1669. Unlike previous Jesuits in China, he actually succeeded in building a close and long-lasting personal relationship with an emperor. A skilled politician, Verbeist accompanied the young and intensely curious Kangxi emperor on his travels. Verbeist built mechanical devices for the emperor and tutored him in Western technology and science, although his Jesuit rivals in Beijing suggested that he exaggerated his familiarity with the ruler. After Verbeist's death from being thrown by a horse, he received a magnificent state funeral at the emperor's command. However, Verbeist failed in his ultimate objective of converting the Kangxi emperor to Christianity.

Jesuit priest and astronomer Fernand Verbeist, in Chinese dress. (Giraudon/Art Resource, NY)

astronomical calculation, as practiced and taught by European Jesuit missionaries, received the official endorsement of the Chinese state. The techniques were applied to one of the imperial government's core tasks, the creation of a calendar. Chinese calendars included predictions of the time and duration of eclipses and other celestial phenomena, and the prestige of the government was endangered by inaccurate predictions.

Astronomer Johann Adam Schall von Bell, the leader of the Jesuit mission in Beijing, had spent many years after his arrival in Beijing in 1623 building his influence in the court of the Ming ruler by carrying out technical functions, including the casting of cannon and the inspection of fortresses. Like other Jesuits in China, Schall von Bell hoped that by demonstrating their usefulness to the imperial government

the Jesuits would ultimately lead to converting the emperor and the empire to Roman Catholic Christianity. The conquest of China by the Manchus at first seemed a crippling blow to Schall von Bell and the Jesuits' ambitions. In addition to the physical destruction wrought by the war, the credit that the Jesuits had built up with the leaders and courtiers of the Ming government was now entirely useless. Schall von Bell even considered abandoning the astronomical mission in favor of an exclusively religious approach but relented when a fire spared the building where he kept his mathematical books. He interpreted this as a divine sign that his mathematical work was pleasing to God. Schall von Bell's hopes were vindicated when the Qing assumed the authority of a Chinese dynasty and inherited responsibility for the calendar.

Schall von Bell sent a petition that predicted the time and duration of a forthcoming solar eclipse to the new Chinese emperor with a request that the Board of Rites test the prediction. The day of the eclipse, September 1, saw Schall von Bell's calculations publicly verified in the presence of officials of the Astronomical Bureau. He was offered the position of director of the bureau, setting a precedent that would be followed by Western Jesuits until news of the suppression of the order reached China in 1774. As head, Schall quickly replaced astronomers trained in Islamic and traditional Chinese methods with experts in Western astronomy.

The Chinese calendar combined lunar and solar reckoning, and like all such calendars it required frequent readjustment. Schall von Bell's appointment was the culmination of a long process whereby both Western methods and Christian personnel, Jesuits and Chinese converts, had infiltrated the astronomical bureaucracy. This influence was not lost with the Qing conquest, as there was considerable institutional continuity between the Ming and Qing dynasties. Despite their rejection of Copernican astronomy, the Jesuits and their Chinese pupils possessed many advantages over the traditional Chinese methods that had previously dominated calendar making. Western benefits included a more accurate cosmology based on a spherical Earth, while traditional Chinese thinking identified the Earth as flat. The Jesuits also possessed superior astronomical instruments and more accurate tables, including the famous Rudolfine tables of Johannes Kepler.

Propagatio Fidei per Scientia—Matteo Ricci and Chinese Astronomy

Matteo Ricci (1552-1610) was an Italian Jesuit missionary largely responsible for the introduction of Western astronomy in China. He arrived in China in 1582 and lived there until his death. After failing to attract sufficient interest in Christianity among ordinary Chinese while dressing like a Buddhist monk, Ricci decided to follow a top-down conversion strategy focused on the Confucian literati and the imperial government. This was the strategy of *Propagatio Fidei per Scientia*, spreading faith through knowledge. Rather than immediately seeking converts, he hoped that impressing China's elite with the power and usefulness of Western science and technology would lead to the acceptance of Western religion. Taking the costume of a Confucian sage, Ricci learned to imitate the polished literary Chinese of the literati and even translated the Chinese Four Books, Confucian classics, into Latin.

Astronomy, which Ricci viewed as a branch of mathematics, was particularly important to this strategy. He saw that the Chinese government valued celestial knowledge, relying on accurate calendars and predictions of eclipses to demonstrate the ruler's possession of the mandate of heaven. The official calendar was also relied on throughout East Asia for its designation of fortunate and unfortunate days. But the Chinese calendar combined lunar and solar reckoning and, like all such calendars, needed frequent adjustment. Ricci recognized that the study of the cosmos, unlike natural philosophy and medicine, was an area in which Western science was clearly superior to the Chinese. This superiority could be objectively measured by comparing the accuracy by which Western and Chinese astronomers predicted celestial events such as eclipses. Part of the reason that Ricci was allowed to reside in Beijing permanently after 1601 was that the government hoped he could help with the calendar. (Other areas of Western superiority exploited by Ricci and later missionaries were geography, cartography, and clock making.)

Ricci had studied at the Collegio Romano, the Jesuit college in Rome, under the greatest

➤ JOHANN ADAM SCHALL VON BELL,
YUANJING SHUO (ON THE TELESCOPE), 1626

Johann Adam Schall von Bell was the most important of the group of Jesuit astronomers who arrived in Macao, then a Portuguese-controlled city in China, on July 15, 1619. Of German descent, he eventually became the leader of the Jesuit mission in China and the head of the Chinese astronomical bureau. He began to make a reputation for himself after his arrival with successful predictions of the time and duration of eclipses. Schall von Bell's *Yuanjing Shuo* was the first extensive discussion of the telescope to appear in Chinese. In addition to describing the instrument and its operation, he also recounted some of the recent telescopic discoveries of Galileo, including the moons of Jupiter and the phases of Venus. This was not the first description of these discoveries to appear in Chinese, but it was the fullest. Schall von Bell's praise of the telescope was not restricted to its astronomical uses. He also pointed out that it was very useful in war, giving a general a chance to inspect an enemy's army from a safe distance. The Jesuits presented a telescope to the Ming emperor in 1634.

—William E. Burns

Chinese of Euclid's *Elements* that the superiority of Western astronomy was in part due to the rigor with which Europeans, Italians in particular, examined natural phenomena. Although Ricci never reaped the harvest of conversions that he hoped, some Chinese were led to Christianity through their admiration for Western science. The path of involvement in Chinese astronomy that Ricci established was followed by Jesuit missionaries until the suppression of the order by the pope in 1773.

Self-Sounding Bells in Chinese Culture

The term “self-sounding bell” (*zimingzhong* in Chinese) refers to the elaborate Western-style mechanical clocks made either in Europe or China that were popular at the Chinese court in the seventeenth and eighteenth centuries. The first European clocks were brought to China sometime in the late sixteenth century and were introduced to the Ming (1368–1644) court when the Jesuit missionary Matteo Ricci (1552–1610) presented the Wanli emperor (r. 1573–1620) with two chiming clocks in 1601. The interest in Western timepieces continued into the Qing dynasty (1644–1911) when the Kangxi (r. 1662–1722) and Qianlong (r. 1736–1795) emperors collected them by the thousands. These clocks, as objects that combine Western mechanical technology with Chinese-European decorative styles, are a tangible result of the interactions between East and West that took place in the seventeenth and eighteenth centuries.

The history of Western mechanical clockwork in China is connected to the Jesuit presence at the court. Not only did the Jesuits supply the first clocks and watches from Europe, but they also introduced the theory and mechanics

Jesuit mathematician and astronomer, Christoph Clavius, with whom he retained a lifelong friendship and correspondence. (Clavius's gift of his new book on the astrolabe, which Ricci received in 1596, was particularly useful for making astronomical calculations.) Although Ricci had not received specialized astronomical training, he would have learned geometry, trigonometry, cosmological theory, and the use of basic astronomical instruments such as the astrolabe at the Collegio. In a letter sent in 1605 he implored his Jesuit superiors at Rome to send trained astronomers, but before they arrived (after Ricci's death) he was able to make do with his basic training and mathematical skills in predicting eclipses and adjusting sundials.

Although Ricci was aware of the Chinese skill in observational astronomy, he noted that their cosmological theory was weak and their mathematics comparatively crude. He proclaimed in the preface to his translation into

of clock making as well. Together with Chinese scholars, they coauthored or translated a number of treatises on mechanics, and when the emperor established a workshop devoted to clock making within the palace complex, the Jesuits worked alongside the Chinese clock makers in producing pieces for imperial use.

European science and technology, and in particular clockwork, were an important part of the Jesuits' proselytizing strategy of using science to secure a place for the mission. This strategy was aided by an already-present Chinese interest in science and by a curiosity in things from the West. Within this strategy, clocks were particularly useful: their unfamiliar technology made them especially appealing to the Chinese, unlike other Western objects such as painting that had an existing Chinese counterpart. Thus, the Jesuits were able to enter China and were allowed to reside in the capital. Eventually they were granted a special residence and a church in the Forbidden City.

Elaborate Western-style clockwork held a special place in the collecting interests of the Kangxi emperor and his grandson, who ruled as the Qianlong emperor. Made of expensive materials, these objects were an unusual combination of European aesthetics mixed with Chinese decorative motifs. They not only signaled the time with music and bells but did so with a number of accessory functions that included spinning jeweled flowers, waterfalls made of twirling glass rods, and mechanical figures that moved. Both the Kangxi and Qianlong emperors wrote poems in praise of "self-sounding bells," and the Kangxi emperor even made an effort to learn something about the theory and practical aspects of clock making.

As information on the imperial interest in elaborate clockwork became known, both Chinese and Europeans alike selected clocks as gifts or tribute to the court. The members of the Macartney embassy of 1792–1794, for example, made certain that English clocks and watches figured prominently among the gifts they were to present to the emperor. As the number of imported pieces could not satisfy this demand, a clock-making industry emerged in the cities of Guangzhou and Suzhou in the eighteenth century. These makers also helped to supply the needs of the urban elite who wanted to emulate imperial taste.

➤ JAMES COX'S FAMOUS CLOCKS

This elaborate gilt-bronze clock, made by James Cox of London in 1770 and once owned by the Qianlong emperor, is now in the collection of the Palace Museum in Beijing. Cox's work was in great demand at the Chinese court. This piece epitomizes the so-called self-sounding bells that so captivated the Chinese through features such as the jeweled flowers, the glass-rod waterfall, and the flying jeweled dragon, all of which spin or twirl to the accompaniment of music. Although Cox claimed to use Chinese elements in his work, this clock shows that these pieces were not based on Chinese aesthetics but instead represented the exotic East of the European imagination. This clock stands 34 inches (86 centimeters) in height.

—Catherine Pagani

(Palace Museum Beijing)

It is unknown exactly how many clocks were once in the great collection of the Qing emperors, but estimates put the number in the thousands. The collection was greatly diminished by the political upheaval in the nineteenth

century, when pieces were destroyed or carried off to Europe. Presently there are approximately 1,000 clocks from Qianlong's imperial collection in the Palace Museum in Beijing. They serve as reminders of the exchange of ideas in the arts and the sciences that occurred between two vastly different cultures in the seventeenth and eighteenth centuries.

Chinese Astronomical Clocks and European Mechanical Clocks

When the Jesuit missionaries presented European mechanical clocks to Chinese officials in the late sixteenth century, they assumed that the clocks' great popularity was owing to the technological sophistication of these devices, which was hitherto unknown to the Chinese. However, they had underestimated past native Chinese horology (as had, curiously, the Chinese themselves).

In China and Europe, both mechanical clocks and astronomical clocks incorporated sophisticated technologies. Both relied on a clockwork-like drive called an escapement to control the driving force by allowing the rotating wheel to move slowly, continuously, and with constant speed. Astronomical clocks added an aesthetic component, such as mechanized celestial globes and armillary spheres that represented the motions of celestial bodies. The Chinese had used a type of mechanical clock in connection with astronomy as early as the late seventh century. This technology culminated in a great water-powered astronomical clock of the eleventh century. However, while the Chinese had made great achievements early on, their skill did not progress beyond the developments of the thirteenth century, and eventually the technology

was lost. Clock making in Europe began during the late thirteenth century but was slower in developing the same sophistication as that in China. Then during the seventeenth century it underwent rapid technological advancement, resulting in greater reliability and the miniaturization of the mechanism.

The oldest known escapement used in the West is the verge and foliot. A horizontal bar with a weight on either end, called a foliot, oscillates and causes the verge, or vertical shaft, to set in motion a toothed wheel. This escapement, mentioned in an astronomical treatise of 1271, was weight-driven and not very accurate, as it depended on both the quality of the components and the overall cleanliness of the machine to perform reliably. The verge and foliot was such a fundamental technology that it was used exclusively until around 1670, when it was replaced by the anchor escapement.

Sometime during the first half of the fifteenth century a spring-driven escapement appeared as an alternative to weight-driven mechanisms. The main shortfall of this drive was that the coiled spring lost power as it unwound, and it lost this power unevenly. The addition of a fusee, a spindle wound with cord, helped to equalize the force. Although the spring drive lacked reliability, it did allow for clocks to be made portable; in 1512, Peter Henlein (1480–1542) of Nuremberg produced the first timepiece small enough that it could be carried in a pouch.

The two crucially important improvements to timekeeping took place during the seventeenth century: the pendulum and the balance-spring. The pendulum clock, invented by the Dutch astronomer and physicist Christiaan Huygens (1629–1695) in 1657 (although Galileo had remarked on the motion of the pendulum around 1582 and published his work in 1639), used a suspended weight as the force to control the escapement wheel and verge. The pendulum gave a constant rate to the escapement, a development that added precision and revolutionized timekeeping.

Following the introduction of the pendulum during the mid-seventeenth century came the flat spiral balance spring, one of clock making's most important developments. Balance springs enabled timepieces, particularly watches, to be made

► SU SONG'S CLOCK

The eleventh-century work *Xinyixiang fayao* (*New Designs of an Armillary Sphere and Celestial Globe*) by the astronomer Su Song (1020–1101) details the mechanism for a great mechanical clock tower constructed at the Song dynasty capital of Kaifeng in 1088. Together, the text and woodblock-printed illustrations provide information on an important area of Chinese mechanical arts. This clock's escapement, termed a celestial balance (*tianheng*), controlled the gears and rotated the celestial globe and armillary sphere. Unlike Western clocks, Su's great astronomical clock tower was powered not by a falling weight but rather by scoop wheels that used water.

Su Song's astronomical clock had a five-story pagoda in the front, and each story had a door. At the appropriate time manikins appeared, ringing bells, banging gongs, beating drums, or holding tablets to show the hour. There were 117 manikins in total. The large water-powered scoop wheel set the clock in motion.

Su Song's text has since inspired a long line of scholars, making his one of the most famous of early clocks in both China and the West. The descriptions and accompanying illustrations in the original work have enabled a number of working models to be made, all of which bring to life a long-forgotten achievement in Chinese mechanical arts.

even smaller than before. The invention of the balance spring has been attributed to Huygens, in 1675. However, while Huygens was the first to construct a watch with a balance spring, his contemporary, Robert Hooke (1635–1703), claimed to have developed the idea first. Recent evidence in support of Hooke's claim appears to have put an end to the centuries-long controversy.

The last great development in Western horology was the marine chronometer, an accurate timekeeper that could be used at sea. In 1660 both Huygens and Hooke tried unsuccessfully to construct such an instrument, and in 1661 Huygens produced a pendulum-powered marine clock that was of use on calm water only. With

a strong need to solve the problem of determining exact longitude in open water, in 1714 the British government offered a prize of £20,000 to anyone who could accomplish this. In 1761 John Harrison (1693–1776) found success with his chronometer. The precision of this timekeeper significantly increased England's power at sea by giving the country an enormous advantage over other seafaring nations and made England the leader in timekeeping technology.

When the Jesuits arrived at the Chinese court in 1601, they carried with them clocks and watches that represented the latest in European timekeeping technology. Although not terribly accurate, these clocks were small and portable

and could chime the hours. The enthusiastic response to these gifts led the Jesuits to believe that the Chinese never had any type of mechanical clock. However, the Chinese had invented a type of mechanical clock nine centuries earlier, predating the European verge and foliot escapement by 500 years.

It was generally believed that the first mechanical clock in China was that of the Tantric Buddhist monk Yixing (638–727) and the scholar Liang Lingzan, constructed in 725. This clock was powered by water and had a type of escapement that caused a wheel to turn automatically. However, evidence suggests that the mechanical clock may have existed at least several decades before Yixing's creation. An eighth-century text describes a "twelve double-hour wheel" dating to 692 that contained a "great regulator" (*dayi*). This was very likely an armillary sphere that had an early form of escapement.

Following these first mechanical clocks came the mercury-driven astronomical clock of Zhang Sixun (fl. 979). This clock, presented to the emperor Tang Taizong in 979, used a scoop device to turn the wheel and had bells to ring the hours and jack-work manikins bearing tablets to show the time. Unlike water that froze completely, mercury only partially froze in winter, which ensured that the mechanism continued to operate in colder weather, although it still had some problems in extreme temperatures. The clock was a three-story structure powered by a vertical transmission shaft and featured an armillary sphere mounted on the top that was used to observe the positions of the stars. It also had horizontally mounted jack-work that signaled the time by presenting tablets with the time written on them and by ringing bells, banging gongs, and beating drums.

The most famous of Chinese mechanical clocks is detailed in a text by the Chinese astronomer Su Song (1020–1101), who described a great mechanical clock tower, constructed in 1088, featuring a celestial globe and an armillary sphere. The escapement, called a *tianbeng* (celestial balance), was powered by scoop wheels that used water to control the gears and rotate the celestial globe and armillary sphere. The clock survived in the city of Kaifeng until 1126, when the invading Jin took the clock to Beijing,

where it fell into disrepair. In the late twelfth century, it was badly damaged by lightning; not long afterward, the bronze armillary sphere was left behind when the Jin fled the Mongol invasions.

The last major development in native clockwork technology came about in the Yuan dynasty, when the Chinese mathematician, civil engineer, and astronomer Guo Shoujing (fl. 1280) resided at the Mongol court of Kublai Khan. Guo made two clocks for the ruler, both of which had jack-work powered by water. He also made a mechanically rotating celestial globe that worked like those of Zhang Heng and Su Song before him. Unfortunately, it is no longer extant, as it was melted down at a later date. With the fall of the Yuan dynasty in 1368, much of what the Mongols had built, including their water-powered clocks, was destroyed. Clock-making tradition was not eradicated, but little remained of its former glory.

By the late sixteenth century, native achievements in mechanical clockwork were long forgotten. When the Jesuits arrived, they were never to know that Chinese technology in this area had been well advanced, with gear work—such as that of Su Song's clock—that was not only well able to provide the power to rotate wheels and activate fancy jack-work but was also more accurate than early Western clocks.

Although the horological traditions of China and Europe are distinctly different, both divided time into equal beats, showing different solutions to the same problem. Ultimately, however, it was the mechanism of the European clock that held far more potential.

The Fifth Dalai Lama and Advances in Tibetan Medicine

The Tibetan "Science of Healing," also known in Tibetan as Sowa Rigpa, is one of the great Asian medical traditions along with Chinese medicine and classical Indian medicine (Ayurveda). A unique feature of Tibetan medicine is the cosmopolitan nature of its origins, resulting in a fundamental medical text entitled *Four Medical Tantras* (in Tibetan, *Gyue Shi*). In this and other early medical texts dating back to at least the twelfth century CE, we find influences from Chinese, Indian, and Arab medical traditions. These were adapted to the climate and high altitude of Tibet and combined with indigenous knowledge, in particular Buddhist wisdom and local pharmacology. Over the centuries many commentaries have been written on the *Four Medical Tantras*, elucidating their intricate details. One issue that commentators hotly debated was whether this four-volume treatise was an original Tibetan work or whether it was taught by the "Medicine Buddha," a manifestation of the historical Shakyamuni Buddha. When the Fifth Dalai Lama, Ngawang Lobsang Gyatso (1617–1682), arose as a powerful leader in Tibet and politically unified this vast country in 1652, the debate about the origin of the *Four Medical Tantras* was at its height. The Dalai Lama and especially his posthumous regent, Desi Sangye Gyatso (1653–1705), likewise took great interest in the text. Moreover, following the Dalai Lama's death, Desi Sangye Gyatso would advance medical learning by writing concise commentaries on the theory, practice, and history of Tibetan medicine, producing a unique series of 79 medical scroll paintings and establishing Tibet's first

medical college, continuing the Fifth Dalai Lama's reformation of Tibetan medicine.

After the Fifth Dalai Lama's unification of Tibet, which local clans and kings had ruled since the twelfth century, a new era started not only politically but also in the fields of religion and culture. The related yet frequently warring clans and rulers practiced streams of Tibetan Buddhism that differed from the more widespread forms of Buddhism practiced elsewhere in Asia. The Dalai Lama propagated the Gelugpa tradition of Tibetan Buddhism that stressed monastic discipline, astute learning, and debate, hence Gelugpa monks' name, which means "the ones of the virtuous path." Many monasteries were soon converted into Gelugpa establishments, the local rulers to a large extent lost their influence, and tax payments were now made to the new centrally administrated state in which religion and politics were inseparable. Through favorable bonds with the Mongols, Tibet again gained considerable power in Asia. Internally,

A medical thanka from a version of the commentary on the ancient *Four Tantras*, the fundamental treatise of Tibetan medicine. The commentary was prepared by Sangye Gyamtso (1653–1705), Regent of Tibet, as an attempt to codify Tibetan medical science. (Werner Forman/Corbis)

► TIBETAN MEDICAL THANKAS

The Tibetan Medical Thankas are a unique set of scroll paintings that illustrate Tibetan medical theory and practice in great detail and color. The stated aim of the Tibetan regent Sangye Gyatso (1653–1705), who commanded this piece of art and science, was to clarify one of his commentaries on the core Tibetan medical text the *Four Medical Tantras*. Most importantly, the paintings advanced understanding of anatomy, embryology, and materia medica and helped both to clarify and standardize the locations of the points where moxibustion (treatments in which herbs are incinerated or hot iron rods are placed on certain points of the body) and bloodletting are performed. In Tibetan medicine these latter fall under the category of external treatments, as opposed to the much more commonly used internal treatments. Those consist of ingesting compounded medicines, which can contain up to 120 different herbal, mineral, and animal ingredients. The craftsmanship of the medical Thankas is remarkable, and while some have large paintings that fill the whole scroll, many consist of minute drawings placed in close sequence, reminiscent of modern-day cartoons. This first set of Thankas was later copied, and today sets of the Thankas are held at the Tibetan medical hospital in Lhasa and at the Museum of the History of Buryatia in Ulan Ude, the capital of the Republic of Buryatia in Siberia.

—Theresia Hofer

the theocratic government devoted an increasing amount of resources to innovations in the fields of religion, astrology, and medicine. To hold together such a vast land as Tibet, having a multitude of local traditions, languages, and cultures required carefully tied alliances, a good administration, and a powerful army. The promotion of a more standardized understanding of human health and suffering could be considered a subtler yet equally important part of this ambitious enterprise. The Fifth Dalai Lama invited physicians from many places in Tibet to Lhasa to practice at his court. He studied Tibetan medicine with them, but it was the regent Sangye Gyatso, ruling after the Fifth Dalai Lama's death, who brought his work in the field of medicine to fruition.

Sangye Gyatso was open to, yet critical of the medical traditions embodied by different court physicians. He found much confusion in medical and historical writings, and after studying with his teachers, perusing many of his predecessors' works, and discovering new versions of older texts, he completed a new edition of the *Four Medical Tantras*. He then wrote two commentaries on this that are still well respected and in current use. He had the idea of linking one of the commentaries, "Blue Lapis Lazuli," to visual illustrations. For this he used extant sketches by Tibetan physicians. He also called on pharmacology experts from far and wide to validate and clarify plant identifications and had the best available artists collaborate closely with him and his physicians in transforming all of this medical and pharmacological knowledge into accurate illustrations. The result was an amazing and comprehensive series of 79 scroll paintings, called Thanka, that illustrate in great detail and color what previously had only been studied on the basis of texts and oral explanations. Moreover, in 1696 the regent established a medical college in Lhasa at a prominent location on top of the "Iron Hill" opposite the Potala Palace. The Medical Thanka were exhibited at this college as a study aid for students who had been recruited from monasteries throughout Tibet. Many of the graduates from this college later became court-physicians for the ruling elite of Tibet or returned to their monasteries to set up medical colleges. Thanks to all of these efforts, Tibetan medicine was again considered an important branch of the ten Tibetan Sciences, along with such areas of knowledge as Buddhism, logic, astrology and others.

Following the innovations introduced by Sangye Gyatso and due to the vast power that Tibet had once again gained under the Fifth Dalai Lama, Tibetan medicine spread throughout and beyond its homeland. It was soon practiced in the Himalayan kingdoms of Bhutan, Ladakh, Nepal, and Sikkim in the south but also went north to Mongolia and Buryatia. This heritage still survives and develops distinctively in these countries as well as in the country where it originated, today administered by the People's Republic of China.

Early Modern European Archaeology

While the archaeology of the early modern period differed substantially from modern archaeology, many in the West practiced archaeology—the study of material culture—in the technical sense. The term “archaeology” was first used in English in the seventeenth century, but most archaeologists would have preferred to call themselves natural philosophers (the early modern term for a scientist) or, more often, antiquarians (those who study ancient material and textual objects). Early modern antiquarians rarely devoted their full time to the study of archaeology, and therefore they were not professionals in the modern sense. Still, they formed societies dedicated to studying ancient material culture, and they published countless books and essays on their discoveries.

Several important events contributed to the development of archaeology in early modern Europe. Perhaps most importantly, the movement that became known as the Renaissance encouraged scholars to meticulously study the remains of classical Rome and, to a lesser extent, Greece. Throughout much of the early modern period, the focus on classical culture was primarily textual analysis. However, a number of scholars, artists, and architects turned their attention to classical statues, temples, and public buildings, particularly those in Rome. Helping to drive their interests were numerous kings, princes, and church officials who spent enormous sums to collect antiquities for their collections. In fact, those with the best collections could point to it as a sign of status. Kings and nobles also became patrons of scholars who, in turn, studied their collections. By the end of the seventeenth century, scholars, kings, and nobles worked together

to establish academies and societies dedicated to studying subjects such as natural philosophy, archaeology, and inscriptions. The infrastructure upon which the modern profession of archaeology was built had been established.

Early modern collecting was not limited to Roman and Greek artifacts. Europeans also collected prehistoric objects that they found buried in fields and tumuli throughout Europe and North America. While not always certain how to classify these objects—arrowheads were often thought to be elf-shot or thunderbolts—they displayed them in curiosity cabinets. Importantly, the prehistoric objects that they found were understood within the context of biblical scripture, classical philosophy, and local tradition. Thus, prehistoric remains were always dated according

➤ FLINT CERAUNITES

By the eighteenth century, the idea that arrowheads were thunderbolts or elf-shot fell out of favor with many scholars. However, some earlier writers had already suggested this. In this selection, Michele Mercati (1541–1593), an Italian natural philosopher, describes their origins. This passage suggests that antiquarians could study transformations in ancient human societies by analyzing developments in their material culture.

“The ‘ceraunite’ is common in Italy; it is often called an ‘arrow’ and is modeled from thin, hard flint into a triangular point. Many believe that they are cast down by lightning; yet those who study history judge that before the use of iron they were struck from very hard flint for the folly of war. Indeed, for the most ancient peoples, pieces of flint served as knives. We read in the holy scriptures of how Sephorah, the wife of Moses, circumcised her son according to Israelite custom, with a well-sharpened stone. . . . In the period we are considering there was no worked iron in lands of the West; boats, houses, and all other works were fashioned with sharpened stones.”

to the biblical 6,000-year timeline. This inhibited the development of stratigraphy, an archaeological tool that links an artifact's age to the geological layer from which it is excavated. Not until the mid-nineteenth century was stratigraphy used widely in archaeological practice.

From 1492, the European plundering of the Americas brought back artifacts from these continents that were displayed side by side with classical and prehistoric objects. In the wake of Europe's Scientific Revolution of the seventeenth century, natural philosophers increasingly attempted to analyze and classify these objects. Through studying their material cultures, natural philosophers increasingly equated the indigenous peoples of the Americas to the earliest Europeans and peoples of the Near East. Both were seen as primitive, less-civilized versions of early modern Europeans. From this perspective, a theory of cultural evolution developed in the Enlightenment, which privileged European civilization over all others. Thus, archaeology became a tool to justify European imperialism and its so-called civilizing mission into the nineteenth century.

Rice Culture from Angola to South Carolina

Between the fifteenth and eighteenth centuries, rice cultivation increased in acreage in Japan

and migrated to the New World. While peasants in Asia and Africa continued to grow rice on small paddies for local consumption, in South Carolina slave owners relied on African slaves to produce a surplus rice crop for export. Whether in the Old World or the New World, the cultivation of rice required heavy labor, particularly in preparing a paddy for planting and inundation. Harvests brought a brief respite from the demands of cultivating rice.

In their explorations the Portuguese found rice cultivated throughout West Africa. In Gambia farmers grew rice in marshes and along the Gambia River, where it could be easily irrigated. Where rain sufficed, farmers in Guinea grew upland rice, which did not need irrigation. Farmers there planted rice after having cleared the ground of trees and burning the debris. In the seventeenth century the introduction of iron tools throughout West Africa changed rice culture. Now able to hack out mangrove trees at the roots, farmers planted rice in swamps that had been mangrove forests. The production of rice found a commercial outlet: slavers bought it to stock their ships for the Atlantic crossing. In the seventeenth century Europeans also encouraged Africans to grow Asian varieties of rice rather than indigenous strains in the belief that African rice was inferior. Because Europeans were willing to pay for Asian rice, farmers throughout Guinea-Bissau planted it at the expense of indigenous varieties. Reflecting this European market for rice, in 1725 one Frenchman found rice for sale wherever he went in Guinea-Bissau.

As in Africa, the cultivation of rice in China had roots in antiquity. The Yangtze River valley was the center of rice culture, and in the fifteenth century peasants migrated into the already populous valley to grow rice. These peasants grew rice to pay rent in a sharecropping system. Landlords took roughly half the rice crop as rent, leaving peasants the other half. The rise in population from 70 million in 1400 to 270 million in 1770 indicates a corresponding increase in rice production. Part of this increase came from a more than doubling of cultivated land between 1400 and 1700. Yet the fact that population grew faster than cultivated

acreage implies an increase in yield per acre of rice.

As in China, farmers in Japan expanded rice-growing acreage after 1600, experimented with new varieties, and built new irrigation canals. Until the eighteenth century Japanese peasants, like their counterparts in China, operated in a sharecropping arrangement, giving their landlords rice as rent and subsisting on buckwheat and barley. After 1700 landlords demanded rent in cash, leaving peasants free to sell their rice or, selling other crops instead, to keep rice for their own use.

After experimenting with other crops the English inhabitants of South Carolina began growing rice around 1685. Presumably this rice was from Asia, although around 1690 the English imported rice from Madagascar, and this variety became the mainstay of rice culture in South Carolina. The African influence on rice cultivation went beyond the variety of rice planted. The slaves whom South Carolinians imported into the colony brought with them knowledge of how to grow rice. Prizing this knowledge, the planters of South Carolina sought slaves with such expertise. By one estimate, 43 percent of slaves imported into South Carolina in the eighteenth century came from areas where rice was a staple. With unpaid blacks supplying the knowledge and the labor, production soared from 10,000 pounds (4,500 kilograms) in 1698 to 83 million pounds (37.6 million kilograms) in 1770. Production on this scale demanded extensive irrigation. The collection of water into ponds and the digging of canals between pond and field worked well on a small scale. Around 1750 planters began harnessing the tide to irrigate their fields, using gates to capture freshwater, which the ocean pushed ahead of it as it rose.

In Asia and Africa the cultivation of rice has remained a way of life. In South Carolina it withered away, stagnating and then declining in the nineteenth century so that by 1900 the rice plantations of the eighteenth century were nothing more than a memory. In this respect the cultivation of rice has been a more powerful historical force in Asia and Africa, where it continues to shape daily life.

—Christopher Cumo

➤ RICE CULTURE IN COLONIAL SOUTH CAROLINA

Henry Laurens, Virginia planter.
(Chaiba Media)

Alexander Garden was a physician and botanist in South Carolina, who observed how slavery abused African Americans. In vivid language, he describes the tedium and difficulty that African Americans faced in cultivating rice.

“Our Staple Commodity for some years has been Rice, and Tilling, planting, Hoeing, Reaping, Threshing, Pounding have all been done merely by the poor slaves here. Labor and the Loss of many of their lives testified [to] the Fatigue they Underwent, in Satiating the Inexpressible Avarice of their Masters. You may easily guess what a Tedious, Laborious, and slow Method it is of Cultivating Lands to Till it all by Hand, and then to plant 100, 120 Acres [40–50 hectares] of Land by Hand, but the worst comes last for after the Rice is threshed, they beat it all in the hand in large Wooden Mortars to clean it from the Husk, which is very hard and severe operation.”

—Christopher Cumo

The Pocahontas Exchange— Tobacco Culture in Virginia, 1610s

Tobacco was one of the great discoveries of the Americas, for both indigenous peoples who learned how to cultivate it and Europeans who adapted it to their tastes and made it a significant staple crop. Many Native American groups used tobacco, incorporating the plant into political and spiritual ceremonies, and it was one of the first New World crops to which Europeans took a liking. Columbus's mariners smoked tobacco, and it was prominently featured in many early European descriptions of the New World. Throughout the sixteenth and seventeenth centuries, physicians praised its health benefits, and

medical manuals popularized the fallacy that tobacco was a cure for another product of the New World: syphilis. Tobacco smoke certainly did not manifest these health-giving properties, but the plant undoubtedly made many people rich, beginning with its earliest commercial cultivators in the Spanish New World empire.

Tobacco comes in many varieties with different characteristics. The Spanish developed a particularly palatable variety cultivated in Spain's Caribbean colonies that became known as Spanish tobacco. Spanish tobacco had acquired a dominant position on the European market by the end of the sixteenth century, a position that the Spanish worked hard to maintain. The English, who mostly smoked tobacco in pipes, were among avid users of the crop.

The English settlers who established their first permanent settlement at Jamestown in the Virginia Colony in 1607 found that the tobacco cultivated by local Powhatan people was too bitter for European tastes to be a profitable export crop. John Rolfe (the husband of Pocahontas), a settler with a tobacco addiction and an interest in alchemy, experimented with the local product in an attempt to make its flavor smoother and more marketable, but he eventually gave up. The solution he adopted was to import tobacco seeds from the Spanish Caribbean. But Spanish authorities protected their monopoly by forbidding others to obtain their superior seed. The seed would have to be smuggled from the Spanish plantations. In 1613 Rolfe was the first Virginian to obtain the smuggled seeds of a variety of Spanish tobacco called Oronoco, or tall tobacco, smuggled from Trinidad or Bermuda in the Spanish Caribbean.

Obtaining the tobacco was only the beginning of the establishment of a tobacco industry in the new colony. Although the tobacco they were growing was different, settlers with no experience in tobacco cultivation had the advantage of being able to draw on the expertise of local Native Americans of the Powhatan tribe. Tobacco went from many stages between planting and consumption. Protecting the growing plants from worms and weeds required great care. The harvesting of the tobacco plants in August was followed by the drying of the leaves. The Jamestown planters initially followed the

► JAMES I ON TOBACCO

Ironically, the king after whom Jamestown was named, James I, was one of the greatest opponents of tobacco in Europe. His *A Counter-Blaste to Tobacco* (1604) denounced the herb in scorching terms as unhealthy, sinful, and disgusting:

“And for the vanities committed in this filthie custome, is it not both great vanitie and uncleannesse, that at the table, a place of respect, of cleanelinesse, of modestie, men should not be ashamed, to sit tossing of Tobacco pipes, and puffing of the smoke of Tobacco one to another, making the filthy smoke and stinke thereof, to exhale athwart the dishes, and infect the aire, when very often, men that abhorre it are at their repast? Surely Smoke becomes a kitchin far better then a Dining chamber, and yet it makes a kitchin also oftentimes in the inward parts of men, soiling and infecting them, with an unctuous and oily kinde of Soote, as hath bene found in some great Tobacco takers, that after their death were opened. And not onely meale time, but no other time nor action is exempted from the publike use of this uncivill tricke.”

—William E. Burns

King James I, *A Counter-Blaste to Tobacco* (Edinburgh, UK: E. and G. Goldsmid, 1885 [1604]), 29–30.

indigenous practice of piling the leaves on the ground for drying, but around 1618 Thomas Lambert began hanging the plants vertically in a shed for quicker and more even and efficient drying. This became the standard practice in Virginia, eventually taking the form of hanging the entire plant in a tobacco house, constructed with loosely connected walls that allowed the moisture to be carried off by the breezes.

Following drying, the tobacco leaves were stripped from the stems and pressed into wooden barrels, or hogsheads, holding about 50 pounds (23 kilograms) apiece, which kept it in good condition and impeded smuggling, as tobacco was a heavily taxed commodity. The barrels were loaded onto ships that plied the placid waterways that honeycombed Chesapeake Bay and then were carried to England. From England, the leaves were reexported to Europe, where they were further processed into cigars, pipe tobacco, and snuff.

Tobacco growing and processing were labor-intensive. Much of the hard work was at first done by English indentured servants and eventually by African slaves, the first shipment of which arrived in the colony in 1619. Tobacco

proved to be the economic salvation of the struggling Jamestown colony, particularly after Rolfe promoted the Virginia product during his visit to England with Pocahontas in 1616. The subsequent tobacco boom became so frenetic that colonists reportedly grew it in the streets of the town and even in the cemetery.

Virginia's economy continued to be based on tobacco through the seventeenth century, and tobacco was even treated as a medium of exchange, like currency. The colonists gained a monopoly over the English tobacco market, producing enough for home consumption and further export into lucrative continental markets as well. Virginia tobacco acquired a European reputation for its high quality. Even after the Chesapeake economy diversified in the eighteenth century, tobacco remained a major source of wealth and the single greatest export from the British American colonies.

■ Introduction: New Technologies of Learning

The rise of new technologies of learning was intimately bound up with the rise of new knowledge, particularly in the sciences. Although the period saw little direct application of new scientific knowledge to create new technologies (one exception was Benjamin Franklin's lightning rod), many scientists were involved in technological research, and technological innovations such as the printing press enabled the dissemination and preservation of knowledge on an unprecedented scale. (The brilliant mechanical and anatomical studies of artist Leonardo da Vinci had very little impact on European thought because they were not circulated through print.) The printing press also drove a great expansion of literacy and contributed to the spread of education. Cheap textbooks could spread reading and writing to all but the poorest Europeans, although

the degree to which Europeans made use of this possibility varied greatly in different nations.

New technologies also created new objects of knowledge. Inventions such as the telescope and the microscope allowed investigators like astronomer Galileo Galilei and "microscopist" Antoni van Leeuwenhoek to discover phenomena that had previously been entirely unknown, such as the moons of Jupiter or the "animalcules" found in human semen. New meteorological instruments such as the barometer enabled the measurement of different qualities of the air, making the atmosphere an object of knowledge.

In other cases, new knowledge forced technology to adapt to it. A classic example is Western cartography in which the store of knowledge was vastly expanded following the voyages of Columbus, Vasco da Gama, and their successors.

This led to the development of new cartographic techniques. The resulting maps could then be accurately reproduced and distributed in standardized form with the use of the printing press. Expansion also drove research in navigational technology, with spillover effects in areas such as the study of magnetism and horology (the making of accurate clocks). The drive to create more accurate timekeepers for both land and sea absorbed the efforts of many European scientists, and the ability to measure smaller and smaller intervals of time opened new possibilities for scientific research.

Early modern Europeans were building on the technologically dynamic Middle Ages, and although ancient Greek and Roman technological writings were read, there was no classical revival in technology as existed in other fields. Many, of whom the most famous is the English philosopher Francis Bacon, hoped for the improvement of the world and human power over nature through further technological improvement. The opposite phenomenon in many ways was happening in the world's previous technological leader, China, the location of the original invention of the printing press. China was losing much of its technological dynamism. The Chinese imperial court was interested in new Western technologies. A telescope was presented to the emperor in 1634. Clocks and other mechanical devices were of particular interest to Chinese collectors, but despite the fact that China had led the world in the sophistication of its clocks in the Middle Ages, the new Western devices did not spark Chinese interest in imitating or even improving them. The Islamic world was similarly reluctant to adopt the new technologies of learning, partly due to their implicit threat to religious authority.

—William E. Burns

Technologies of the Word— Movable Type and the Printing Press

Printing with movable type involves a separate block for each letter or character, which is then composed to produce a printed page. Like the printing press itself, printing with movable type was first invented in China. Chinese printers initially used ceramic or wooden blocks.

The first system of metal movable type was invented in Korea in the eleventh century and was eventually adopted in China as well. China and Korea, however, were limited in their ability to fully exploit movable type by the huge number of Chinese characters, which would require an immense number of blocks in a printing shop. Movable type was used for some large projects, however, such as the massive Qing dynasty encyclopedia *Guji-n Tushu-Jicheng*, whose 5,040 volumes were printed with bronze movable type.

In the early 1450s, movable type printing was introduced to Europe by Nuremburg artisan Johannes Gutenberg. Historians still debate whether Gutenberg's invention of printing was independent or was influenced by the East Asian tradition of printing, which had already existed for centuries. There is no direct evidence of East Asian influence on Gutenberg, but it cannot be ruled out.

Gutenberg's invention had a profound impact on European culture. The English philosopher Francis Bacon (1561–1626) would identify it, along with gunpowder and the magnetic compass, as one of the three inventions that marked the modern age. Such was the impact of printing that many argued that it was a gift of divine providence. The book was also the first mechanically mass-produced object, blazing a trail for industrialization and standardization.

The best-known work from Gutenberg's press, the Gutenberg Bible, was published in 1456. Printing first spread to other areas in the Rhineland and then to the humanistic and religious centers of Italy. The 1470s saw the rapid dissemination of printing throughout Europe, and it was found in all European countries except the Ottoman empire by 1490. Printing enormously increased the volume of written words in Europe. Roughly 8 million copies of over 40,000 books were printed in the first 50 years of printing, a figure comparable to the number of manuscripts produced since the fall of the Roman empire. As many as 50 million may have been produced in the next 50 years. The number of books sometimes exceeded the ability of Europe to absorb them. As early as 1472 Rome saw a crash caused by the overproduction of books, with a subsequent price collapse and the failure of many printers.

Printing changed culture in many ways. It was connected to a great increase in literacy and the development of new literatures and new publics, particularly as printing grew more common and printed items became cheaper. Printing not only enabled the much wider distribution of books and other written works but also changed their nature. Although copies of a book often had slight differences, printed books were standardized to a far higher degree than manuscripts could be. The printed text was “fixed,” far less vulnerable to the kinds of corruptions that came in when a manuscript was copied. The vast number of printed books meant that texts were far less likely to be lost than in the manuscript era. Despite these advantages, printing did not destroy manuscript culture. Many early printed books imitated manuscripts, and some manuscript books were actually copied from printed books. Printed books were initially sold in the established outlets for selling manuscript books and were housed in the same libraries, although the sheer volume of printed material eventually forced an enormous expansion of the infrastructure for holding books. Manuscripts continued to circulate when only a very small number of copies was needed or wanted or when an aristocratic or female poet shunned the commercialism or public role of print.

For religious and political authorities, printing was a double-edged sword. Governments and churches employed the press to circulate their own decrees or propaganda. Printing enabled an expansion of the church-dominated educational sector, with the production of standard textbooks. However, given the capacity of one printer to produce hundreds or thousands of copies of a subversive text or image, a print culture was also harder to police than a manuscript one. One difference between the Protestant Reformation and previous movements against the Catholic Church such as Lollardism was that Protestants were able to distribute their writings far more widely in far more copies. The Church attempted to control printing through the Index of Forbidden Books, a list of books that Catholics were forbidden to own or read established in 1557 and only abolished in 1966. (In addition to attacking Protestant printing, the Church also sought to control the growth of Jewish

WORKING THE PRESS

Printing presses worked by forcing sheets of paper together with ink-covered type made from an alloy of lead and antimony. Individual pieces of type, each bearing a letter, punctuation mark, or space, were put together on an iron rod, called a composing stick, by a composer, the most highly skilled printing worker. This task required literacy and was particularly difficult because the text had to be loaded backwards so as to appear the right way on the page. Groups of lines were set in galleys, wooden cases that were then set into an iron chase, which collected the lines for an entire page. The type in the chase was smeared with ink, and the chase was securely fastened to the stone bed of the press. The moistened sheet of paper was placed in a wooden frame hinged to the chase, and the two were brought together. A pressman brought down the platen, which forced the chase and the paper together so that the ink was transferred to the paper. He did this by pulling a lever that turned a screw. While the compositor was a skilled worker, the pressman’s primary qualification was the muscular strength to bring the platen down with sufficient pressure. The printed paper was then removed from the press and hung up to dry.

—William E. Burns

printing.) Established Protestant churches instituted censorship regimes of their own, often working hand in hand with the state. Areas of greater religious pluralism, such as the Dutch Republic, were often areas of greater press freedom. Although printing was generally freer in Protestant countries, the Republic of Venice, where the government was often at odds with the Church, was a center of relative press freedom in the Catholic world.

European governments maintained censorship to control the circulation of dangerous political ideas. Weak governments also contributed to free printing. The collapse of central government authority in the English Civil War of the mid-seventeenth century led to an explosion of printing in which radical religious views found their way into print. A similar phenomenon took place during France’s contemporary Fronde rebellion.

The possibility of losing control over the dissemination of religious ideas is one reason why the Islamic world was slow to adopt printing. Although Ottoman authorities were aware of European printing, opposition from conservative religious scholars kept printing out of Islamic lands for centuries. The Ottoman sultans Bayezid II and Selim I issued decrees against printing in 1485 and 1515, respectively, although this ban applied only to Muslims. Christians and Jews were free to operate presses in the empire. It was not until around 1720 that a Muslim-owned and -operated press was introduced in Istanbul.

Chinese Printing—Technological Innovations and Their Cultural Implications, 1500–1800

During the latter half of the Ming Dynasty (1368–1644), economic and demographic advances fostered a printing boom that extended the reach of printing technology and its effects both geographically and socially. By the beginning of the sixteenth century, printing had been in use in China for more than seven centuries. However, political and economic disruptions during the mid-fourteenth century had led to a scaling back of government and commercial printing. Printing activities did not surpass the level of the thirteenth century until the late fifteenth and sixteenth centuries. The arrival of the Manchus and European missionaries during the last century of Ming rule then set the stage for the rise of a multilingual empire eager to promote distinct cultural traditions through printing projects and for its negotiations between different traditions of printing technology.

This Ming printing boom was not an age of technological innovation. Rather, economic and social transformations affected the operations of printers as well as the printed materials they produced. Increased production of cheaper bamboo paper, especially in the southeastern provinces of Fujian and Zhejiang, lured printers and led to a decline in production costs and book prices. Printers similarly reduced costs by gradually shifting from elaborate calligraphic styles to a standard artisanal style, employing straight character strokes. This more mechanical presentation required less skill from carvers and allowed for greater numbers of characters per page. New binding techniques for printed sheets further drove down costs and prices. Until the fifteenth century, the most common types of binding required book binders to paste printed leaves into a stiff paper cover and then pierce holes in the spine and weave through paper threads to hold the leaves together. In time, silk or cotton reinforced the paper threads. By the sixteenth and seventeenth centuries, pasting gave way to stitched binding. Binders folded the printed leaves, stacked them, and then pierced holes, typically four, through the leaves and the cover sheet. After threading, these volumes proved to be more durable and compact and thus more suitable for shipping and storing.

As books became more widely available and affordable, well-to-do readers sought high-end books with a different look and feel from the standard editions with artisanal fonts printed on rough bamboo paper. Print shops in some of the better-known urban centers, such as Nanjing and Huizhou, capitalized on this niche market and put out exquisite multicolor volumes. Whereas color printing had been previously limited to single-sheet prints and occasionally classical texts, hundreds of novels, plays, and classical literary and medical texts as well as art albums and paintings manuals were printed in color during the late sixteenth century and the seventeenth century. Such editions were typically printed in two to five colors, each color applied in different stages, using smooth and absorbent high-quality papers.

As in the twelfth century, the second boom in Chinese printing corresponded to the growth in the number of men preparing for the civil

service examinations. According to one conservative estimate, the number of imprints rose from an average of fewer than 10 titles per decade between 1368 and 1468 to more than three times that number in the following century and reached an average of 53 titles per decade in the last four decades of the sixteenth century. The number of graduates of the lowest-level examinations during these centuries shows a similar increase, rising from around 30,000 in 1438 to around 500,000 in the late seventeenth century. The number of students preparing for the examinations would have been much greater. The majority of the students and graduates did not succeed in higher-level examinations and were unable to obtain positions in the bureaucracy. However, they constituted a large reading public and were also increasingly drawn into the world of publishing. Between the sixteenth and eighteenth centuries students preparing for the examinations and graduates waiting for appointments worked in publishing as professional authors, compilers, editors, proofreaders, and printers. Some of them gained fame as best-selling authors and editors, specializing in classical and historical studies and examination aids or in works and critical studies of fiction.

Urbanization, especially in the lower Yangzi region, was a second factor shaping print culture in the sixteenth and seventeenth centuries. During the Ming dynasty print shops existed in all provinces of the empire, but the majority of imprints were produced in a few large cities, most notably Nanjing, Suzhou, Hangzhou, Huizhou, and Jianyang. Nanjing, for example, was the home of as many as 93 print shops. Authors and editors producing for the market were either residents of or conveniently located near these major urban centers.

After the Manchu conquest in 1644, these cities lost their dominance in the book market to Beijing in the North as well as to provincial cities and peripheral areas across the Qing Empire. Outlying towns such as Sibao, in the mountains of western Fujian Province, became printing centers, serving peripheral populations that had been previously excluded from the book trade of the large urban areas. As printing centers became dispersed, the reach of printed books moved down the social hierarchy. The late Ming period

witnessed a printing boom of vernacular literature as authors and printers of novels and dramatic literature began to address their works to commoner readers, the so-called uncultured men and women (*yufu yufu*). Consequently, printers in these sites produced a variety of primers, manuals, dictionaries, and works of popular literature such as collections of local songs. They also sent out peddlers and branch bookstore managers across wide areas to market books to families of commoners and to readers of both genders.

The arrival of Jesuit missionaries in the second half of the sixteenth century resulted in the exchange of European and Chinese traditions of learning. The Jesuits and their Chinese collaborators translated and printed hundreds of titles on religious, scientific, technological, and historical topics. Sino-European cultural contact at the time did not challenge Chinese traditions of printing technology. The Jesuits used woodblock technology. It was not until the nineteenth century that woodblock technology was gradually replaced, not by typography but by lithography. Until this time, government and commercial printers in the Qing Empire produced thousands of titles, mostly by woodblock and also in movable type, in Chinese as well as in Manchu, Tibetan, and Mongolian. The systematic investment in the printing of languages other than Chinese was a new phenomenon and testifies to Qing dynasty efforts at creating a multiethnic imperial culture. Ironically, Manchu texts printed in the eighteenth century were to play a very different role in the twentieth century, when they became symbols of Manchu nationalist identity.

Technologies of Vision— The Telescope and Microscope

Although the optical properties of glass lenses had been known for centuries, it was not until the early seventeenth century that they were employed in radical extensions of human senses, the telescope and microscope.

The telescope emerged first. The earliest recorded description of a telescope combining a convex lens at the far end of a tube with a concave lens as an eyepiece occurs in a Dutch patent application in 1608. The inventor was a spectacle maker named Hans Lipperhey. The principle was so simple that much of the telescope's early spread was caused by people hearing about it

and building their own. Galileo Galilei made the most powerful telescopes of the time, with a magnification between 15 and 20 times. They enabled him to discover the largest satellites of Jupiter and the phases of Venus. The publicity given to his discoveries helped spread interest in telescopes and their astronomical uses. Another astronomer involved in telescope making was Johannes Kepler, inventor of the so-called astronomical telescope that combined two convex lenses and obtained greater accuracy of observation and a larger field of view at the price of turning the image upside-down. By the 1640s, telescopes based on Kepler's model were becoming standard for astronomy while diverging from the more common models whose uses included spying on enemy armies or identifying vessels at sea. The telescope brought home to astronomers the relative closeness of the planets in space and their similarity to the earth as opposed to the unimaginable distances and differences between the stars.

All of these refracting telescopes presented difficulties with unclear images and chromatic aberration (the splitting of the light coming from the object observed into different colors). Isaac Newton devised the reflecting telescope in 1668 to solve these problems and built the first in 1670, but producing effective reflecting telescopes was beyond the technological capacities of the seventeenth century. By the late seventeenth century, good refracting telescopes were widely available. Telescopic astronomy boomed as the invention of the micrometer and the addition of telescopic sights to standard astronomical instruments such as quadrants enabled the mapping of the heavens with unprecedented accuracy.

Both refracting and reflecting telescopes improved in the eighteenth century as London instrument makers displaced the Italians as leaders in telescope making. The chromatic aberration problem was solved by an English landowner and amateur scientist, Chester Moor Hall (1703–1771). Moor's telescope combined a convex lens of crown glass with a concave lens of flint glass. Workmen he contracted and supervised created the first achromatic refracting telescopes in 1733. Despite Moor's success, refracting telescopes were losing their astronomical usefulness. After the 1720s when instrument makers

Robert Hooke's compound microscope, an invention that greatly improved microscopy in the seventeenth century. (North Wind Picture Archives)

➤ ANTONI VAN LEEUWENHOEK

The greatest microscopist of the Scientific Revolution, the Dutch tradesman Antoni van Leeuwenhoek (1632–1723), was also one of the least-educated major European scientists. He never attended a university and was unfamiliar with Latin and French, the international languages of science at the time. Van Leeuwenhoek made more than 500 microscopes, favoring the single-lens design. Some were of exceptionally high quality, capable of magnifications of 270. While other scientists used microscopes to investigate particular interests such as medicine or natural history, for van Leeuwenhoek microscopy was an end in itself. He put an enormous number of things under the lens, including hair clippings, blood

samples, and items obtained from local businesses such as infested grain and pieces of butchered animals. During 50 years of observation, van Leeuwenhoek's skill, diligence, and patience enabled him to assert himself on the international scientific scene. His fundamental discoveries include red blood cells, the circulation of blood through the capillaries, the existence of protozoa, and the nature of the male sperm cells. Van Leeuwenhoek's house at Delft, full of microscopes set up with objects for visitors to examine, was a major tourist attraction, often making it difficult for him to carry on his research.

—William E. Burns

had learned to make reflecting telescopes, most astronomers employed them.

The exact origins of the microscope are unclear, but it was invented shortly after the telescope. The earliest examples were associated with the Dutch engineer Cornelius Drebbel (1572–1633). Drebbel's early designs, employing two convex lenses, were replaced by the late seventeenth century with the more efficient single-lens design, which avoided chromatic aberration. Systematic and widely distributed microscopic research did not emerge until the second half of the century and was closely associated with the Royal Society of London. Marcello Malpighi's *On the Lungs* (1661) and Robert Hooke's lavishly illustrated *Micrographia* (1665), which included several technical improvements to the microscope, inaugurated this new era.

The areas of science most affected by microscopy were natural history and anatomy. The most important anatomist to use the microscope was Malpighi, who published several microscopic studies on the structure of the human body, on the anatomy of the silkworm, and on the development of the chick embryo. Other microscopists studied plants, insects, and bodily fluids. Due to its difficulty and lack of an institutional base—microscopic anatomy did not become part of the curriculum at medical schools—microscopy began to decline by the late seventeenth century.

Of the two main types of early microscopes, the single and compound lens, the single lens was the more serious scientific tool. Most important discoveries were made with single-lens microscopes. Good microscopes became more widely available commercially in the eighteenth century and were used for diversion and entertainment as well as scientific research. London instrument makers dominated the eighteenth-century microscope industry. Their improvements were largely in the mounts and lighting of microscopes rather than in the magnification itself.

Compound microscopes, like refracting telescopes, were handicapped by chromatic aberration. The solution to this problem for telescopes was not immediately followed by the solution for microscopes. Although different lens arrangements reduced aberration considerably, reliable achromatic microscopes only became widely available in the 1820s.

Navigational Technologies

The dramatic expansion of the geographical range of European seafaring in the early modern period meant that navigation greatly concerned individuals, businesses, and governments. Navigational uses underlay the founding of the Greenwich and Paris observatories. Governments offered lavish rewards for successful navigational methods, and navigational problems engaged the attention of many scientists.

The magnetic compass, used for knowing the direction of a ship, was already in general use in the late medieval period by Chinese, Arab, and European seafarers. The earliest leaders in grappling with the complex navigational problems posed by long voyages on the open ocean were the Spanish and Portuguese. The Casa de la Contratacion, founded in 1503 to regulate Spanish movement to and from the New World, trained pilots and captains in cartography and navigation. The Portuguese naval officer Joao de Castro (1500–1548) made the first study of magnetic declination. A Portuguese mathematician and professor, Pedro Nunes (1502–1578), demonstrated that great circle routes were shorter than sailing in a straight line.

Of the two basic questions in fixing the position of a ship out of sight of land at a given moment—that of latitude (north-south) position and that of longitude (east-west) position—the first

was far less difficult. The altitude of the polestar or the sun above the horizon told the latitude. Portuguese sailors were using quadrants to determine the altitude of the polestar in the fifteenth century. South of the equator where the polestar was no longer visible it was necessary to use the sun, whose path was more complicated. Printed tables of the variance of the sun's apparent path around the earth, the ecliptic, from the equator assisted in this procedure, as did the invention of the backstaff by the English sea captain John Davis in the early seventeenth century. This enabled an observer facing away from the sun to take its altitude. (The old method, which required looking directly into the sun, took a heavy toll of sailors' eyesight.)

The longitude was a far tougher problem. As the celestial bodies seemed to rotate around the earth from east to west (the shift to Copernicanism made no difference to navigators, whose skills were based on the appearance of the sky, not the underlying reality), they could not offer a way to know one's position. Existing methods, based on lunar observation or simply estimating a ship's speed, were maddeningly and even dangerously imprecise. Most approaches to the longitude reduced the problem to that of finding the difference between the time on the ship and the time at a fixed point, usually that of the home port. The difference in time could be translated into spatial terms as the difference in longitude between the two points. There were all sorts of bizarre schemes for this, but the two main approaches were using astronomical objects to give the correct time and creating a clock able to give accurate time on a ship. If the home port time of a celestial occurrence was known, all that would be necessary would be to compare the ship's own time on observation of the occurrence. Galileo Galilei hoped that the movements of the satellites of Jupiter that he had discovered could be the astronomical clock, but the precise telescopic observations needed were impossible on board ships. The effort to create a clock that could be accurate on the rolling deck of a ship underlay many of the clock-making innovations of Robert Hooke, Christiaan Huygens, and others in the late seventeenth century, but these efforts were also in vain.

► GALLEONS, PORTOLANS, AND THE VOLTA DO MAR

The rise of ocean voyaging in the late-fifteenth- and sixteenth-century European Atlantic nations was accompanied by several new technologies or adaptations of old ones. The dominant ocean-crossing ships were the galleons. Galleons were multidecked sailing ships with three to five masts. Their bodies were made of oak, while the masts were made of pine. Galleons were adaptable to both commerce and war. They were very expensive and were usually built by governments or by merchant syndicates. Portolans were originally detailed charts of particular coasts for the use of sea captains and pilots. Originating in the Middle Ages, they were far

more detailed than most medieval maps. Individual portolans were eventually compiled into extensive maps of particular areas. The secrets that these maps contained were valuable, so they were not widely distributed. They were also vulnerable to corruption in copying and recopying. The Volta do Mar, a Portuguese phrase meaning “turn on the sea,” was a sailing technique of steering away from the destination in order to pick up favorable winds. The first well-known Volta do Mar was the one by which Portuguese vessels sailed back from voyages to Africa and in the South Atlantic.

—William E. Burns

Great Britain, with the world's largest colonial empire, took the lead in development of navigational technology in the early eighteenth century. The Longitude Act of 1714 established a prize for an accurate method of determining the longitude. The French Royal Academy of Sciences also established a prize. The first of two methods developed involved taking the distance between the moon and a fixed star and then comparing it to the time that distance would appear at a given point on land as given in a table, known as lunar distances. The leader in this effort was the astronomer royal, Nevil Maskelyne. The second method was an accurate clock devised by the English clockmaker John Harrison.

Although the new navigational technology was of inestimable use to European seafarers, it was not necessary for successful navigation. Some of the world's most impressive navigators were Polynesian sailors, who made their way across millions of square miles of vast, nearly landless water in the southern Pacific with a knowledge of the stars, the observation of ocean currents, and the flight of birds, among many other techniques.

The Order of New Worlds— European Cartography after Columbus

In sixteenth-century Europe, cartography, the science of mapping, was transformed by the humanist revival of the ancient cartographical tradition, by the vast increase in geographic information available to Europeans during the process of global expansion, and by the introduction of the printed, as opposed to the hand-drawn, map. The most common form of world map in the Middle Ages was that of Asia, Europe, and Africa huddled around Jerusalem at the center of the world. (This was known to be a flat representation of a spherical world; no educated person in the Middle Ages believed in a flat earth.) The continents were shown as crude outlines with no attempt to represent geographic detail. The Renaissance transformed maps radically.

The revival of the world system of Claudius Ptolemy, the ancient Greek geographer and astronomer, gave cartographers more sophisticated geometrical methods to represent an area on a map, although Ptolemy's focus on the

➤ ABRAHAM ORTELIUS

In 1570, Antwerp bookseller and cartographer Abraham Ortelius (1527–1598) published *Theatrum Orbis Terrarum* (*The Theater of the World*), often considered the first atlas. Although a capable mapmaker himself, he concentrated on collecting the maps, improving them, and reducing them to a common format. *Theatrum* was itself a printed and bound collection of mostly European maps, based largely on the studies of his friend Mercator. Ortelius also included a bibliographic commentary that has preserved the names of many obscure cartographers in what amounted to a history of cartography. *Theatrum* depicted North America as a wide continent rather than as a narrow barrier between Europe and Asia, as it had often been shown before. The frontispiece added a personification of America as a goddess to the traditional three of Asia, Europe, and Africa. With the prestige gained from *Theatrum*, Ortelius became official geographer to Philip II of Spain, the sovereign of Flanders whose globe-spanning empire was a preeminent consumer of cartographic services. *Theatrum* continued to be published in updated editions until 1612, appearing in 31 editions in seven European languages.

Mediterranean and Indian Oceans rather than the European continent made his usefulness for specific geographic data limited. New knowledge, beginning with the charts of the coast of West Africa and the Atlantic Islands produced by Portuguese seafarers in the fifteenth century, stimulated the creation of new maps while also introducing difficult problems in the reconciliation of different maps. Cartographers continued to accompany voyages and expeditions of discovery and conquest.

Maps were instruments of not only knowledge but also power. Governments attempted to control the process of mapping in order to prevent the knowledge they represented from falling into the hands of rivals. In the colonial realm, mapping both facilitated invasion and functioned as a symbolic expression of power. To map a country and to name its geographical features was to control it. In 1503, King Fernando of Aragon founded the Casa de Contratacion in Seville. It included a repository of maps. In 1512, the royal pattern, a continuously updated cartographic pattern, was established at the Casa de Contratacion. In addition to permitting the coordination of observations from different Spanish voyages, the Casa de Contratacion kept this knowledge under Spanish government control, although the effort was ultimately a failure.

One of the main problems in keeping cartographic information secret was the rise of printing. America began to appear in maps printed outside Spain rather early. The first published map to include the word “America” was the German Martin Waldseemüller’s *Cosmographica* (1507). In addition to leading to much wider and freer dissemination of maps, printing made it possible to produce large numbers of identical, standardized maps. The two most important cartographers of the sixteenth century, two Flemings and friends, Gerhard Mercator (1512–1594) and Abraham Ortelius (1527–1598), both issued printed maps. Mercator devised the projection of the earth’s spherical surface onto the flat surface of a map that bears his name. The term “atlas” is derived from Mercator’s reference to the ancient Greek Titan who held the world on his shoulders in his later three-part collection of world maps, *Atlas* (1585, 1590, 1595).

Maps served many purposes. Some were promotional. The earliest English maps of the New World, for example, encouraged investment in New World expeditions by emphasizing easy access to the wealth of China and Japan through a wide, and yet to be actually discovered, Northwest Passage. Based more on hope than observation, such maps were essentially fictional. Even maps with some pretensions to accuracy varied widely, both in the information they conveyed and in the features they emphasized. Military maps depicted fortresses and the connections between them, whereas maps designed for merchants identified natural resources and trade routes. Cultural and economic differences influenced mapping styles. Seventeenth-century Dutch maps of upstate New York traced vital waterways and trade routes, reflecting the fact that early Dutch settlers in the region were mostly interested in trading for furs with Native Americans. When the English took over the territory, their maps were organized in terms of delineating the landed properties suitable for agriculture and the relations of English

and French fortresses. Waterways were shown less as routes for trade than as boundaries.

During the seventeenth century, cartography, in addition to steadily integrating more new geographic knowledge, became a more mathematically based and cooperative discipline, with the gradual acceptance of the Mercator projection as the standard. Mapmaking both within and outside Europe grew more mathematically precise. Galileo Galilei's discovery of the moons of Jupiter provided a basis for rigorous identification of geographical positions and distances. Mapmaking projects grew into larger, often government-sponsored collaborative efforts rather than being projects of individual mapmakers.

■ Introduction: “Guns and Steel”—Military Technology and Conquest

In the early modern period, Europe led—but did not monopolize—a global military transformation sparked by an increase in the use of gunpowder weapons. Gunpowder affected every area of warfare, from the battlefield, where it underlay a rise of infantry at the expense of cavalry; to the siege, where it sparked a transformation of military architecture; to naval battles, in which the ability of ships to fire on one another led to deadlier and far more decisive conflicts.

The rise of battlefield gunnery underlay one of the most important transformations in Eurasian history: the decline of the central Asian horse archer as the master of the Eurasian battlefield. The Ottomans were among the first to demonstrate this transformation as they established

their dominance over the Middle East. Their gunpowder infantry, particularly the famous janissary corps, demolished the steppe-oriented cavalry-dominated forces of the Egyptian Mamluks and Persian Safavids in the early sixteenth century. Gunpowder enabled the partition of the old central Asian nomad heartland between the settled empires of Russia and China in the eighteenth century.

Cannons also transformed siege warfare. The first great siege in which cannons played a central role was the Ottoman conquest of Constantinople in 1453. The huge cannons of the Ottomans were extremely difficult to move. The future lay with more mobile cannons that could effectively accompany an army on the

move. Mobile cannons were first widely used in the French invasion of Italy in 1494. Cannons rendered the high but thin defensive walls of the traditional fortress obsolete overnight. New fortresses with low thick walls were very expensive, often requiring the resources of a government to build. The local warlord was being effectively priced out of the military market. Control over gunpowder weaponry was so essential to government in the early modern Islamic world that Ottoman Turkey, Safavid Persia, and Mughal India are referred to collectively as “gunpowder empires.” Gunpowder helped make the early modern period one of unprecedented political stability throughout much of the Islamic world. But European kingdoms were gunpowder states as well, and the new technologies underlay the strength of centralized monarchies. Even the last group of “northern barbarians” to carry through the “great enterprise” of conquering China, the Manchus, had to acquire and master the use of artillery in order to do so.

Naval warfare moved from the era when weapons fired by individuals on the decks of ships could be decisive—as they were at the Battle of Lepanto in 1571, a victory for Christian gunners over Turkish archers—to one when massive cannons mounted on ships were the decisive weapon, as they were in the English victory over the Spanish Armada in 1588. Another technological transformation with military implications was the increase in long-range shipping. This was related to innovations in both shipbuilding and navigation. Shipping improvements enabled European states to project power on an unprecedented global scale. The combination of the seagoing ship with heavy guns underlay the Portuguese and Dutch empires in the Indian Ocean.

—William E. Burns

Europe's New Warfare in West Asia

The period 1450–1750 was marked by European penetration based on superior naval technology and command of the high seas. It outflanked powerful Ottoman and Persian empires, but European power was mostly restricted to points of support along the coast.

Since the end of the crusades, European forces had been banned from the Asian landmass, and nomads of the steppe invaded Europe. The introduction of gunpowder weapons to Europe altered this, and European knowledge was widely sought after. German and Hungarian gunners helped the Turks in the siege of Constantinople in 1453. Venetians tried unsuccessfully to persuade the Aqquyunlu of Persia to deploy gunpowder weapons against the Turks in 1472. The Portuguese and Russians provided Persians with the cannons to fight the Uzbeks, and Europeans also served as gun makers and gunners in several Asian armies from the sixteenth century on.

European ship construction made quantum leaps during the fifteenth and sixteenth centuries, introducing new hull constructions, multiple gun decks, and complex riggings as well as navigational instruments, which gave European naval power greater range and punch. Portuguese navigator Vasco da Gama arrived in the Indian Ocean in 1498, but the object of European penetration of the period was trade, not territorial conquest or migration. Actual physical control was limited to the coastal areas from a few fortified positions. The Portuguese pioneered this process, acquiring bases as far east as Nagasaki (1570), but beyond the Malacca Strait they could wield little military power.

Opponents in regions of political fragmentation, such as the coastal areas of the Indian subcontinent and the Philippines, were easily defeated by the Portuguese and Spanish, respectively. Consolidated powers like several Indonesian sultanates and the Ottomans, however, could still match them in coastal waters with their galleys. Foes like the Egyptian Mamelukes and Ottoman Turks contested the strategic access of the Europeans to the Persian Gulf and the Red Sea. A Portuguese base at Ormuz by the head of the Persian Gulf, established in 1507, had to be recaptured seven years later. Portuguese attempts on Aden in 1513 and 1517 were repulsed. And unlike the Americas, Asian opposition to European presence on land also deployed firearms and body armor of metal. Purpose-built Dutch, French, and English warships, however, furthered the European naval lead in the following century.

At the turn of the seventeenth century the Portuguese empire fell into decline because of

➤ ALBUQUERQUE ON THE BATTLE OF HORMUZ, *COMMENTARIES*, 1557

After attacking a number of cities on the coast of East Africa in 1556, Afonso d'Albuquerque sailed on to the island of Hormuz and arrived on September 25, 1557. Even though Albuquerque's opponents at Hormuz were armed with ships and artillery comparable to that of the Portuguese, Albuquerque was still able to defeat them and gain possession of the island for the Portuguese. The following is an excerpt from the chronicle describing the battle:

“As some days had elapsed since the king [of Hormuz] had received certain information of our fleet, and the destruction which the great Afonso Dalboquerque had wrought in all the places along the coast, he began to prepare himself to fight with him. For this end he gave orders to detain all the ships that came into the port of Ormuz [Hormuz], and added a force of sixty great vessels, into which he draughted off many soldiers and much artillery, with everything that was required for the undertaking. And among these great vessels there was one belonging to the King of Cambaya, called the Meri, of about one thousand tons burden, with many men and guns, and well equipped for its own defence; and another of the Prince of Cambaya, of six hundred tons, so well appointed that it required nothing from the king's magazine. And besides these ships there were in the harbour about two hundred galleons, which are long ships with many oars, but not very large, and they are armed with two large mortars in the prow, and packed with

cotton bales, so high that the rowers are hidden from sight.” (p. 105)

“When morning broke, and Afonso Dalboquerque plainly saw that no message from the king [of Hormuz] was forthcoming, and that this delay meant war and not peace, he ordered a broadside to be fired. The bombardiers took aim so that with the first two shots they fired they sent two large ships which were in front of them, with all their men, to the bottom—one being the Prince of Cambaya's, the other that of Meliquiaz of Diu. Afonso Lopez da Costa, who was stationed on the land side, vanquished and sent to the bottom some portion of the galleons and atalaia's which his artillery could reach. Manuel Telez, after having caused great slaughter upon some vessels, gave orders to let go a cable, which was laid out to the sea, and ran into a large vessel which lay close to him, and killed a part of the men in it, while the rest threw themselves into the sea, and those who were heavy-armed went down at once.” (pp. 112–113)

a union with Spain and competition with the Dutch. Once allies, the Dutch were now the enemies of the Portuguese due to their own rebellion with Spain, beginning in the 1580s. The first Dutch expedition set sail in 1596, and the Dutch East India Company was established in 1602 with authority to conduct war on behalf of the Dutch republic. Though its main base was located at Jakarta on Java, this new leading world maritime power would assert itself around the rim of the Indian Ocean and in the Mediterranean. The Portuguese were driven from Sri Lanka, Ambon, and the Malabar Coast, but the many wars with France and England in the 1670s weakened the Dutch

position in Asia, especially in the face of growing English power.

From the seventeenth century, inter-European struggles entered into a symbiosis with those along the coast of the Indian Ocean. Local forces were mobilized against rivaling Europeans, but just as often European power could be exploited by Asian princes. For example, in 1622 the Safavids of Persia took the Portuguese base of Ormuz with English help, and the Turks received Portuguese assistance against the Safavids in 1624. Even when the European coastal strong points were safe, they still relied on cordial relations with local powers that controlled the hinterland in order to trade.

The sultanate of Oman also rose to rival European maritime supremacy. In 1650 its forces captured the Portuguese base at Muscat with European ships in the port, and assistance from Dutch and English navigators, administrators, and gunners was acquired. They attacked Portuguese positions at Mumbai (1661–1662), Bassein (1674), and Diu (1676), but their main efforts were directed toward eastern Africa, and the Omani left no lasting impressions on the division of power in India.

In the eighteenth century France and Britain were the main European contenders for power in India. Northern parts of the subcontinent were still held by the mighty Mughals, but India was under heavy pressure from Safavids in the east, Afghans in the north, and Maratha in the south. The latter would rise to be the main opponent of the Europeans as the Mughals fell into decline. Asians found it increasingly difficult to implement new techniques of casting iron guns, flintlock muskets, grapeshot, and bayonets as well as drills and tactics, which were opened up for wider European control. In the Seven Years' War (1756–1763) the British gained the upper hand in the contest for India. The French enjoyed a short renaissance during the American Revolution (1775–1783) but were finally banished during the Napoleonic Wars (1803–1815).

Tools for Gunpowder Empires

During the fifteenth century Europeans began to explore the outside world. They possessed a number of advantages over most of the peoples they encountered. One was the drive to discover new lands and exploit the economic benefits they offered. Another was the development and

integration of naval technologies that led them to undertake long voyages, such as fore and aft rigging and magnetic compasses. The third was the development of military technologies that offered significant advantages over the peoples they encountered. The most important of these military advantages was the use of gunpowder weapons. Although Europeans were not the first to use gunpowder, the ways in which they used these weapons allowed small numbers to defeat the indigenous peoples. Whether it was relying on cannon on board ships to pummel opponents or disciplined volleys by muskets on land, European firearms provided the tools to build empires.

The first use of gunpowder for weapons throwing projectiles comes from China. Gunpowder had been developed in China by 950 CE, but it was apparently first used in fireworks displays and in fire lances designed to burn opposing soldiers. Early guns are recorded in Europe in 1326. Few historians doubt that the technology made its way remarkably fast from Asia to Europe, perhaps with the Mongol conquerors. Small hand cannon were used by individuals, while large weapons that threw heavy stone balls were developed for use against walls. Early siege cannon, such as the ones used against Constantinople by the Ottomans in 1453, were very heavy and were hard to move from place to place. They were rarely used in battles in the field between mobile armies.

By the sixteenth century many soldiers were armed with the harquebus. This was a heavy smoothbore matchlock weapon. It did not replace the pike and other edged weapons but instead supplemented them. Because the smoothbore weapons were very inaccurate, military commanders recognized that they needed to be used in large numbers, firing on the same target. Groups of soldiers, organized into ranks, could fire at a target, and hopefully some would hit it. Pikemen had to protect the harquebusiers after they fired, since they would be defenseless.

The first European conquerors used firearms against the native people they encountered. For peoples such as the Aztecs, the first experience could be terrifying. The large amount of smoke and noise from a firearm had a psychological impact on Native Americans. Spanish conquerors

GUNPOWDER IN THE TURKIC EMPIRES IN THE 16TH CENTURY

combined this with more mobile cannon. When Cortes laid siege to Tenochtitlan in 1521, he used his harquebus and cannon to wear down the defenders.

The European use of firearms proved decisive in the Americas and in Africa to establish empires. Because nearly all natives had never seen firearms, they provided a decisive psychological advantage. Native rulers soon tried to obtain their own firearms or to hire European soldiers against their enemies. In the Congo, for example, King Afonso I accepted Christianity and adopted European ways in 1506 in order to maintain good relations with Portuguese traders. Portuguese soldiers with firearms helped maintain his kingdom against invaders until finally establishing their own territory. In North America the Iroquois and other tribes in present-day New England and Canada were most anxious to obtain firearms for themselves. European traders refused to trade firearms since they realized that the weapons provided their most important

advantage. In the late seventeenth century, however, the Dutch provided some guns to the Mohawks. To provide protection to their own client tribes, the English and French began to trade firearms for beaver furs. By 1700 most of the eastern tribes were armed with many firearms.

While native peoples became familiar with hand weapons, European ships armed with cannon were able to control the seas and help establish empires. No native people were able to match the size and power of European ships, giving the invaders an advantage in coastal regions.

The matchlock was cheap but also unreliable. During the seventeenth century it was gradually replaced by the flintlock. The harquebus was replaced by a lighter musket, weighing around 10–12 pounds (4.5–5.4 kilograms). Because European settlers needed dependable weapons, flintlocks replaced matchlocks more rapidly in the colonies than in Europe. A higher ratio of firearms to settlers existed in the colonies than in Europe. Trade muskets intended

THE MATCHLOCK HARQUEBUS

A soldier fires a matchlock harquebus. Note that he uses a rest to hold the heavy weapon steady. When a lit match is touched to the gunpowder in a priming pan, the charge inside the barrel fires a projectile. The soldier carries individual charges on a bandolier around his chest. These were usually small wooden tubes with a musket ball and powder charge already measured out.

—Timothy J. Watts

(North Wind Picture Archives)

for the fur trade were also produced in Europe. These had shorter barrels, making them more useful in the forest, and were not as well made as most other firearms. By the 1700s firearms were common among Native Americans and other native peoples. They were able to devise tactics to overcome European firearms and to fight on more even terms. What they could not do was overcome the European superiority in logistics and organization.

In the Wake of the Caravel—Innovations in the Brig, Schooner, and Sloop

During the fifteenth century, European shipbuilders combined the advanced characteristics of the ships built in Mediterranean and Baltic shipyards. As a result, they created oceangoing ships that were capable of exploring the world, opening trade with non-Western ports, and creating European empires.

The most important vessels of the Middle Ages had been shallow draft galleys, propelled by oar and sail, suited for the relatively calm waters of the Mediterranean, and used in both naval and commercial fleets. By the 1300s, innovations in shipbuilding and design introduced stronger, more capable vessels. In the Mediterranean the round ship was constructed around a wooden skeleton, following a carefully drafted plan. Shipwrights then nailed planks to this frame, laying the edges flush against each other. The round ship was generally a two-masted vessel, with some having three masts after 1400. The masts carried triangular lateen sails, adopted from Arab vessels called *dhows*. Quarter-mounted rudders or steering oars allowed steersmen to navigate holding a tiller.

In the Baltic, shipbuilders developed the clunky cog. Unlike the keel-mounted Mediterranean round ship whose structure offered greater stability, the cog was built on a flat plank. The design gave it a capacious hold that accepted larger cargoes and allowed it to be run upon beaches so that cargo could be loaded almost anywhere, but it was made for a rolling wet voyage. The hull was built by eye, without a standard plan and without a skeleton. In its clinker-built design, overlapping boards formed the hull. The single-masted cog sported a square sail, which could be worked by fewer men than a lateen rig but was less efficient in propelling the ship. A tiller—essentially the same system used on ships today—attached like a hinge at the center of the stern to work the

ship's rudder. Somewhat more seaworthy than its Mediterranean counterparts, cogs were relatively small, averaging about 75 feet (23 meters) long.

Although crusading armies from northern Europe had traveled aboard Mediterranean ships to the Holy Land from the eleventh through the thirteenth centuries, this form of vessel did not appear in Atlantic waters until the 1400s. At that time, shipwrights in Germany and Holland began to experiment with building the skeleton of a ship first. The process was cheaper and resulted in more standardized ships. It also allowed for a stronger ship. Stronger ships were important because of the more turbulent Atlantic Ocean and also because of the growing recognition that ships needed to carry cannons at sea. By the 1440s, caravels appeared. Like Mediterranean ships, they had three masts and a skeleton. Like Baltic ships, they had flat bottoms and hinged rudders. Most caravels carried square sails on the first two masts and a lateen sail on the mizzenmast. They ranged in size from 60 to 200 tons and were about 65 to 80 feet (20–25 meters) long. Caravels were intended mostly to carry cargo, but they could carry a few cannons. They were also better sailers than most other ships. Caravels were often used for fishing in the North Sea because they were so seaworthy. Two of Columbus's ships were caravels, and most other early explorers used caravels.

At nearly the same time, the carrack appeared as commercial shippers and as warships. Its design resembled the caravel and carried the same arrangement of sails but was larger, some as large as 2,000 tons, and had a bowsprit for additional power. At the bow and stern, upper decks supported castles, protective perches from which its warriors could hurl weapons down at boarders. The carrack was less seaworthy than the caravel, however, because the castles caught the wind, and the carrack thus tended to drift downwind.

Some shipbuilders realized that larger ships were not as fast or handy as smaller ones. The English shipbuilder and admiral Sir John Hawkins (1532–1588), noted for building the ships that defeated the Spanish Armada in 1588, experimented with the carrack design. He found that reducing the size of the castles and increasing the ratio of length to beam (width) to 3:1 or more made a faster ship. The result was the

Watercolor of sixteenth-century caravels by Rafael Monleón y Torres, Museo Naval Madrid. The caravel was the culmination of the blending of characteristics of Baltic and Mediterranean ships. Its improved sailing abilities and endurance made the voyages of discovery during the fifteenth and sixteenth centuries possible. (The Art Archive/Museo Naval Madrid/Gianni Dagli Orti)

galleon, primarily a warship that could outmaneuver and outfight caravels and carracks and carried most of its armament on a gun deck.

The galleon was adopted by other European nations almost immediately. The most important warships of the Spanish Armada and the opposing English fleet were galleons. By 1600 the galleon had successfully married the best characteristics of the Mediterranean and Baltic styles, resulting in a European warship that could dominate those produced by any other region around the world.

The New Warfare—Gunpowder, Artillery, and Muskets

The development of firearms would contribute to a shift in the global distribution of power in favor of European states and states with a

► BATTLE OF PLASSEY, 1757

After longstanding disputes with the British East India Company, the nawab of Bengal sacked Calcutta on June 26, 1756. A force of 900 European soldiers and 1,500 sepoys under Lieutenant Colonel Robert Clive was dispatched from Madras to retake Calcutta, which they accomplished on January 2. The outbreak of the Seven Years' War (1756–1763) ensured French support for the nawab and renewed hostilities in March. The British decided to remove him from power and had no problems finding rivals to support them, most notably Mir Jafar Ali Khan, the inspector general of the nawab's army.

On March 23 Clive's force woke up to the news that the 50,000-man-strong French-supported forces of the nawab were approaching their camp outside Palashi (Plassey). Heavily outnumbered, the British enjoyed the cover of the embankments surrounding a mango grove and were able to withstand artillery bombardment and stop cavalry charges with deadly grapeshot from their own cannons. Also, large parts of the nawab's army were bribed to not fight at their best. When a rainstorm broke out the British troops covered their supplies with tarpaulins, while the gunpowder of their opponent became soaked and useless.

Around noon Mir Jafar convinced the confused nawab that the British were withdrawing, and the Bengal army was ordered back to its camp, only to be pursued by the enemy and bombarded from positions on an overlooking hill. The camp was stormed around 5:00 p.m., and the battle developed into a rout. The outcome marked a turning point in the inter-European struggle for supremacy in India and ushered in the British Raj (1858–1948).

—*Frode Lindgjerdet*

population of European descent. Military use of gunpowder made from charcoal, saltpeter, and sulfur dates at least back to the Chinese Song dynasty (960–1279 CE). Filled into ceramic or metal containers known as Zhen Tian Lei, these crude explosives were either thrown by hand or launched by catapult. Such devices have been excavated with the remnants of the Mongol fleet that attempted to invade Japan in 1274 and 1281. Gunpowder-based rockets and flamethrowers appeared in the twelfth century.

In the thirteenth century Mongol invaders also brought gunpowder to Europe.

Early artillery guns were heavy and cumbersome to deploy and were mostly used in siege warfare. Projectiles were usually solid balls of iron, lead, stone, or even arrows. Explosive grenades had probably been fired from Chinese guns in the fourteenth century but did not appear in Europe until the mid-sixteenth century. In the eighteenth century, grapeshot (lead or iron pellets) fired from ordinary cannon proved far more deadly in close quarters against infantry and cavalry than the medieval ribaldequin and other primitive multishot weapons. In the sixteenth century, cast bronze cannons emerged. They were safer to use and cracked rather than fragmented like iron guns. Lighter and easier to maneuver, they could also be deployed more successfully in field battles. Trunnions, introduced in the early eighteenth century, greatly improved the speed of aiming, and the Cronsted system of casting from 1725 produced cheap, reliable iron guns.

Early handguns were miniature cannons mounted at the end of a stock. They too were heavy and were mostly used when defending a fixed position rather than by moving infantry. In the fifteenth century the harquebus appeared, and the matchlock greatly improved the aiming process. The wheel lock appeared around the same time, but its mechanisms were too delicate and expensive to allow it to be used in any great numbers in war.

The flintlock musket was an improvement in safety, accuracy, and loading time. It was issued to European armies in the latter half of the seventeenth century and remained a standard infantry weapon until the percussion cap (invented in 1805) and the breechloader made it obsolete around the time of the American Civil War (1861–1865). At the end of the seventeenth century the bayonet made musketeer formations independent of the pike men, usually deployed between the musketeers to offer protection during loading. First the plug bayonet was fitted directly into the muzzle, but more practical socket bayonets soon replaced it. Bayonets also encouraged more aggressive infantry tactics.

The emergence of firearms contributed to a wide range of social and military change.

Together with the English longbow, the pike, and the modern state, firearms made heavy cavalry obsolete and helped bring down feudalism as a political system in Europe. Fortifications also changed from an emphasis on high towers and walls to low bulwarks several yards thick constructed to withstand bombardment from heavy siege guns. The culmination of these developments was the advent of star-shaped and bastioned fortresses in the late seventeenth century that called for a remaking of many European cities toward more regular and rectangular street patterns to ease military domination from these fortresses. Printing and literacy enabled not only the organization and maneuvering of multiple columns on the field of battle but also the training of large formations with standardized drills, the latter reaching the peak of perfection in the mid-eighteenth century.

Europeans were not the first to employ firearms, nor did they enjoy monopoly of their use, but they took the lead in their development from about 1450. Non-Europeans kept pace until about the mid-eighteenth century, but this was often done through assistance from European officers, gunners, and gun makers. The ratio of guns to troops remained low with these forces, and non-European armies often failed to center their tactics on firepower or to adapt sufficient logistical systems. The European edge has usually been attributed to constant competition and war between the European states, but the emergence of the modern scientific method was also a contributing factor. This edge was first evident on the high seas, where sealable gunwales and more stable construction enabled an increase in the number of onboard artillery pieces by the mid-fifteenth century. The development of firearms also ended the threat from nomadic peoples of Eurasia against sedentary states.

Fortresses Design in Europe and Asia

The need to defend against Turks in the Mediterranean as well as to protect trade routes and outposts across Asia and the New World ensured the continued building of fortifications by Europeans throughout the early modern era (1500–1750 CE). To deal with continued innovations and improvement to artillery, fortresses and castles in early modern Europe adapted new architectural features to improve both their defensive utility against cannon and the offensive capabilities that such artillery offered. These new features appeared first in Italy, where Charles VIII (1470–1498) of France had demonstrated how devastatingly effective cannon could be when aimed at medieval castles and forts and how very vulnerable to cannon those older forts were. The new style, called *trace italienne*, appeared squat and bulky when compared to its medieval predecessors but was far superior in its ability to withstand artillery attack.

The newer style eliminated the tall towers, machicolations, and thinner walls of medieval fortress design. Towers were both vulnerable to cannon fire and poor platforms for defensive artillery; machicolations splintered into deadly shrapnel when hit with cannonballs, and when cannon pounded the base of curtain walls or towers, the walls collapsed. Walls in the *trace italienne* style were lowered and thickened dramatically, with long sloping faces along the curtains to deflect cannon fire. Lower walls were less dangerous for defenders than were tall towers and when combined with broad stable platforms created ideal bases for defensive artillery. Perhaps the most important innovation, and the one responsible for the distinctive star shape of these early modern fortresses, was the angle bastion. These projected out from along the curtain walls, preventing any blind spots and protecting against oncoming siege batteries. By placing these angle bastions at intervals around the fortress, artillery could both protect the walls and subject an advancing enemy to cross fire. Ditches also became an important element of these new fortresses, offering both additional protection for defensive artillery and an obstacle to oncoming infantry.

In its most basic form, a temporary but effective bastion-and-rampart style fort could be erected relatively quickly using earth and turf, reinforced by rough timbers and shielding defenders from fire with wicker baskets filled with dirt, much like modern sandbags. But these fortifications, while of great short-term utility, were not generally maintained in times of peace and thus needed refurbishing or rebuilding each time their use was required. Permanent fortifications were always at the ready and in areas vulnerable to attack in the heated political environment of the sixteenth and seventeenth centuries were the best way to ensure that a territory or town was not vulnerable.

While the proliferation of new military literature ensured that the defensive superiority of these innovations was widely known, actual adaptation was slow mainly due to the sheer expense of new building. Modification of older fortifications by lowering towers, thickening the walls, and building gun platforms was often a lower-cost alternative. Nonetheless, this new style of fortress building was common by the seventeenth century throughout Italy, France, Germany, and the Low Countries and continued to spread across the rest of Europe, the New World, and Africa.

Wherever Europeans traveled in the early modern world, they took their artillery and fortress designs with them. While the actual structures were often determined as much by the local landscape, materials, and available labor, the purpose of these structures was still the maintenance of a defensible position from attackers with artillery.

The trace italienne was *the* acknowledged superior design for fortresses during the early modern era, but in practice it was not always the best for factory forts that sprang up along the shipping routes utilized by European traders and merchant vessels. Colonial fortifications were mainly outposts for trading and refitting ships and varied greatly in their design based on their location. If the colonial outposts were of particular importance, building materials would be shipped from Europe to ensure their strength and defensive utility, but more often they were only a four-bastioned rectangular structure built of local materials, essentially just defensible compounds.

Although improved artillery was a feature of warfare that spread throughout the world, fortifications in Asia did not see the same trend toward architectural innovation that was so distinctive in Europe. Turkish castles built as late as the mid-seventeenth century followed the medieval pattern of square walls with round towers at the corners, with a nod to the defensive importance of artillery by adding rows of casements along the bases of both towers and curtain walls. In India, native fortresses did not change significantly until the mid-eighteenth century, when the British East India Company ruled the subcontinent. Until that time, the fortifications more closely resembled the medieval European fortresses with machicolated ramparts, towers, and tall walls pierced with loopholes. In China, traditional fortified towns surrounded by towering pounded-clay walls faced with brick, as thick as 40 feet (12 meters) at the base and up to 60 feet (18 meters) high, continued to be the standard in defensive architecture. These *ch'eng* were a central feature of Chinese government and economy, and the ramparts, carefully spaced towers, and gateway structures in the center of each side that served dual purposes as barracks and citadels ensured that they were always ready for defense as well.

In Southeast Asia, while stone fortresses did exist in the sixteenth and seventeenth centuries, they were relatively rare. Bricks and mud were the preferred materials of indigenous peoples; a noted contrast was the proliferation of stone forts built throughout the region by the Portuguese and Spanish during the same time period. The Europeans who observed these structures were amazed by the strength and durability of the bricks made throughout Southeast Asia and declared them to be far superior to those in the West. These brick forts, during times of attack, were often augmented by makeshift timber stockades. In addition to these kinds of structures, permanent wooden fortifications were also common. In Siam, fortified cities were protected by masonry walls backed with earth, surrounded by massive stockades of teak. Even though firearms had arrived with the Europeans, their adoption in Southeast Asia was not uniform. Where gunpowder weapons were adopted, fortress designs were modified by

creating loopholes for musketeers, thickening the walls, and making strategic use of ditches.

Western Maritime Technologies as Tools of Empire

Crucial factors in the development of sea-going navigation included: the use of the magnetic compass for direction-finding; recording distance traveled on a portolan chart; the invention of the caravel furnished with a big rudder, three masts and more sails; and improvements in casks to store provisions. Christopher Columbus’s arrival in the New World in 1492 and Vasco Da Gama’s journey to India in 1498 would have been unthinkable without these maritime technologies, which permitted the Spanish, Portuguese, Dutch, English and French to occupy vast territories in the Americas and to establish routes and commercial enclaves in Asia and Africa from the late fifteenth century onwards. Nevertheless, the use of these technologies did not come automatically to Europe. On the contrary, over the last four decades scholars have reconsidered the historical context in which they were developed and used. Consequently a more precise image has emerged of the different types of techniques that were used, the cumulative and practical character of technological improvements, the institutional context in which

these changes occurred, and the crucial cross-cultural relations on which European maritime expansion was progressively founded.

The maritime technologies mentioned above, such as the magnetic compass, did not develop overnight; earlier versions had developed in China, and the technologies Europeans relied on in the fifteenth century were the result of progressive innovations first by Catalan, Venetian, and Genoese sailors in the Mediterranean Sea from the thirteenth century, and then innovations introduced by the Portuguese and Spanish in the fourteenth and fifteenth centuries in the conquest of the Atlantic archipelagoes such as the Canaries, Madeira, and the Azores. Other technologies used by the Europeans in the conquest and settling of the Americas also trace their roots to the thirteenth century. These include the organization of the slave plantation and sugar cane production, the development of financial mechanisms, ethnographic description of peoples outside of Europe, the recording of geographical characteristics of territories occupied or conquered, and the development of firearms as well as the tactics of war and the art of fortification, etc.

Sea-going navigation had a pronounced practical character. This condition was not eliminated by the use of the compass and portolan chart. Sailors and navigators were experts at finding the Pole Star to establish north and at recognizing wind patterns in order to prevent shipwrecks. In fact, the empirical knowledge possessed by experienced sailors and navigators competed with the theoretical knowledge developed by cosmographers well into the eighteenth century, when more precise instruments like the sextant and the chronometer were invented. This interplay between practical and theoretical knowledge is a key element in the development of the technologies of navigation used by the Europeans in the construction and maintenance of their colonial empires from the sixteenth to eighteenth centuries.

Institutions for recording, conserving, and creating geographical information also aided the advance of maritime capabilities. Every trip to overseas territories produced information related to new geographical discoveries or astronomical observations, or further cartographic evidence about existing territories provided by indigenous

people, etc. Consequently, every time a ship returned to Europe from Africa, Asia, or the Americas it brought not only gold, silver, or spices but also new and more precise data. The Europeans knew the value of these data, and created specialized institutions to record, conserve and protect them. In these institutions the information was inventoried and transformed into secret geographical information in order to support political aims. For instance, the House of Trade founded in 1503 by Isabel of Castile produced maps to use as evidence of Spanish sovereignty in their territorial disputes with other European powers.

The maritime technologies used by Europeans during the sixteenth, seventeenth, and eighteenth centuries, despite their modest and unsophisticated appearance, were key tools in the process of empire construction. They were in fact progressively incorporated in the institutional structures developed by the imperial powers from the sixteenth century onwards. The importance of these technologies was related to the enormous maritime distances that had to be covered to connect Europe with its overseas territories. Consequently, they served four purposes: first, safer navigation; second, the accumulation and exploitation of astronomical, geographical and cartographic data; third, the creation of inventories and maps of territories discovered and conquered; and finally, the support of elaborate (and problematic) scientific arguments demonstrating Europeans' right to possess non-European territories.

Military Technologies on the Habsburg-Ottoman Frontier during the Sixteenth and Seventeenth Centuries

For 200 years, the Habsburg-Ottoman frontier was the site of nearly constant low-level conflict between the two empires. Periods between declared wars were marked by cross-border raids by irregular forces on both sides. Local units adopted firearms as their main weapons, along with guerrilla tactics that stressed stealth, individual initiative, and ruthlessness. The border itself was marked by fortifications that ranged from cutting-edge architecture to primitive fortifications that provided forward-operating bases for raiding units over the longest frontier of the time in Europe.

In the early sixteenth century, the Ottomans continued their expansion against the ineffective state of Hungary. In 1521 they captured the major fortress of Belgrade. Five years later the Battle of Mohacs destroyed Hungary's ruling dynasty and armed forces. Most of Hungary, Croatia, and Slovenia were overrun by the Ottomans, while the Habsburgs took the rest. The border between the two empires was approximately 620 miles (1,000 kilometers) long, stretching from the Adriatic Sea to Transylvania. To stabilize the situation, the Habsburgs hired thousands of mercenaries to secure the border. The cost quickly proved excessive, so they resurrected the Roman practice of military colonies. Groups of Greek Orthodox refugees, along with Serbs and Croats, were settled along the frontier. In return for land, religious freedom, and exemption from taxes, the settlers promised military service. Only a portion of the local residents served at a time unless Ottoman troops were on the move. The others cared for

the families of those on duty. These settlers developed into a class of military professionals known as *grenzers* (borderers). Approximately 20,000 *grenzers* and mercenaries guarded the long frontier at any one time. The first standing Habsburg army did not come into existence until 1598, when three permanent regiments were organized to serve on the military frontier.

The military frontier became a sort of no-man's land, with virtually no commerce or industry. Unlike other Habsburg territories, a military administration, not a civil government, controlled the frontier zones. Many small fortifications were built to control roads and trails across the border. Over 100 large and medium fortifications were also constructed along major routes. The frontier was divided into six geographical zones, each with a general responsible for maintaining the defenses and controlling the local forces. During the second half of the sixteenth century, Italian architects were hired to design modern fortifications that were intended to mount large numbers of cannons and could withstand artillery fire. The larger fortifications were normally garrisoned by mercenary troops who were trained to fight in the open in large formations. In contrast, the *grenzers* specialized in raiding and individual combat. They learned to take advantage of the terrain to protect themselves and to approach an enemy without being seen. While most European field armies used a combination of pikes and matchlocks, these irregular troops were armed mostly with small-caliber muskets. They specialized in ambushes and never tried to fight in formations.

While most of the Habsburg soldiers were infantry, some groups of cavalry were also raised, particularly in Hungary. These were the hussars, whose name came from the Hungarian term for “20.” In theory, every twentieth man in the frontier districts served in the light cavalry units. They were based upon the Ottoman *sipahi*. Both types of units traveled fast and excelled in scouting and raiding missions. Like their *grenzer* brethren, the hussars earned a reputation for wild attacks, ruthlessness, and bravery. They rarely tried to fight attackers who were better armed but instead retreated and used their mobility to strike when conditions were more favorable.

THE HUSSARS

By 1702, the regular Habsburg army included eight regiments of hussars. Their unique and colorful uniforms made them stand out from other cavalry. The hussar wore a tall fur cap or felt shako, as in this picture. A bag of colored cloth hung down from one side. Light boots, long tight pants, and a tight-fitting tunic known as a dolman were always worn. The most distinctive article of the hussar uniform was the fur-lined pelisse, or outer jacket. It was normally worn across the back while slung from the shoulders, as in this picture, or with the left arm through the sleeve and the pelisse hanging down to cover the left side of the body.

—Timothy J. Watts

A Hussar on Horseback by Bernardo Bellotto, 1773. (Kunsthistorisches Museum, Vienna, Austria/The Bridgeman Art Library)

The Ottomans adopted similar tactics to defend their side of the border. They constructed fortifications or renovated ones taken from the Hungarians to defend important routes. Local militia forces were recruited and paid for with taxes known as *ocaklik*, paid by non-Muslim residents of the region. Provincial governors served as commanders of the local militia and were responsible for constructing defenses. Like their Christian counterparts, the Muslim militia ordinarily operated as irregulars, using firearms as their main weapons. During a major campaign, however, such as the Ottoman attack on Vienna in 1683, local militia would form a significant part of the invading Muslim army.

Both Christian and Muslim forces engaged in raiding across the border even in times of peace. Because of the length of the frontier, small groups could easily slip across. If they did, defenders would try to track them and intercept them before they could escape with their booty. Both sides regularly looted, burned, and murdered inhabitants on the other side. Prisoners were rarely taken: grenzers and Muslim militia could expect to be killed out of hand.

During the Thirty Years' War (1618–1648), grenzers were hired by the Habsburg rulers to serve in Germany. The grenzers' reputation quickly terrified both friends and foes. By the beginning of the eighteenth century, the irregular infantry and hussars had a considerable impact on other European armies. Their skill in scouting, ambushes, and raids on more regular forces led European generals to form similar light infantry and cavalry units. Until the French Revolution, these specialized units played a role that regular infantry and cavalry could not.

During the late sixteenth century, both armies recognized the need for more soldiers armed with firearms. Although the janissaries had largely abandoned the bow decades before, many Ottoman auxiliary soldiers had retained their traditional weapons. In contrast, Habsburg infantry followed the Spanish example of increased numbers of soldiers with matchlocks mixed with pikemen. Habsburg formations evolved from rectangular blocks to thinner lines, allowing more soldiers to fire simultaneously. More numbers of soldiers were also recruited by the Habsburgs, creating larger armies. During the Fifteen Years' War (1591–1606), Ottoman commanders gratefully welcomed European deserters trained with firearms from Habsburg armies.

The seventeenth-century development of tactics based on firepower instead of charges to settle a battle with personal weapons favored the Habsburgs. During the second half of the century, Habsburg armies included many veterans of the Thirty Years' War. Habsburg armies also recognized the need for intensive drill and training to successfully carry out these tactics. By the end of the period, Habsburg armies had achieved a significant advantage over their Ottoman opponents.

■ Introduction: Innovations in Medicine

Medicine in the beginning of the early modern period was practiced in a number of learned traditions by physicians conversant with classical texts ranging from Hippocrates in the West to the Yellow Emperor's Classic of Internal Medicine in China. Medicine

was also practiced on a far more empirical and in many cases more effective manner by a legion of healers, bonesetters, and midwives.

Cultural traditions dictated many of the differences between medicine as practiced around the world. The East Asian idea of the body as

dominated by energy flows differed from the Western tradition of examining the body's organs in terms of functionality. However, medical ideas and practices, particularly pharmacology, were able to travel across cultures. The European explorers and conquerors of the New World drew on Native American expertise in the uses of America's healing plants. One of these plants, quinine, became the first successful treatment for malaria, a disease that had stymied European physicians and healers for centuries. European physicians in India consulted with Hindu Ayurvedic practitioners on Indian drugs. Smallpox inoculation reached Europe and colonial America from different routes, including the Islamic Middle East and Africa. By the eighteenth century, European medicine was attracting growing interest among Japanese physicians.

The European medical tradition was the one undergoing the most revolutionary changes in the early modern period. These changes were in part driven by European expansion that led to the introduction of new drugs such as quinine and even tobacco, touted as a wonder cure by many of its promoters in the sixteenth century. However, intellectual developments indigenous to the European tradition also affected medical ideas, particularly in the area of anatomy and physiology. In the fifteenth century European shared with Islamic medicine a common foundation in the works of the classical Greek physicians Hippocrates and Galen and the subsequent Arab writers such as Ibn Sina, known in the West as Avicenna. European medical writers in the Middle Ages had added to the classical tradition but had not fundamentally revised it, and the works of the ancients and Avicenna remained at the core of the European medical curriculum.

In the Renaissance, humanistic researchers in Europe rediscovered a variety of hitherto lost classical medical texts as well as issuing improved editions of the established Greek canon. The revival of classical medicine was followed by innovations in the understanding of the body, most notably the English physician William Harvey's description of the circulation of the blood, generally viewed as the most important innovation in theoretical medicine in the early modern period. The "scientific revolution," with its emphasis on overthrowing ancient authority,

helped discredit the classical medical tradition. New technologies, such as the microscope, also brought new knowledge to physicians. By the eighteenth century the classical tradition had been left behind in most European medical schools, replaced by a variety of medical philosophies. However, advances in medical theory often had little effect on medical practice, and medicine did not grow remarkably more effective in treating disease or prolonging the life span in this period.

—William E. Burns

Medicine—Physiology and Anatomy

The early modern period was marked by radical changes and innovations in the understanding of the human body's structure and processes. In the Middle Ages, the dominant understanding of the body had rested ultimately on the ancient Greek physician Galen (129–ca. 199). Galen's many surviving works, with numerous commentaries and derivative works by Greek, Arab, and Latin physicians, dominated the medical school curriculum. Anatomy was a low-status discipline, often associated with surgeons rather than physicians. The chairs of anatomy established at several universities in the sixteenth century initially had less prestige than the traditional medical chairs. The revival of interest in anatomy among physicians dated from the fifteenth century but really took off with the publication of a Latin translation of Galen's recently discovered *On Anatomical Procedures* in 1531.

The medical schools of northern Italy and particularly the University of Padua in the territory of the Venetian Republic were centers of anatomical research. The lavishly illustrated *Of the Fabric of the Human Body* (1543) by the Flemish Paduan Andreas Vesalius (1514–1564) laid the foundation for subsequent anatomists. Like Galen's anatomical work, which Vesalius had worked with closely as a translator, it was presented in a logical order, from the skeleton outward, as opposed to medieval anatomy texts, which presented their material from the outside in, the order in which a dissector encountered human organs. Vesalius's study revealed that Galen and his ancient colleagues had made many

► THE REDISCOVERY OF THE CLITORIS

Ancient medical writers' awareness of the clitoris had been lost during the Middle Ages. The French physician Charles Estienne (ca.1505–1564) was the first modern anatomist to describe it, in his *Dissection of the Parts of the Human Body* (1545), associating it with urination. His description had no discernible influence, and priority in the “discovery” would be keenly contested by two Italian professors. Gabriel Fallopio described it in a work written around 1550 but not published until 1561, *Observationes anatomicae* (*Anatomical Observations*). Realdo Colombo (1510–1559) took advantage of the gap to claim the discovery in *De Re Anatomica* (1559). Contemporaries generally judged Fallopio as the discoverer, but Colombo innovated by emphasizing the clitoris's role in female sexual pleasure. Despite the publicity given to the priority dispute, it took some time for the difference between the clitoris and the labia to become fully established in the medical literature.

The establishment of the clitoris as a distinct organ of sexual pleasure tremendously affected the way male medical specialists thought about female sexuality, particularly sex between women. Women who penetrated other women were increasingly defined as monstrous, possessing freakishly enlarged clitorises. Surgical removal was recommended, and sometimes practiced, to “cure” this behavior.

—William E. Burns

errors, partly because they had been forbidden to dissect the human body and had to extrapolate from animals. Galen, relying on the evidence of dogs, claimed that the human liver had five lobes when in fact it has none.

Although much subsequent work built on Vesalius, emphasis shifted from his Galenic preoccupation with structure to the function of body parts, a shift inspired by the biological works of Aristotle. Bartolomeo Eustachio (d. 1574), a Roman professor, was one of the first to write anatomical monographs on particular organs and is the namesake of the Eustachian tubes of the ear. Two who followed Vesalius as professors at Padua's medical school were Gabriele Fallopio (1523–1562), the first to describe what became known as the Fallopian tubes, and

Girolamo Fabrici, known as Fabricius of Acquapendente (1533–1619), the first to describe the valves of the veins and the teacher of English physician William Harvey (1578–1657).

The path of the blood through the body was one of the oldest problems in medicine. Galenists thought that venous blood originating in the liver and carried in the veins carried nourishment. The heartbeat powered the movement of some venous blood from the liver to the heart via the vena cava. This blood was combined with air in the heart; it was combined with air to form arterial blood, which carried vitality through the body powered by the pumping of the arteries themselves in synchronization with the heart. The problems for Galenists were how the venous blood crossed from the right ventricle of the heart to the left and how air got from the lungs to the heart. Galen had theorized that venous blood seeped through tiny pores in the wall separating the ventricles, and the pulmonary vein carried air from the lungs to the left ventricle, returning vapors to be exhaled.

Early modern anatomists began to chip away at this picture. Vesalius questioned the pores of the heart and the role of the vena cava. The pugnacious Realdo Colombo (1510–1559), a rival of Vesalius at Padua, described the “lesser” or pulmonary circulation of blood between the heart and lungs in his *De Re Anatomica* (*On Anatomy*), published in 1559. Fabricius argued that the valves kept the body's lower extremities from being flooded with blood. Harvey's *De Motu Cordis* (*Of the Motion of the Heart*), published in 1628, set forth a complete theory whereby all the blood, rather than a portion of it, was transformed from venous to arterial via the pulmonary circulation and whereby the heart, a muscle that acted in the body as a pump more active in contraction than dilation, drove the blood through the system of arteries and veins, a single system centered on the heart rather than Galen's dual heart-liver system. As an Aristotelian, Harvey viewed the heart as more important than the liver, and as an anatomist, he noted the vast quantities of blood that circulated from each heartbeat, far more than the liver could replenish. Harvey's theory was bitterly rejected by Galenists at conservative medical faculties like the University of Paris. However, in the

long run Harvey's theory proved fatal to Galenic physiology, which most medical theorists abandoned by the end of the seventeenth century. The principal circulatory problem that Harvey had left unsolved—how the arterial blood circulated back into the veins as venous blood—was solved by the Bologna professor and pioneering microscopic anatomist Marcello Malpighi's (1628–1694) observation of the capillaries in the lungs of a frog, described in his *De Pulmonibus (On the Lungs)*, published 1661.

The theoretical implications of the circulation were unclear. Harvey himself believed that blood carried a spirit endowing the body with life. However, René Descartes interpreted it in a mechanical way, an interpretation followed by the influential school of iatromechanists (medical mechanists), who extended mechanical interpretation to other physiological processes. Prominent iatromechanists included the scientist Giovanni Borelli (1608–1678), who studied the workings of the muscles; the physician Giorgio Baglivi (1668–1707), who compared the body to a windup mechanical doll; and the Leiden medical professor Herman Boerhaave (1668–1738), perhaps the most influential physician of the eighteenth century. Seventeenth-century anatomy spread well beyond Italy. The Danish scientist Nicholas Steno discovered the duct of the parotid gland, Steno's duct. England's "Oxford Physiologists," including Richard Lower (1631–1691) and John Mayow (1645–1679), carried on Harvey's work, investigating blood circulation and respiration and identifying the redness of blood with its exposure in the lungs to "nitro-aerial" particles in the air. Several investigators studied the glands, a focus of great interest in the late seventeenth century. The English physician Thomas Wharton's (1614–1673) *Adenographia* (1656) was the first complete treatment of the human glandular system.

Medicine—Pharmacology

The European pharmacopeia increased greatly during the early modern period. The rapid increase in the amount of available drugs was driven by changes in medical theory, notably Paracelsianism, and European expansion.

Philip Theophrastus Bombast von Hohenheim, known as Paracelsus (1493–1541), a German-Swiss physician and theologian, was an extremely pugnacious personality who denounced professors and physicians as ignorant and greedy frauds and advocated learning from peasants, women, and unlearned medical practitioners. Paracelsus attacked the dominant medical tradition as inaccurate and useless and advocated direct observation rather than reading old books. Late-sixteenth-century writers turned Paracelsus's chaotic writings into a system, known as Paracelsianism. Paracelsian medical writers denied the traditional theory that the body could be made healthy by balancing its humors and proclaimed chemistry as the foundation for all medicine. Like other alchemy-influenced chemical physicians, they argued that more effective medicines could be created by alchemical refining and distilling of the herbs used by conventional physicians, while many traditional physicians were endorsing "simples," parts of plants used in their basically natural form. Paracelsians were divided on many issues, and university-educated Paracelsians denounced unlearned Paracelsians as unqualified or fraudulent. There were also divisions between those who embraced the magical side of Paracelsus's legacy and those who spurned it. Europe's medical establishment slowly became more tolerant of chemical medicines. Seventeenth-century Paracelsianism lost much of its controversial nature as well as its identity as an independent movement, blending into new systems of chemical medicine and chemical philosophy.

The expansion of the pharmaceutical repertoire continued a trend from the Middle Ages. European apothecaries had long sold drugs from other parts of the world. At the beginning of this

➤ JAN BONTEKOE, THE TEA MAN

The seventeenth-century Dutch chemical physician Jan Bontekoe was the greatest promoter of the health benefits of an Asian wonder drug recently arrived in Europe, tea. (Bontekoe was a strong believer in the medical virtues of exotic substances; he also endorsed chocolate, opium, tobacco, and coffee.) The earliest evidence of widespread tea drinking in Europe comes from the middle of the century. Bontekoe's *Tractat van het Excellensie kruid Thee* (Treatise on the Excellence of Tea, 1678) claimed that tea drinking had cured him of kidney stones and bloody urine. He recommended against drinking strong tea with sugar in favor of numerous cups of weak tea, unsweetened, although a little milk was permissible. Bontekoe recommended as many as 12 cups of tea after dinner and suggested that for tough cases as many as 200 cups a day might be necessary. Bontekoe explained the healthful action of tea by its ability to "thin" blood that had grown thick and cold. Tea was also an alkali, which counteracted harmful acids. He explained tea's helpfulness against dysentery by its ability to counteract damaging acids introduced into the stomach by excessive consumption of fats, vinegar, and wine. He dismissed rumors that tea caused falling sickness, impotence, and barrenness.

—William E. Burns

period Venice was the great drug mart of Europe due to its leading role in Middle Eastern trade, particularly important because much of the pharmaceutical literature was of Arabic origin. The increased ease of transport caused by the Portuguese circumnavigation of Africa in 1498 added to the volume of exotic medicines from India and farther east while eventually marginalizing Venice. Amsterdam would replace it as the great center of exotic drugs by the seventeenth century.

Many new products from Africa, Asia, and the Americas were first promoted as healthful drugs. Powdered Egyptian mummy had a reputation as a cure-all. Tobacco from America was originally promoted in Europe for its alleged health-giving properties. The Americas contributed several new medicines that became very

popular. The Andean tree bark called guaiac, thought to cure the new disease syphilis, was being imported into Europe by the early sixteenth century. The other major American pharmaceutical innovation was the bark of the cinchona plant, introduced by the Jesuits (hence the term "Jesuit's bark") in the early seventeenth century; it was used for the treatment of fevers and was particularly effective against malaria, which plagued the Jesuits and other inhabitants of Rome. Modern quinine is derived from cinchona. In both cases Europeans learned of the medical properties of the substance from the American natives, the usual pattern in exotic pharmacological research. There were also efforts to acclimate foreign medical plants in Europe, often spearheaded by the botanical gardens associated with university medical schools.

Paracelsianism and the increased uses of the new drugs were in many ways opposed movements. A key Paracelsian tenet was that local bodies were best cured by local drugs, although this belief was not restricted to Paracelsians. Another common belief was that diseases were best cured by plants originating from the same area as the disease itself, one reason for the popularity of guaiac as a cure for syphilis, a disease thought to be of American origin itself. Paracelsians and others looked with suspicion on the classical and Arabic pharmacopoeia because its medicines were suited for Mediterranean bodies rather than those from northern European countries where Paracelsianism was strongest. They also frowned upon the new drugs from Asia and the Americas. Much pharmaceutical literature had a strongly nationalistic cast, boasting of the medical superiority of local herbs over foreign spices. Paracelsians and other localist practitioners were the driving force behind much local botany done with the hope of identifying healthful plants.

This new medical knowledge, along with older ideas, was embodied in pharmacopoeias: lists of authorized medicines, the ways to prepare them, and their uses. These pharmacopoeias were usually the creation of state-sponsored physicians or physicians' organizations. The creation and revision of a pharmacopoeia was often keenly contested by physicians and apothecaries of different schools aiming to shape medical practice to their desired end.

The apothecaries, one of the three organized branches of medicine, along with the physicians and surgeons were at the center of changes in pharmacology. Unlike physicians, apothecaries were usually not educated in the medical theory taught in universities, whether Paracelsian or traditional, and learned their craft by apprenticeship. Apothecaries were government regulated and were often treated with suspicion, as it was believed that some dealt in poisons. Apothecaries, like other medical practitioners, quarreled with physicians. Physicians argued that they should regulate the apothecaries' guilds and that apothecaries should be forbidden to give medical advice. Apothecaries claimed that physicians were infringing on the apothecaries' monopoly of drug selling. On the other flank, apothecaries had to defend their monopoly over specifically medical substances from grocers and the wandering vendors of unlicensed medicines known as charlatans. (Italians dominated this profession, hence the spread of the Italian *ciarlatani* into other European languages.) Other herbal practitioners included housewives, expected to make up simple herbal recipes for their families, and wise women in villages. Their practice was much less affected by scientific change than was that of the commercial apothecary, however.

Some apothecaries innovated in chemical medicine; the German alchemist and apothecary Johann Rudolf Glauber (1604–1670) devised several antimony-based medicines. The Society of Apothecaries of London engaged in large-scale medical manufacture with a laboratory and a joint-stock company beginning in 1682. Apothecaries' organizations also ran physic gardens, growing medical plants for commercial use. Like other medical professionals, apothecaries contributed to medical literature by writing on their own professions. Some also accumulated pharmaceutical museums, like the Italian apothecary Francesco Calzolari (1521–1600) whose museum included the unicorn's horns thought to cure poisoning.

Medicine in Islam

Medicine in the early modern Islamic world continued to be based on the classical tradition of the ancient Greeks Hippocrates (fifth century BCE) and Galen (129–210 CE) as carried on, expanded, and reinterpreted by the great medieval Muslim physicians, such as Muhammad Ibn Zakkariya Al Razi (d. ca. 925) and Abu Ali al-Husayn Ibn Sina (980–1037). This medical literature, mostly in Arabic and Persian, was complemented by an emerging literature in Ottoman Turkish and other younger Islamic languages. The Galenist approach was holistic, focused on maintaining or restoring health rather than curing specific diseases. A healthy body was one that balanced the four humors: yellow bile, black bile, phlegm, and blood. Diet was viewed as particularly important for maintaining balance and overall health, and there was an extensive literature drawing from indigenous as well as Greek sources on the health benefits of different foods. Early modern Muslims also viewed health as having an important spiritual dimension in that the health of the body was dependent on the health of the soul. The ideal physician was a “wise man” rather than merely a skilled professional.

In addition to this learned medicine of Greek origin, there was a textual medicine indigenous to Islam, the so-called Medicine of the Prophet. The Medicine of the Prophet was a systematization of Quranic verses and *badith*, or sayings attributed to Islam's founder Muhammad, related to medical issues. The Medicine of the Prophet was the first text studied by many Muslim medical students, but it dealt with a limited range of issues and did not provide a theoretical framework. Commentators on prophetic medicine

➤ JOSEPH DE LA BROSSE, *PHARMACOPEIA PERSICA*

Although the most famous transfer of Islamic medical knowledge to Europe was the introduction of smallpox inoculation in the eighteenth century, there was a long-standing European interest in the drugs to be found in the geographically vast world of Islam. One who revealed Islamic pharmacology to Europeans was the French Discalced Carmelite friar Joseph de la Brosse (1636–1697), also known by the name he adopted on entering the order, Ange de Saint Joseph. De la Brosse spent many years in the Persian and Ottoman empires, serving as prior of his order in the Persian cities of Ispahan and Basra. After his recall to Rome in 1679, his Latin *Pharmacopeia Persica* was published in Paris in 1681. It was largely based on an earlier work by Persian physician Mozaffar ibn Mohammad Hosayni Sefai (d. 1556). In addition to discussing remedies derived from plants, *Pharmacopeia Persica* also contains the first European medical description of trehala, an edible substance derived from the cocoons of a species of Middle Eastern beetles and used to treat coughs and pulmonary diseases. De la Brosse also published a Persian grammar, *Gazophylacium lingua Persarum* (1684).

—William E. Burns

such as the Egyptian scholar Jalal al-Din al-Suyuti (d. 1505), author of *The Proper Road and the Thirst-Quenching Spring of Prophetic Medicine*, often used a Galenic framework to present prophetic medical injunctions. Suyuti's commentary was widely distributed through the Islamic world as far as India. Shia Muslims also employed the Medicine of the Prophet but supplemented it with the medical sayings of the early Shia imams. The Safavid Shia theologian Muhammad Baqir al-Majlisi (d. 1698) wrote a voluminous commentary on prophetic medicine that incorporated several Greek ideas as well.

The influence of Western-learned medicine on Islamic medicine was still weak in this period and was mostly found in the Ottoman empire, the Islamic society with the closest connection to the West. Like the Europeans, sixteenth-century Islamic physicians faced the challenge of the “new disease” of syphilis. The first treatise on the subject from a Muslim physician dates from 1569.

The author was Imad al-Din Mas'ud Shirazi, a physician at the hospital in the Persian city of Mashhad. Shirazi recommended a plant called China root as a treatment for the disease, the same remedy recommended by many European authorities. The new medicine of German physician Paracelsus (1493–1541) and his disciples influenced Ottoman medicine through the work of Salih ibn Nasrullah (d. 1669) and subsequent practitioners of “chemical medicine” or “new medicine.” Ottoman Paracelsians, however, did not always clearly distinguish between the new chemical medicine and the old humoral medicine. In 1768 an Ottoman court physician, Subhi-Zade ‘Abd al-Aziz, made two translations of treatises by Dutch medical mechanist Herman Boerhaave (1668–1738) at the behest of Sultan Mustafa III. Like the earlier Ottoman Paracelsians, the sultan's physician tried to integrate the new ideas with the tradition of Galenic humoral medicine.

Learned medicine was complemented by a variety of folkloristic medical beliefs, such as the inoculation for smallpox. Many Muslims and their Christian, Jewish, and Zoroastrian neighbors believed that disease could be caused by the evil eye or by wicked spirits. There were many religious practices recommended for the sick person. These beliefs are even found in learned texts such as al-Suyuti's. Physicians were outnumbered by a range of “unlearned” medical professionals, including surgeons, midwives, and circumcisers. Surgeons mostly dealt with external problems such as wounds, boils, and abscesses. They were considered practitioners of a craft rather than “wise men” like the physician, and the Islamic literature in surgery is tiny compared to the voluminous literature aimed at physicians.

Although Ottoman sultan Suleiman I (r. 1520–1566) founded a medical madrasa as part of Istanbul's Suleimaniye complex, which he hoped to make the intellectual center of the empire, the training of physicians in the Islamic world remained based on an informal system of apprenticeship or training in hospitals. The profession of physician was often passed down from father to son. Physicians and surgeons were becoming increasingly professionalized in this period. The Ottoman state was a major employer of physicians and surgeons, both in the court hierarchy and in the military. The sultan's

head physician, who was usually recruited from those with expertise in both medicine and Islamic law, was regarded as the head of the medical profession in the empire.

Hospitals remained functioning throughout the early modern period. Hospitals were founded by Islamic rulers and the very wealthy as acts of charity, one of the duties of Islam. They were supported by waqfs (religious endowments) that provided a dedicated income stream enabling some to last for centuries. Great medieval hospitals like Cairo's al-Mansur, founded in 1284 by the Mamluk sultan Qalawun, survived the entire early modern period and were joined by new hospitals founded by early modern Islamic rulers such as the hospital in Edirne founded by Ottoman sultan Bayezid II (r. 1481–1512). Hospital foundations were seriously declining by the eighteenth century, however. Hospitals had an educational function, providing a place for young physicians to be trained. Although dissection was strictly forbidden in Islam, the hospital provided a place for physicians to gain clinical experience. Some hospitals included lecture rooms and libraries, very important since medical education revolved around mastering the classical medical texts. Islamic communities also included mental hospitals. However, most hospitals were located in cities when Islamic society was predominantly rural, and the number of hospitals was small in relation to the overall population. Hospital care for the physically and mentally sick never became the norm in early modern Islamic society.

Medicine in Mesoamerica

Like other aspects of the culture of the people of the valley of Mexico before the Spanish conquest in the early sixteenth century, much of their medical knowledge has been lost. However,

medicine, particularly pharmacology, was one of the areas of native knowledge that Europeans had the most interest in, and there are several texts and documents preserved on the subject. Distinguishing between genuine indigenous medicine and European influences in postconquest documents remains a challenge for scholars.

Mesoamericans were a relatively healthy population by premodern standards, as they had less vulnerability to famine and epidemic diseases than similar Old World peoples. However, they faced other diseases such as rheumatism, gout, gastrointestinal and respiratory infections, sexually transmitted diseases, and many other medical problems.

The dominant people of Mexico in the late fifteenth century, the Mexica, or Aztecs, viewed the body as a microcosm of the universe, with the heart playing the role of the sun, the diaphragm the earth, and the skull the vault of heaven. Organs played similar functions in the microcosm as their complements did in the macrocosm; the heart gave heat to the body as the sun gave heat to the earth. The genital and anal openings of the lower body and the souls of the feet connected the body to the underworld. A healthy body was conceived as one where all organs were working together harmoniously. A body in which one organ was out of balance was unhealthy.

Mesoamericans also saw the universe as spiritual and associated the body and specific organs within it with spirits. A spiritual entity called *tonalli* endowed the body with life, entering it at the moment of conception and dwelling in the top of the head. Hair was viewed as protection for the tonalli, and some grew their hair long when facing a particular danger, cutting it when the danger was over. Men, but not women, could also lose tonalli through excessive sexual intercourse. Children were particularly vulnerable to the loss of tonalli before the closing of their skulls. Tonalli could temporarily leave the body during sex, sleep, or a sudden attack of fear, and there was a risk of it not returning. Other major spirits were the *teyollia*, associated with the heart, and the *ibiyotl*, associated with the liver. Although these entities were nonmaterial, their actions were usually regarded as natural, not necessarily prompted by the actions of gods or sorcerers.

► THE BADIANUS MANUSCRIPT

One of the main sources of knowledge of Mesoamerican medicine is the *Badianus Manuscript*, an illustrated herbal with the description of 184 plants and their uses. It is also known as the *Codex Barberini*, after an early owner. It was originally compiled in Nahuatl, the language of the Mexica, by Martín de la Cruz, a native physician associated with the Franciscan College of Santa Cruz of Tlatelolco, the earliest institution of higher education in Spanish America. Cruz's work was then translated into Latin by another native, Juan Badianus. The date of the Manuscript is 1552, three decades after the Spanish conquest, and the extent to which the *Badianus Manuscript* reflects European influence remains controversial. Arranged by disease rather than by botanical consideration, it contains descriptions of treatments for epilepsy, skin diseases, wounds, coughs, diarrhea, and foot injuries, among many other medical conditions. For nosebleeds, it recommends juice from nettles mixed with salt, urine, and milk and applied to the nose. Knowledge of the *Badianus Manuscript* was lost for many years until it was rediscovered in the Vatican Library in 1929. In 1990 Pope John Paul II gave the manuscript to the government of Mexico. It is now housed in Mexico City.

—William E. Burns

Diseases were conceived of in terms of hot and cold. Different levels of heat were associated with the different organs of the body. The heart was hotter than the liver, and the male organs were hotter than the female organs. Cold diseases included gout and fevers with chills, while fevers without chills were hot diseases. Cold diseases, however, did not always require hot remedies.

Religion was an important part of Mesoamerican medicine. The Mexica goddess of medicine was Tzapotlatenan, originally a successful human medical practitioner deified after her death. She was a member of the Rain God complex, associated with the god Tlaloc who was viewed as responsible for many diseases. Quetzalcoatl was also considered to be knowledgeable in medicine, and some of his shrines were resorted to by the sick, hoping to be cured by prayers to the god. Ixtilton looked after the health of children.

Different gods were conceived of as having responsibility for different diseases or different aspects of the body. Punishment from the gods could cause disease, as could witches or malevolent supernatural entities. Disease was often viewed as a punishment for sin, particularly sexual sin. Adultery and homosexuality were viewed as particularly likely to bring on disease through the liver and its associated spirit, the *ihiyotl*. The remedy was confession before the goddess Tlazoteotl, the divine eater of filth, who consumed the sins of the confessor. (Tlazoteotl was also the patron goddess of midwives.) After confession, penances such as fasting or the piercing of the tongue with reeds were applied. Seemingly neutral acts such as urinating on particular plants could also result in disease. The day and time a person was born and the positions of the celestial bodies at that time influenced health as well as other aspects of her or his destiny. The day and time when an illness first manifested itself was also astrologically significant. Magical or divine attacks damaged specific organs or areas of the body—for example, a type of sorcerer called the *teyollocuani* (“heart-eater”) ate the *teyollia*, causing weakness and eventually death. Many conditions were treated with rituals, prayers, and spells. However, the same illness could be interpreted as having both natural and supernatural causes, which were not viewed as mutually exclusive.

There were a variety of medical professionals, including those chosen by Tlaloc to cure “cold” illnesses associated with that god. They were chosen by being born on a certain day or being struck by lightning. However, there were also specialists who operated on the basis of medical expertise rather than supernatural status. Both men and women practiced medicine, but there seems to have been a professional division, with men handling wounds, broken bones, and nasal surgery and women handling midwifery, ulcers, and ocular surgery. The frequency of war in Mesoamerican culture made the treatment of wounds particularly important. Treatment of wounds with a sap derived from the leaves of the agave plant, a natural antibiotic, was more effective than contemporary European techniques. Mesoamericans practiced some of the most advanced surgery in the world, with good control of infection even if

they lacked the theoretical framework to understand the concept. Mesoamericans also practiced trepanation, the cutting of holes into the skull, although not with the frequency with which Andeans practiced it.

Physicians were expected to have expertise in the vast Mesoamerican pharmacopeia, which employed around 2,500 plants. Usually Mesoamericans used specific plant products, rather than mixtures, to combat specific diseases. Animal substances were also used, as the tail of an opossum was believed to speed childbirth. Mineral substances were employed as well. As a metal related to the sun and thus the heart, gold was believed to be a treatment for heart pain.

Smallpox Inoculation

Smallpox was one of the most feared killers in the early modern world, and even survivors frequently bore ugly scars, or pocks. The eighteenth century saw the first real advances in its treatment in Europe with the introduction of inoculation. Variolation, the infecting of a healthy person with a mild smallpox to create immunity, had a long history in Asia and Africa and was mentioned in scattered European publications beginning in the seventeenth century. The method of inoculation was done by scratching the skin with a needle to expose blood, and then a thread laced with smallpox would be introduced inside the wound. This method usually caused the patient to fall ill with the disease, but it was not as virulent. Accounts of inoculation from Istanbul appeared in *Philosophical Transactions*, the

journal of Britain's Royal Society, in 1714 and 1716. One of the main sources for the introduction of the actual practice to Europe, however, was Lady Mary Wortley Montagu (1689–1762). Lady Montagu was the wife of the British ambassador to the Ottoman empire, Edward Wortley Montagu (1678–1761), and had observed the practice among Turkish peasant women. On her return to England in 1721, she had her five-year-old daughter immunized by the surgeon Charles Maitland (1677–1748). Montagu responded to attacks on inoculation in a short journalistic piece, "A Plain Account of the Inoculating of the Small Pox by a Turkey Merchant," published in the London newspaper *The Flying Post* in 1722. Physician and collector Sir Hans Sloane (1660–1753) was also working to promote inoculation in England. Inoculation spread quickly in Britain and more slowly on the European continent. George, Prince of Wales, the future George II (1683–1760), helped spread the practice by having two of his daughters inoculated, setting a precedent for German and Russian royalty who would also encourage inoculation by subjecting themselves and their families to it. For many Enlightenment thinkers, inoculation became a symbol of scientific progress.

In Boston, Puritan minister and Fellow of the Royal Society Cotton Mather (1663–1728), who had lost wives and children to smallpox, was the leading champion of inoculation. He worked primarily from the reports in *Philosophical Transactions* and descriptions of African practices from his slave Onesimus. Mather and physician Zabdiel Boylston (1676–1766) began to openly promote inoculation during a smallpox epidemic in Boston in 1721. Mather and other leading Boston ministers who followed his lead to support the procedure were personally attacked by people who thought it too risky. At their head was the anti-Mather journalist James Franklin (1697–1735), proprietor of the *New England Courant*, Boston's independent newspaper, assisted by his younger brother and apprentice Benjamin Franklin (1706–1790). Inoculation was also believed to be an impious attempt to meddle with the will of God, who employed the disease to chastise sinners. While trying to cure smallpox or any other disease that God sent as a punishment was permissible, even obligatory, claiming to prevent disease

► CATHERINE THE GREAT AND SMALLPOX INOCULATION IN RUSSIA

Catherine the Great (r. 1762–1796) of Russia's fear of smallpox was sharpened by the death of Anna Sheremeteva, the fiancée of Catherine's minister Count Nikita Ivanovich Panin (1718–1783), on May 17, 1768. Catherine was inoculated on October 12, 1768, by an English surgeon, Thomas Dimsdale (1712–1800). Dimsdale was a successful inoculator who had written a book on the subject and was brought to Russia specifically for the purpose of inoculating Catherine. The operation was a complete success, and Dimsdale was rewarded with 10,000 pounds, an annual pension of 500 pounds, the rank of councillor of state, and a Russian barony. The young boy from whom the infectious

material was taken, Alexander Markov, was also ennobled. Catherine's son the Grand Duke Paul (1754–1801) was inoculated on November 2, also successfully. These successes were widely publicized, as Catherine's goal was to promote inoculation to her subjects as safe and healthful. The monarch's example began a fad among courtiers, some of whom were inoculated by matter from Catherine's and her son's pustules, assimilating the new practice to the traditional role of the monarch as healer. Catherine also established an inoculation house in Petersburg where Russians could be inoculated for free.

—William E. Burns

was in the mind of many an attempt to forestall God. Boston Christians also found inoculation suspect as an Islamic practice. Franklin even linked the inoculation campaign with the earlier Salem witch-hunt, both examples of the excessive zeal, arrogance, and lack of wisdom of the clergy in general and Mather in particular. There was also secular opposition. Boston's best-educated doctor, William Douglass (1691–1752), believed that the procedure was unreliable and unsafe. These fears were founded on the fact that those inoculated still fell ill with the disease and posed a threat to spreading smallpox to others. A bomb was actually tossed into Mather's house but failed to explode. Mather believed that the Devil had taken possession of those who opposed inoculation and attacked him personally. The pamphlet controversy over inoculation went on for years, long after the end of the epidemic, as the issue became less inoculation itself than Boston ministers' claims to authority. However, when another smallpox epidemic threatened New England in 1730, even Douglass supported inoculation.

Like many medical procedures, inoculation could be done as an elaborate ritual with purges and bloodletting by a physician or quickly and cheaply by a surgeon. One dynasty of British surgeons, Robert Sutton (1707–1788) and his son Daniel (1735–1819), claimed to have devised a cheap, reliable, and effective method to inoculate 400,000 people in 30 years with a very low death rate. Inoculation was never risk-free, and

the fact that inoculated people did sometimes die of smallpox hindered its spread.

The efficacy of inoculation was also the subject of some of the earliest statistical analyses of public health. The secretary of the Royal Society, James Jurin (1684–1750), and the Yorkshire physician Thomas Nettleton (1683–1742) made empirical studies of smallpox's mortality and inoculation's effectiveness. Inoculation also led to a controversy between mathematicians Daniel Bernoulli (1700–1782) and Jean le Rond d'Alembert (1717–1783) in the 1760s over Bernoulli's assertion that probability theory endorsed taking the small risk of inoculation over the large risk of dying of smallpox. D'Alembert, who endorsed inoculation, nevertheless claimed that Bernoulli's argument was weak and based on inadequate data. D'Alembert argued that it was unrealistic to expect a person considering inoculation to treat the immediate risk of death as strictly comparable to the risk of dying of smallpox spread out over the person's remaining lifetime.

Carrying Inoculation from Africa to Boston

From the earliest days of exploration and settlement, smallpox had periodically devastated the Native American population. Slave ships from Portuguese Angola and other West African ports were often blamed for bringing smallpox to the Caribbean and South America. But in 1721 Boston's Puritan minister Cotton Mather (1662–1728) struck the first major blow against smallpox (variola) in the American colonies.

Severe smallpox epidemics, often brought by ships from the West Indies, had periodically struck colonial Boston. Hundreds of colonists, many of them children, had perished in these cycles. Clergymen interpreted these visitations

as divine judgment upon a sinful people. Quarantines, isolation, and the standard remedies of the day had little effect. Survivors, who were immune for life, were often marked by pitted scars. Pock-marked slaves were highly desirable because they were thought to pose no danger to the household.

In 1706 Mather learned from his slave Onesimus about the practice of inoculation in his African homeland. Fluid from the pustules of a natural smallpox victim was scratched into the skin of a nonimmune individual, who usually suffered a mild case leading to lifelong immunity. Mather confirmed the story with other Boston slaves and slave traders. Unbeknown to European physicians at the time, smallpox inoculation was a long-standing folk medicine practice not only in Africa but also in China and India.

► COTTON MATHER AND *THE ANGEL OF BETHESDA*

In isolated New World settlements, religious leaders, as educated men, had traditionally been called upon to provide medical advice. By 1700, larger towns such as Boston had regular medical practitioners, the majority trained by apprenticing themselves to local physicians, as well as a variety of folk healers. Massachusetts Bay Colony's Puritan theologian Cotton Mather was one who was widely read in the European medical and scientific writings of his day. Indeed, he had contemplated a career in medicine before electing to follow in the clerical footsteps of his father, Increase. Mather saw the relationship between medicine and theology as an "angelic conjunction" and did not hesitate to offer medical advice when called upon by family or acquaintances. From 1720 to 1724, he gathered his vast medical knowledge into a single manuscript titled *The Angel of Bethesda*, a reference to the biblical healing pool (John 5:1–9). Many of the 66 chapters blended theology with medicine. *The Angel* was the first medical textbook written in the American colonies but was never published in colonial Massachusetts, possibly due to opposition from the rising medical profession. The American Antiquarian Society eventually published the manuscript in 1972.

—Sandra Moss

Cotton Mather, early American Puritan leader. (Library of Congress)

In 1714 London's Royal Society published a report about the apparently safe and effective practice of inoculation in Turkey. Mather read the article and informed the Royal Society by letter about the practice among African slaves. He resolved to recommend inoculation to Boston's physicians when smallpox next struck Boston.

Smallpox arrived in April 1721 aboard HMS *Seahorse* and spread rapidly. The physicians of Boston, led by European-educated William Douglass (ca. 1691–1752), were familiar with the report from Turkey but were also aware of an unsuccessful French army trial. Worried about multiplying the epidemic already raging in the town, the physicians rejected Mather's advice. They feared that inoculation-induced smallpox was as contagious as smallpox acquired naturally through the respiratory tract. The physicians also resented a minister's meddling in medical affairs.

Mather convinced Zabdiel Boylston (1679–1766), an apprentice-trained Boston doctor well regarded for his surgical skill, to begin an inoculation trial. Boylston, who had survived smallpox in an earlier epidemic and was immune to the disease, successfully inoculated his own son and two slaves. He made a small skin incision and applied the serum from a fresh pustule, dressing the site with a cabbage leaf. But wary local officials attempted to curtail the inoculations, and suspicious townsfolk who opposed inoculation directed their anger at Boylston and Mather. In a war of words in newspapers and pamphlets, the two sides attacked one another on medical and theological grounds. Mather, who referred to smallpox as a destroying scourge, and his pastoral colleagues defended inoculation as a divine blessing and asserted that volunteers for inoculation demonstrated their faith in God. Anti-inoculationists saw the practice as a challenge to divine will. In November angry citizens flung a grenade into Mather's home, where a relative was recovering from inoculation. Mather was spared martyrdom by a faulty fuse.

Despite popular and official opposition, throughout the autumn and winter of 1721 Boylston inoculated children, servants, and leading citizens from Boston and nearby towns. By midwinter the epidemic was over. Boylston used statistics as powerful proof of the efficacy of

inoculation. Of 5,759 Bostonians (roughly half the population) who acquired smallpox naturally, 844 (15 percent) died of the disease. Of 247 people inoculated by Boylston, only 6 people (2 percent) died.

By 1722 inoculation, also called variolization, began to gain favor in Boston. In 1724 Boylston visited the Royal Society in London, where he consulted with British physicians and wrote his account of the Boston epidemic. In the decade that followed the 1721 epidemic, Douglass and other colonial physicians began to practice inoculation. Civic officials enforced strict isolation of inoculees to protect the nonimmune. Later in the century, temporary isolation hospitals were set up under the supervision of a physician who advertised his excellent safety record (usually about 1 percent mortality) and charged for his services. Groups or classes of clients were prepared for inoculation with regimens of cathartics and other medicines. After inoculation, they remained in isolation until the smallpox pustules crusted over. Inoculation began to be seen as a preventive measure even in the absence of a raging epidemic, although the procedure was never without its critics. In the face of a smallpox epidemic that threatened to destroy his army, George Washington ordered that his troops be inoculated under strict isolation conditions in the winter of 1777. Inoculation fell out of favor with Edward Jenner's introduction of the much safer cowpox vaccination at the end of the eighteenth century.

■ Introduction: Science and Gender

Early modern European societies were marked by a strong gender hierarchy subordinating women to men, and this extended to the practice of science. Men were more literate, particularly in Latin, the international language of intellectual life, and had a virtual monopoly of higher education as both teachers and students. The institution most hospitable to professional intellectuals—the Catholic and Protestant clergy—was also male. The all-male models of the clergy and the university professoriat greatly influenced the new model of the scientific profession, with which both had a considerable overlap. Given these circumstances, it was inevitable that the new science of the scientific revolution was as dominated by men and male concerns as was the old science that was being replaced.

The ideology of the European scientific revolution often contrasted the male investigator with a personified Nature conceived as passive and feminine. The English philosopher Francis Bacon expressed this idea most vividly, also characterizing the traditional Aristotelian science of Europe as “feminine” due to its passive attitude toward nature and calling for its replacement by a “masculine” science. Bacon’s *The New Atlantis* depicted a utopia that combined organized scientific investigation with a profoundly patriarchal social and political order. Bacon even began speaking of putting nature “to the question,” that is, torture. The portrayal of the vigorous aggressive male scientist was not always linked to the struggle with female nature, however. Male investigators were also depicted as wrestling with another personification of nature, the shape-changing Greek god Proteus, who according to legend answered the questions of those who bested him.

Although the Aristotelian construction of female inferiority—women were characterized by the weaker qualities of “coldness” and “moistness” as compared to “hot, dry” males—was increasingly questioned along with much else about Aristotelian science, female inferiority itself was seldom doubted by men of the new science. Generally the tendency in the early

modern period was for scientists to emphasize women’s difference from men in contrast to the idea, drawn from the ancient authorities Aristotle and Galen, that women were “imperfect men,” defective creatures who in the womb had lacked the heat to reach the perfection of the male form.

The arenas for women to participate as creative scientists, never many, were also disappearing. The “scientific household” in which women participated as their husband’s or father’s assistants or scientific partners in an alchemical laboratory or astronomical observatory attached to a dwelling was becoming obsolete by the late seventeenth century with the rise of institutions affiliated with governments, universities, or scientific academies. Women were excluded from the new institutions of the European scientific revolution, including the new scientific academies such as England’s Royal Society and France’s Royal Academy of Sciences, and the most elite scientific periodicals. The attendance of celebrated natural philosopher and duchess Margaret Cavendish as a guest at a meeting of the Royal Society provoked great controversy, and she had no successors in the early modern period. The general trend was for women to be less active as scientists as science became more institutionalized.

However, despite these barriers many women did succeed in participating in the new science, and many more were part of its audience. Upper-class women were sometimes patrons of the sciences. Queen Christina of Sweden (1626–1689) invited French natural philosopher René Descartes (1596–1650) to Stockholm to serve as her tutor, with disastrous consequences when he died of the cold. In her later exile in Rome after her conversion to Catholicism, Christina even established a small scientific academy in Rome, the Physical-Mathematical Academy. There was also scientific activity, including experiments in the female-run salons of seventeenth-century Paris. Salon scientific culture was particularly influenced by Cartesianism.

If women were viewed with suspicion or hostility as creators of science, the situation was quite different when they assumed the role of the

audience for male displays of scientific knowledge. The interest in popularization to both men and women was one of the most dramatic differences between the science of the early enlightenment and the science of the Middle Ages and the Renaissance, which was much less public. Sometimes women were expected to receive the new knowledge as part of their professional career, as when surgeons addressed audiences of midwives on anatomy. However, by the late seventeenth century an interest in science was often considered part of the culture of cultivated women. The growing volume of scientific writing in vernacular languages, particularly French, the international language of Europe's social elite, was much more open to women than was the Latin literature. Women were frequently addressed in works of scientific popularization, most notably Bernard de Fontenelle's *Conversations on the Plurality of Worlds* (1686), which presented Cartesian science in the form of a dialogue between an older male scientist and a young noblewoman. The Italian nobleman Franco Algarotti's widely translated *Newtonianism for Ladies* (1737) took a similar approach, as did the Swiss mathematician Leonhard Euler's three-volume *Letters to a German Princess* (1768–1772). In France and to a lesser extent in England, women attended public lectures and demonstrations, and the annual *Ladies' Diary, or The Woman's Almanack*, beginning in 1704, appealed to the scientific and mathematical interests of educated Englishwomen. Women were also encouraged to identify and collect plants as an improving hobby, and some advanced to become skilled botanists. However, the growing emphasis within botany on explorations to collect plants from the far corners of the world favored males as botanists.

Women interested in the sciences, like other learned women, were also the targets of ridicule, notably in the great French comic playwright Molière's *The Learned Ladies* (1672), which satirized Cartesian salon women, and, more affectionately, in the English playwright Susannah Centlivre's *The Basset Table* (1705), which included an enthusiastic female experimentalist. Male virtuosi were also satirized for their unmanly obsession with trivialities, as Thomas Shadwell satirized Sir Nicholas Gimcrack in *The Virtuoso* (1676) and Jonathan Swift mocked the

Academy of Laputa in the third part of *Gulliver's Travels* (1726). However, women were often attacked more viciously than men, with satirists drawing on the traditional prejudice that learned women must be unchaste, unattractive, unfeminine, or bad housekeepers and mothers.

Women and Learning

The fitness of women for intellectual endeavors was widely debated by both men and women in early modern Europe. Women were excluded from Europe's leading intellectual and scientific institutions, the Christian ministry and Jewish rabbinate, the medical profession, the universities of both Catholic and Protestant Europe, the Jewish yeshivas, and the new scientific academies. The rationales for these exclusions varied. The exclusion of women from religious professionalism rested on the belief that God had reserved these positions for men, a belief that few men or women challenged in the early modern period. (The one exception was Catholic religious orders, which produced a disproportionate number of women intellectuals.) Arguments for the exclusion of women from the secular learned professions also sometimes rested on the divine decree of female subordination going back to the book of Genesis but included non-religious reasons as well.

In the Middle Ages, the secular arguments for female intellectual inferiority had been linked to an Aristotelian hierarchical cosmology. Women, exhibiting the "inferior" qualities of coldness and moistness as opposed to the heat and dryness of men, were subordinate to them. The legacy of Aristotelian ideas of female subordination was a powerful one. Margaret

Cavendish (1623–1673), the most prolific female author on natural philosophy in the seventeenth century and an anti-Aristotelian, while strongly asserting her right as an individual woman to set forth her theories, in many of her works accepted the intellectual inferiority of women as a class, perhaps due to the softness of their brains.

In the Renaissance, women humanists were respected but treated as remarkable phenomena, not at all indicative of the potential of women as a class. What raised awareness of the presence of women intellectuals and scientists was the printing press and the rise of vernacular languages. Women were now able to express their ideas in a way that was not dependent on access to institutions and in languages that were not largely restricted to the male elite, as were Latin, Greek and Hebrew. However, many men continued to argue that women should avoid entering their thoughts into print. Women intellectuals were caricatured as avoiding their domestic duties. Even women intellectuals who conformed to the highest standards of Christian virtue could be looked on with suspicion, as they were playing a “public” role reserved for men and were associated with unchastity, the greatest female sin in male eyes. However, certain areas of technology and medicine were considered appropriate for women to publish on, including midwifery and household maintenance.

Renaissance Neoplatonism, which exalted the soul above the body, minimized the intellectual differences between men and women that were asserted on the Aristotelian basis of woman’s biological inferiority. The assumption that “souls have no sex,” common in Christian theology, meant that intellectual women and their allies could now assert that physical differences between men and women were irrelevant to their spiritual and intellectual capacities. (Some argued that women had no souls, but this view was heretical and highly marginalized.) Neoplatonic ideas of gender equality had the biggest influence in Italy, particularly Venice, among such female intellectuals as Tullia d’Aragona (1510–1556) and Lucrezia Marinelli (1571–1653).

Seventeenth-century natural philosophers had different views of the relation of gender to scientific knowledge. Francis Bacon (1561–1626), followed by many Baconians including the

➤ MARIA WINKELMANN AND THE BERLIN ACADEMY

The story of the German woman astronomer Maria Winkelmann (1670–1720) shows that even when a woman’s intellectual ability was undoubted, institutional misogyny continued to exclude her. Winkelmann received her first training at the house of her father, also an astronomer. In 1692 she married the astronomer Gottfried Kirch (1639–1710), hoping to continue her studies. She and Kirch worked together in astronomical observations and calendar making before and after Kirch was invited to Berlin in 1700 as the first astronomer of the newly founded Berlin Academy of Sciences. In 1702 Maria discovered a comet, but since the report of the discovery bore Gottfried’s name as academy astronomer, it was assumed that he had discovered it. He later gave Maria the credit. Gottfried Kirch died in 1710, and Maria petitioned the Berlin Academy to appoint her an assistant astronomer for calendar making. Although she was clearly qualified, the academy, embarrassed to have a woman in an official role, denied her the position. She continued to publish in astronomy. In 1716 when her son Christoph was appointed academy astronomer, Winkelmann moved back to Berlin and continued to work on astronomical calendars, although as a woman she faced much hostility from members of the academy.

—William E. Burns

founders of the Royal Society, argued that true science was a masculine endeavor. However, this distinction was not simply reducible to the difference between men and women—for Baconians, the science of the ancients, despite having been created by males like Aristotle, was quintessentially “feminine”—passive and weak towards nature. Masculine science would take a more active and dominant role to wrest nature’s secrets from her and turn them to human advantage. However, the Baconian vision of institutional science, as laid out in *The New Atlantis* and later embodied by the Royal Society and the Royal Academy of Sciences, had no place for women.

The seventeenth-century natural philosophy that most encouraged female intellectual participation was that of René Descartes (1596–1650). This was not because Descartes was a feminist

or even particularly interested in gender issues, although he did have women intellectual friends and correspondents and ended his life as a tutor to Queen Christina of Sweden. The reason that Cartesianism was available for women's use was that it, like Neoplatonism earlier, assumed a disconnection between the mind and the body. The increasingly fashionable denigration of Aristotle in which Cartesians participated also offered the chance to attack the theories of subordination based on his work. The French Cartesian François Poullain de la Barre (1647–1725) wrote an influential tract supporting gender equality that was translated into English as *The Woman as Good as the Man* (1677).

Although British empiricism, stemming from Bacon, was less friendly to female intellectuals than was Cartesian rationalism, there were significant exceptions. The empirical philosophy of English physician John Locke (1632–1704), who, like Descartes, had numerous female intellectual correspondents and friends, also placed little emphasis on differences of gender, and Locke advocated the same education for upper-class girls as for upper-class boys in his influential writings on education. An anonymous Englishwoman published *An Essay in Defence of the Female Sex* (1696), which combined Cartesian and Lockean ideas to assert the intellectual equality of men and women. However, the most influential woman philosopher of late-seventeenth-century England, Mary Astell (1666–1731), was a Platonist who advocated separate educational institutions for women.

Some hoped to broaden women's education beyond basic literacy and religious training to incorporate science. The French alchemist Marie le Jars de Gournay (1565–1645), author of *The Equality of Men and Women* (1622), and the English scholar, poet, and royal tutor Bathua Makin (ca. 1600–ca. 1674), in her *An Essay to Revive the Ancient Education of Gentlewomen, in Religion, Manners, Arts & Tongues* (1673), put forth proposals for educating women in the sciences, but like many proposals for educational reform in the seventeenth century they had little practical effect. Women's education in the sciences remained restricted to simple math for doing household accounts and some medicine and "kitchen chemistry." However, some

schools for upper-class women in the eighteenth century taught more advanced science, justified either as a diversion or as a way of demonstrating the wonderful works of God.

Women Scientists

Despite the numerous institutional and cultural barriers to women being scientists in early modern Europe, many did manage to participate in the scientific enterprise. The roads for female participation in science were diverse.

Men who operated alchemical labs, astronomical observatories, or other scientific enterprises out of their homes as hobbies or small business enterprises often drew on their wives, sisters, and daughters as assistants, workers, and intellectual partners. In some cases, these women went on to establish themselves as scientific figures in their own right. The tradition of household astronomy was particularly strong in Germany, and many women astronomers were German. One example is Maria Cunitz (1610–1664). Trained by her father in astronomy, Latin, and other "male" disciplines, Cunitz married another astronomer but was the intellectually dominant partner in her marriage. Her main work was a simplification of Johannes Kepler's complex astronomical tables, the *Rudolphine Tables*, designed for use by working astronomers. Cunitz's book *Urania Propitia* (1650) was written in Latin and named after the classical muse of astronomy. In addition to the tables, it also dealt with astronomical theory and practice. Such was the book's quality that Cunitz was referred to as the "second Hypatia," after the ancient Greek woman mathematician. However, many denied that a woman could have

been capable of writing the book, and subsequent editions appeared with a foreword by Cunitz's husband denying that he had any part in it. Another German, Maria Clara Eimmart (1676–1707), the daughter and wife of astronomers, made 250 detailed illustrations of the surface of the moon. The astronomers Johann Hevelius and John Flamsteed worked with their wives, Elizabeth Koopman Hevelius (1647–1693) and Margaret Flamsteed (ca. 1670–1730), as partners in their scientific endeavors. Both women survived their husbands and supervised the publication of the star catalogues their observatories had produced. The inability of women to transform these household positions into recognized salaried positions at public institutions, however, can be seen in astronomer Maria Winkelmann's (1670–1720) failure to be appointed to the Berlin Observatory after the death of her astronomer-husband Paul Kirch (1639–1710).

Women could still possess scientific authority in areas associated with traditionally feminine functions, although this authority would be increasingly challenged by men. The most obvious example is midwifery, at least until the rise of the man-midwife in the eighteenth century. Women published many books on delivering babies. The conflict with the man-midwives and their technologically driven approach to midwifery inspired the publication of the English midwife Elizabeth Nihell's passionate defense of traditional female midwifery, *Treatise on the Art of Midwifery, Setting Forth Various Abuses Therein, Especially as the Practice with Instruments* (1760). Women were also credited with knowledge of technology associated with household management. Manuals of so-called domestic chemistry, often female-authored, contained practical procedures and recipes, but as chemistry developed, these works were increasingly scorned by male chemists. Women of the upper classes also collected and published medical recipes, as tending simple medical problems of their servants and the tenants on their lands was one of their traditional responsibilities.

Women with disposable incomes such as Mary Somerset, Duchess of Beaufort (1630–1714), could be botanical and natural history collectors and gardeners. However, women natural historians were limited by their relative inability

➤ A WORKING SCIENTIST—THE ECONOMIC LIFE OF MARIA SYBILLA MERIAN

Unlike many women who were wealthy or were part of a male-headed household, Maria Sybilla Merian spent much of her life supporting herself and her two daughters through her own efforts. After moving to Amsterdam in 1691, she painted cloth and sold paints to artists. Owners of natural history books also paid her to color in the black-and-white copperplate engravings. Her expedition to Surinam was not just scientific research; Merian's plan was to turn a profit. She and her daughters Johanna and Dorothea, illustrators themselves, planned to collect specimens of Surinamese plants and animals for sale to European collectors. The specimens that Merian brought back, some dried, some preserved in alcohol, were displayed in the town hall of Amsterdam. She also sold paintings that she had made in Surinam. *Metamorphoses of the Insects of Surinam* was a very expensive book, a collaborative effort of Merian and her daughters published on the finest paper available and with some of the earlier editions featuring engravings hand-colored by Merian herself. The most expensive editions were three featuring Merian's original drawings rather than engravings, one of which sold to Tsar Peter the Great of Russia for 3,000 guilders.

—William E. Burns

to travel outside Europe and examine exotic plants and animals in their native localities, an activity that was increasingly prominent in science by the eighteenth century. One exception was German entomologist Maria Sybilla Merian (1647–1717). Like Eimmart, Merian entered the scientific community through one route often considered appropriate for women, as an illustrator. (The only woman on the staff of Paris's Royal Botanical Garden, the center of eighteenth-century botany, was an illustrator, Magdeleine Basseporte [1701–1780].) Merian's first works were illustrations of flowers and insects. At the age of 52, Merian left her home in Amsterdam, the center of world natural history collecting, for Surinam in South America, accompanied by her daughter. After returning to Europe in 1701, she published *Metamorphoses of the Insects of Surinam* (1705). Merian's observations and

vivid illustrations made it a recognized classic, although like many works by women it came under increasing attack by male writers in the subsequent decades. Another exception was Lady Anne Monson (1727–1776), the wife of an officer in Britain's Indian army and an associate of the botanical circle of Carl von Linne.

Although university educations and careers were restricted to men, with a few exceptions in Italy, autodidactic women were able to participate in natural philosophical conversation. René Descartes had several women correspondents, including Princess Elizabeth of Bohemia (1618–1680). Some women went beyond criticizing men's ideas to publish their own theories. In theoretical natural philosophy, the most original woman writer of the seventeenth century was Margaret Cavendish (1623–1673), Duchess of Newcastle. Cavendish's wealth, social position, and support from her husband enabled her to publish several works on natural philosophy including *Observations upon Experimental Philosophy* (1666). She accepted atomism but opposed the mechanical philosophy that reduced the universe to matter and motion in favor of a more vitalistic philosophy of the energies within matter. Her work was too eccentric to have much influence on the scientific establishment. Another English woman natural philosopher was Anne Conway (1630–1679), who unlike the flamboyant Cavendish did not publish

her work or put herself forward in other ways but whose *The Principles of the Most Ancient and Modern Philosophy* was published anonymously after her death. Conway's authorship was widely known, and her antimechanical Kabbalah-influenced vitalist philosophy influenced Gottfried Wilhelm Leibniz, among others.

Women were also active in translating scientific books. The English poet and dramatist Aphra Behn (1640–1689) translated Bernard de Fontenelle's Cartesian *Conversations on the Plurality of Worlds* from French into English with a commentary of her own. The most historically significant female translator was the French noblewoman Gabrielle Émilie Le Tonnelier de Breteuil, Marquise du Châtelet (1706–1749), whose translation of Isaac Newton's *Mathematical Principles of Natural Philosophy* from Latin into French was posthumously published in 1759, contributing to the spread of Newtonian physics in France. It remains the only French version of Newton's masterpiece.

ERA 7 The Age of Revolutions, 1750–1914

An Age of Transformation

Change has occurred in every era, indeed in every year, month, and moment of human history. But true turning points, eras in which change is transformational and revolutionary, are rare. Throughout history there have been only three. The first occurred 200,000 to 250,000 years ago, when after millions of years of evolution the first human beings, *homo sapiens*, emerged in Africa. The second began around the ninth or tenth millennium BCE when agriculture appeared in the Middle East. As agriculture spread to other regions over the next several thousand years, it turned most human beings into farmers and herders and set the stage for the emergence of cities and states, the development of social hierarchies, and inventions ranging from writing and the alphabet to metallurgy. Although humans after 1000 BCE created intellectual traditions and religions of lasting importance and continued to make technological advances, these advances were not transformational. A great majority of human beings devoted their lives to food production, and agriculture remained the basis for society and government.

A third great transformation began around 1750, when human beings learned to build complex machines powered by new sources of energy that increased productivity to unimagined levels, created new wealth, and revolutionized travel and communications. These innovations were accompanied by urbanization, scientific progress, mass education, and many new political and social movements: liberalism, democracy, socialism, feminism, and nationalism as well as fascism and totalitarianism. Taken together, these developments gave rise to new modern societies far different from the agrarian societies in which humans had lived for thousands of years.

Europe was the first region to experience these changes, and Europeans were the driving force behind their spread to other parts of the world. By 1900 a handful of European states, along with the United States, controlled vast empires that stretched around the globe. They had the world's largest and most lethal armies and navies. They produced most of the world's manufactured goods, dominated world trade, and controlled world capital markets. They had the world's highest levels of per capita wealth, the best health care, and the most impressive schools and universities. Never before had global economic and political relations been so decidedly tipped in favor of just one small part of the globe. Europe had been transformed, and Europe had transformed the world. These transformations are the outstanding themes of world history from 1750 to 1914.

Europe's Moment

Although historians have many opinions about the underlying causes of Europe's transformation, they all agree on when it began and what events set it in motion. It began in the late eighteenth century, when England experienced the first stages of the Industrial Revolution and when Great Britain's North American colonies and France experienced political upheavals that changed what people thought about justice, human rights, freedom, and the relationship between rulers and subjects.

England's Industrial Revolution began in the late 1700s with the introduction of a number of new devices and techniques in the textile and iron industries and the development of the first efficient coal-burning steam engines. It continued in the early 1800s, when steam engines found countless new applications and when the artisan's workshop was giving way to mills and factories where hundreds or even thousands of laborers worked in surroundings that allowed for specialization, organization, and discipline. During the 1800s industrialization spread to continental Europe, the United States, and Japan and on a limited basis to other parts of the world. Decade by decade, one technological innovation followed another in an outburst of inventiveness never before seen in history. Whole new industries were created. Commercially viable railroads and electric telegraph systems were introduced in the 1830s, the generation and utilization of electricity became widespread in the 1880s, and gasoline-powered engines were introduced in the 1890s. New methods were developed for making steel, paper, and industrial chemicals. Refinements of gear shapers, lathes, drill presses, and other machine tools enabled manufacturers to make and maintain sophisticated and specialized machines for the production of everything from farm implements to bicycles to guns. Productivity soared.

Largely because of industrialization, during the nineteenth century Europe became the hub of a global system of trade and finance in which it was the dominant exporter of manufactured goods and a voracious importer of coffee, rubber, tin, palm oil, wheat, cotton, metals, and other primary products. Europe also exported vast amounts of capital throughout the world, where English pounds, French francs, German marks, and Dutch guilders were used to build railroads, telegraph systems, and canals and to fund banks and government loans.

By increasing Europe's standard of living and making available new sources of food, industrialization contributed to a threefold increase in Europe's population between 1750 and 1900, from 150 million to 450 million.

Industrialization changed European society in many ways. By increasing Europe's standard of living and making available new sources of food, industrialization contributed to a threefold increase in Europe's population between 1750 and 1900, from 150 million to 450 million. Furthermore, as a result of the emigration of between 50 million and 60 million Europeans in the 1800s, the number of people of European descent living abroad

grew from approximately 9 million in 1750 to 150 million in 1914. Within Europe the makeup of the population also changed. As factories

spread, the numbers of craftsmen, rural laborers, and small farmers declined. In contrast, the middle class, including everyone from petty clerks to prosperous businessmen, grew in numbers and wealth, and a large class of unskilled industrial workers emerged. By the late 1800s girls were being educated alongside boys in public schools, and more women were attending universities and entering the paid workforce as teachers, nurses, office workers, and retail clerks. Feminist movements demanding legal and political equality for women were gathering strength. Most importantly, industrialization made Europe increasingly urban. Around 1800 only 12 percent of the population lived in towns with populations over 5,000. By 1900 that percentage had increased to 34 percent and was just short of 40 percent if largely rural Russia is excluded. In 1900 Europe had 226 cities with populations over 100,000 and 12 with populations over 1 million.

Inevitably, economic and social changes of such magnitude affected politics. In the 1700s Europe was made up of hundreds of states, many of them small principalities, city-states, and ecclesiastical territories in present-day Germany and Italy. Most of these states were monarchies in which kings ruled by divine right and without representative institutions or constitutional checks. Everywhere society was based on the principles of hierarchy and privilege. High offices in government and the military were monopolized by aristocrats who enjoyed exemptions from certain taxes and a host of other legal and honorific privileges. Tax burdens fell disproportionately on politically disenfranchised peasants and in large states such as France varied from province to province and city to city.

The institution of absolute monarchy and the principles of hierarchy came under increasing scrutiny in the eighteenth century, especially in France. Writers such as Montesquieu and Voltaire praised England's limited monarchy, in which landowners and merchants had forced their monarchs to recognize the powers of Parliament and accept other constitutional restraints as a result of two seventeenth-century revolutions. The Swiss-born writer Jean-Jacques Rousseau proposed that political legitimacy was based on popular sovereignty, not divine right. In the 1780s Europeans were intrigued by what had occurred in North America, where after the American Revolution the former 13 colonies had come together to found the United States of America, a republic with a written constitution that guaranteed basic human rights.

The great turning point in Europe's political history was the French Revolution of the 1790s. Although not the first political upheaval in Europe's history to be called a revolution, no previous revolution matched the extent, ambitions, and impact of the revolution in France. This was the first revolution to involve an entire population. Peasants, artisans, unskilled workers, women, members of the middle class, clergy, and even nobles played key roles. This was also the first revolution to go beyond removing a particular monarch or seeking narrow changes in politics or religion. French revolutionaries sought a complete break from the past and the creation of a radically new type of society based on reason and equality.

The French Revolution also introduced nationalism as a potent political force. Previously, Europeans had shown little emotional

attachment to governments in which they had no voice and that they perceived as representing the interests of a privileged minority. This changed when the French overthrew their monarchy, ended the privileges of the nobility, and created a government based on democracy, liberty, and equality. When a coalition of states declared war on France in 1792 to restore the old political order, the French fought with patriotic fervor to preserve their revolution and extend its principles. First under revolutionary regimes and then under Napoleon, the French by 1810 had established an empire and alliance system that stretched from the Iberian Peninsula to Russia. In response, nationalism began to stir in other parts of Europe.

In the short term the French Revolution failed to realize many of its goals. The idealism of the 1790s gave way to the heavy-handed rule of Napoleon after 1799 and the restoration of the old regime in France and much of Europe after 1815. Efforts to turn back the clock proved futile, however. By 1914 monarchs still reigned, and aristocrats still played important roles in government, but they did so in states with written constitutions, representative assemblies, political parties, and regular elections. Democratization was accompanied by the emergence of socialist parties dedicated to the principle of social and economic equality. By 1914 nationalism had redrawn the map of Europe. Italy and Germany had become unified nations, and Belgium had gained its independence from the Netherlands, Norway had gained its independence from Sweden, and Greece, Romania, Serbia, and Bulgaria had gained their independence from the Ottoman empire. In 1905 even Russia, the archsymbol of autocracy and repression, experienced a revolution that resulted in a state parliament, the recognition of political parties, and a written constitution.

Europe and the World

While Europe itself was undergoing sweeping changes, it was also transforming the world as a result of its economic reach, its empire building, and the emigration of millions of its people. Imperialism was nothing new for Europeans. In the 1500s and 1600s Europe's maritime states laid claim to the Americas, the West Indies, and the Philippines, while Russia extended its borders across northern Asia to the Pacific Ocean. Between the 1780s and the 1820s most of Europe's American colonies won their independence, but in Africa and Asia new European empires were emerging. The British gained control of parts of India, the Russians added territories in the Caucasus region, the Dutch extended their power in the East Indies, and France invaded Algeria. Then, between the early 1870s and 1900 Great Britain added 4.5 million square miles (11.7 million square kilometers) and 66 million people to its empire, France added 3.5 million square miles (9.1 million square kilometers) and 26 million people, Russia added half a million square miles (1.3 million square kilometers) and 6.5 million people, and Germany added 1 million square miles (2.6 million square kilometers) and 13 million people. Acquisitions by Belgium, Italy, and the United States

added to these totals. By 1900 one-third of all the earth's people lived in European or American colonies.

What accounts for this explosion of European empire building? One part of the explanation was the ever-widening technological and military gap between Europe and the rest of the world. With steamship navies, magazine-fed repeating rifles, and machine guns, Europeans and the native troops they paid to fight for them had distinct advantages when facing African or Asian resistance. The electric telegraph, oceangoing steamships, and the opening of the Suez Canal in 1869 also played important roles. In 1800 a letter from London took five to eight months to reach India, depending on the season; by 1870 a telegraph message from London to India took just five hours. The Suez Canal shortened the voyage from London to Bombay (present-day Mumbai) by half and to Singapore by almost a third. The introduction of faster and more efficient steamships reduced the time further. All these advances enabled Europeans to administer colonies and manage distant business enterprises with a speed and efficiency unimagined in the past.

Not all Europeans (or Americans) favored imperialism. Anti-imperialist sentiment goes back to the eighteenth-century Enlightenment and continued in the nineteenth century in the writings of Jeremy Bentham, John Stuart Mill, and others. During imperialism's heyday, left-wing political parties generally opposed colonization, and in 1899 the treaty by which the United States annexed the Philippines inspired heated debate in the U.S. Senate and barely received the two-thirds approval necessary for passage. Clearly, however, during the late nineteenth century proimperialist arguments won the day among statesmen and most members of the general public.

Many were convinced that colonies made economic sense in an age of industrial expansion and growing competition. At a time when trade was stagnating as a result of an economic downturn and growing protectionism, colonies could serve as safe markets for manufactured goods; as sources of many industrial raw materials and consumer goods such as coffee, tea, and sugar; and as areas for investments in mining, road building, railroad construction, and other enterprises. In an atmosphere of growing nationalism, an empire came to be viewed as a badge of national greatness. As rivalries intensified, it was difficult to stand by when a rival grabbed a bit of territory in Africa or Asia. These points of view emerged in an intellectual atmosphere that justified European dominance because of the supposed superiority of European values and institutions, a superiority thought to be linked to inherent racial qualities. Imperialists furthermore were convinced that colonial rule would foster the work of missionaries, advance education, expand health care, end slavery, improve the lot of women, and teach the values of hard work and discipline. Colonialism, they maintained, was more than a matter of pursuing national self-interest. It was also a civilizing mission to advance human progress.

What accounts for this explosion of European empire building? One part of the explanation was the ever-widening technological and military gap between Europe and the rest of the world.

Europe Extended: The Americas and “Neo-Europes”

European ascendancy from 1750 to 1914 can be measured not only in terms of Europe’s empires but also by the extent to which Europeans exported their institutions, values, languages, and religions to the Americas, southern Africa, Australia, and New Zealand. All of these regions had at some point been part of European empires, and all achieved political independence before 1914. All experienced substantial European migration and settlement, especially in the nineteenth and early twentieth centuries, when they attracted approximately 60 million European immigrants.

In all these regions European conquest and settlement transformed the makeup of the population. Inhabitants of the Pacific Islands and Indigenous Australians were ravaged by European diseases and along with the Khoikhoi, Xhosa, Zulu, Herero, Ndbele and countless other Africans were driven from their lands. In parts of Latin America and Canada, native peoples intermarried with whites to produce populations of mestizos, métis, or “coloreds.” Populations were further diversified in the Americas by the continued importation of African slaves well into the nineteenth century. The Americas and to a much lesser degree southern Africa also attracted smaller numbers of Asian immigrants. In all these regions, however, Europeans dominated economic and political life, Christianity gained new followers, and the use of European languages spread.

European political control ended first in the Americas, where the Thirteen Colonies won their independence from Britain between 1776 and 1783 and where Latin America threw off Spanish and Portuguese rule in the 1810s and 1820s. In North America the former colonies came together to form a single nation, the United States of America, while in Latin America independence resulted in the founding of just short of 20 new states, from Mexico in the north to Chile and Argentina in the

south. Each of these new states became a republic except Brazil, which was a monarchy until 1889. None of them escaped political conflict. In Latin America liberals battled conservatives, federalists battled centralists, and Catholics battled secularists; periods of constitutional government alternated with rule by military strongmen. Regionalism was also a source of

conflict, especially in Brazil, Argentina, and the United States, the latter of which fought a bloody civil war between 1861 and 1865. Property restrictions and systems of indirect elections disenfranchised the mass of the peasantry in much of Latin America, where republican and dictatorial governments alike represented the interests of large landowners and businessmen. Democracy in the United States was also less than perfect. By 1914 women could vote in presidential elections in only two states, and after emancipation most blacks were prevented from voting by intimidation and systematic exclusion from the voting rolls.

In Latin America liberals battled conservatives, federalists battled centralists, and Catholics battled secularists; periods of constitutional government alternated with rule by military strongmen.

In contrast to the experience of the rest of the Americas, Canada's path to political independence was largely peaceful. Originally settled by small numbers of French fur trappers and farmers, Canada became part of the British Empire following the British victory over France in the Seven Years' War (1756-1763). In the late eighteenth century and the nineteenth century its English-speaking population grew as a result of immigration of British Loyalists during the American Revolution and migration from Britain. Despite tensions between French-speaking Lower Canada and English-speaking Upper Canada, people in both regions chafed under British rule, and in the 1840s, rather than risk another war for independence, the British withdrew their troops, agreed to the unification of Upper and Lower Canada, and granted this new entity the machinery of self-government. In 1867 the British Parliament passed the British North America Act, which approved the formation of the Dominion of Canada, consisting of “old Canada,” the provinces of Quebec and Ontario, and the maritime provinces of New Brunswick and Nova Scotia. Canada, now a self-governing state within the British Empire (with foreign affairs controlled by Great Britain until 1931), soon embarked on a period of westward expansion that resulted in difficult interactions with native peoples and métis but ultimately resulted in the incorporation of Manitoba, British Columbia, Saskatchewan, and Alberta into Canada between 1870 and 1905.

Canada's experience was a model for other British colonies with significant white English-speaking populations. Australia accepted dominion status in 1901, followed by New Zealand in 1907. The road to independence in South Africa was rockier. Settled by Dutch farmers in 1652 and annexed by Great Britain in 1806 during the Napoleonic Wars, in the 1800s the region saw a three-way struggle among the Zulu and other African tribes; the Boers, mainly Afrikaans-speaking descendants of the Dutch settlers; and more recently arrived English businessmen, settlers, and officials. Following the South African (or Boer) War from 1899 to 1902, the two Boer republics, Transvaal and the Orange Free State, became part of the British Empire but with the promise of limited self-government. In 1910 they united with two British colonies, Natal and the Cape Colony, to form the Union of South Africa. Blacks were barred from sitting in the new state's parliament, which in 1913 restricted black land ownership to regions that made up just 7 percent of the new state's territory.

By the early 1900s the Americas and the new dominions in the British Empire were important players in the world economy. After the Suez Canal opened in 1869 and refrigerated steamships were introduced in the 1870s, New Zealand became an exporter of mutton and dairy products, while Australia exported great quantities of wool. South Africa was a major source of gold and diamonds. Canada exported fish, meat, dairy products, lumber, and wheat. Latin America prospered in the late 1800s from its exports of beef, sugar, hides, guano, and metals. Banks, railroads, and shipping, however, were controlled mainly by British investors, and the region's manufactured goods were overwhelmingly British imports. So great was Latin America's dependence on European investments, markets, and manufactures that the late nineteenth

century is referred to as an era of neoimperialism, reminiscent of the region's status during the colonial era.

The United States was also an exporter of primary products, with the South a main source of cotton for England's textile mills and the Great Plains a major supplier of Europe's wheat. But the United States also became a major industrial power. Blessed with coal, petroleum, and iron ore along with a skilled and energetic workforce, an expanding domestic market, a boom in railway construction, ample capital, and probusiness governments, American manufacturers after the Civil War pumped out a huge stockpile of industrial and consumer goods. By 1914 the United States was a dominant force in the world economy and was about to assume an equally important role in politics.

Africa and Asia in the Age of Imperialism

Although European imperialists claimed that their imperialist conquests were spreading the benefits of civilization, few Asians or Africans were eager to be “civilized” by becoming subjects of a European power. Although some collaborated with Europeans out of self-interest, a more common response was resistance, first seen in the British conquest of India in the 1700s. The British gained a foothold in Bengal in 1757 after defeating the Bengal Army at the Battle of Plassey and confirmed their authority in 1764 at the Battle of Buxar, in which an army of European and sepoy (native) soldiers defeated the combined forces of Bengal, Oudh (Awadh), and the Mughal emperor. Over the next several decades the British extended their authority in India, but only after fighting wars against Mysore (1766–1799), the Maratha Confederacy (1775–1818), and the Sikh kingdom of the Punjab (1845–1846 and 1848–1849).

In Southeast Asia, British hegemony in parts of Burma (Myanmar) was established in 1826 after the First Anglo-Burmese War and extended to all of Burma in 1886 after the Third Anglo-Burmese War. The Vietnamese fought the French in two wars, and the Filipinos, having just won their independence from Spain, fought the United States between 1899 and 1902 to prevent annexation. Wars against Dutch rule in the East Indies were fought by the Javanese between 1825 and 1830 and by the Sumatran sultanate of Aceh between 1873 and 1904. In Africa, resistance to European aggression was offered by the Zulu and Ndebele in southern Africa, the Ethiopians and Sudanese in the northeast, the Asante in the west, and the Algerians in the north. The extension of Russian power in the Caucasus and Inner Asia resulted from a series of wars from the 1770s to the 1870s against the Ottoman empire, Persia, Chechnya, Dagistan, and numerous smaller territories and tribal groups.

The Europeans were victorious in all these wars except two, the First Anglo-Afghan War of 1839–1842 and the Italo-Ethiopian War of 1895–1896. But their victories were costly. The French were forced to commit 100,000 troops to fight in Algeria, one-third of its army at the time. Between 1899 and 1902 the United States sent 126,000 troops to fight in the Philippines and lost over 4,000 of them. Asian and African casualties were much higher. It is estimated that between 1750 and 1913

colonial wars cost 300,000 European lives and between 800,000 and 1 million among their opponents. Some historians claim that if deaths by famine, disease, and forced migration are included, as many as 25 million Africans and Asians may have died as a result of colonial wars.

Once colonial rule had been established, victors faced the challenge of governing millions of new subjects, few of whom were pleased with their new status. In a number of notorious cases, the first impulse was self-enrichment through plunder. After taking control of Bengal, officials of the British East India Company extorted “gifts” from Indian princes, appropriated tax revenues, took advantage of special trade arrangements, and happily accepted bribes from Indian merchants and bankers. Robert Clive, the victorious commander at Plassey, returned to England in 1760 at age 32 as one of the kingdom’s wealthiest men. The actions of Clive and his colleagues were roundly condemned, and soon the English government imposed controls over the behavior of its greedy merchants.

Other examples abound. In the 1830s the Dutch imposed the so-called Cultivation System on Sumatran and Javanese farmers, who were forced to allocate acreage to cash crops such as coffee, tea, sugar, and indigo, which the Dutch then sold on the international market. By the 1850s, profits from the system provided over 30 percent of state revenues for the Netherlands government. However, by the 1860s Dutch public opinion had turned against the Cultivation System as excessively exploitive, and the system was gradually dismantled. A few decades later Belgian king Leopold II also had dreams of instant riches when he managed to turn much of east-central Africa into his private colony, the Congo Free State. After claiming all uncultivated land in the colony, his agents compelled villagers through torture, intimidation, mutilation, and murder to meet quotas for the collection of rubber and ivory. His enterprise became an embarrassment for the Belgians, whose government took over his holdings after information about his brutal regime caused an international outcry.

In most cases the goals and policies of the colonizers were more modest, though no less motivated by self-interest. At minimum, colonial administrators sought to create and maintain a level of economic activity that would provide sufficient tax revenues to make the colonies self-supporting while simultaneously benefiting the economies of the mother countries by providing food and raw materials, opportunities for investment, and a market for manufactured goods. Reaching such goals required administrations capable of providing law and order and efficient tax collection, all at minimal expense.

Colonial regimes varied, but overall their similarities are more striking than their differences. All of them were basically authoritarian, with authority in the hands of Europeans. In the Indian Raj, policy decisions and appointments were made at first by the East India Company’s Court of Directors, next by the royal Board of Control, and after company rule

Some historians claim that if deaths by famine, disease, and forced migration are included, as many as 25 million Africans and Asians may have died as a result of colonial wars.

ended in 1858 by the secretary of state for Indian affairs. Until 1854 administration of Britain's other colonies was the responsibility of the secretary of war and afterward the colonial secretary. By the early 1900s all major imperialist states had ministries to oversee their colonies except the United States, which gave the president authority to set policy for the Philippines. In the colonies themselves authority was exercised by an appointed official, usually a governor-general, under whom served department heads and provincial administrators. Overall the number of European colonial officials was small. In the late 1800s approximately 6,000 English officials worked in the Indian Civil Service at a time when India's population was around 300 million. In Rwanda and Burundi, two kingdoms in German East Africa with a combined population of 4.5 million, there were 11 German civil servants and 40 German soldiers in 1914.

Nowhere was a serious effort made to seek input and advice from the colonized. Though natives served on legislative councils to advise the governor-general and provincial governors in several British colonies in Africa (from the 1840s) and in India (from the 1860s), they were handpicked from the elite and rarely dissented from the official line. Only in 1909 was a highly restricted Indian electorate given the right to vote for assembly representatives. In any case, neither the governor-general nor the provincial governors were obligated to accept the advice they received.

Although denied political power, Africans and Asians were essential for the functioning of all colonial regimes. Colonial armies were officered by Europeans but consisted mainly of native troops. Native people also were responsible for local administration. The British Empire is best known for its reliance on "indirect rule," a policy identified with the colonial administrator Frederick Lugard in which the British relied on traditional rulers—princes, chiefs and emirs—to collect taxes, settle minor disputes, and enforce other regulations. Although French and Dutch administrators had somewhat more interactions with their colonial subjects, they too depended on appointed "chiefs" or village leaders to carry out policies at the ground level.

With the exception of the Portuguese, who were content to make their money in Mozambique and Angola "the old-fashioned way" through the sale of slaves and the export of contract labor, other co-

lonial powers sought to profit from their possessions by encouraging economic development and integrating the colonial economies into global markets. This meant claiming whatever mineral wealth the colony might have and encouraging farmers to grow crops for which there was global demand. Vast tracts of land were appropriated and given or sold at bargain prices to individual Europeans or businesses for mining or farming. Europe-

ans also received rights to mine diamonds and gold in southern Africa, tin in Malaya, and phosphates on Pacific islands. For lands that remained in the hands of Asians and Africans, colonial regimes frequently

To meet demands of European businesses for workers, colonial governments requisitioned unpaid labor and forced villagers to accept wage-paying jobs by requiring that taxes be paid in cash rather than in agricultural products.

required that acreage be set aside for cash crops, such as cotton in eastern Africa and sugar and coffee in Java. To meet demands of European businesses for workers, colonial governments requisitioned unpaid labor and forced villagers to accept wage-paying jobs by requiring that taxes be paid in cash rather than in agricultural products.

Colonial regimes supported infrastructure projects when they could afford them, and the projects served their purposes. Mainly using money raised through taxes on the colonies themselves, they improved harbors, built roads, installed telegraph systems, and, most importantly, introduced railroads. The first railroad lines were laid in India in the 1850s, and by the end of the century India had more than 25,000 miles (40,234 kilometers) of track, more than all of Asia combined and the fourth-largest railroad system in the world behind the United States, Canada, and Russia. The railways were foreign-owned, financed through the issue of bonds guaranteed by the Indian colonial government, and consisted of rails and moving stock manufactured in England.

One thing that was not encouraged was native industrialization. Only India showed a modest degree of industrialization, and this only after its handicraft-based cotton industry had been damaged (but not wiped out entirely) by cheap English imports. The first Indian cotton mills were built with English capital in the 1850s, and more such mills were established after the 1870s when a number of Indian entrepreneurs became involved in the industry. By the late 1870s India was supplying cotton yarn for the Chinese and Japanese markets, but weaving enterprises struggled to overcome English competition. India and the rest of the colonial world were still overwhelmingly agrarian in 1914 and remained so at the time of independence later in the twentieth century.

By the early 1900s it was still too early to offer answers to the question of whether imperialism, as many of its advocates claimed, benefited the Africans and Asians who came under its sway. In many regions the colonial era had just begun. Even in the early 1900s, however, some preliminary judgments could have been made. Imperialism's defenders could cite the Europeans' success in limiting slavery and the slave trade, founding schools and universities, introducing modern medical care and industrial-age technologies, providing security, and spreading Christianity. Imperialism's detractors also could have made some strong points. They could have pointed to the deaths of many tens of thousands of native Australians, Maori in New Zealand, and other Pacific islanders from contact with European-borne diseases. They could have cited the millions of Asian and Africans who died in colonial wars and rebellions. They also could have cited atrocious examples of cruelty that occurred in the jungles of Leopold II's Congo and the deserts of German Southwest Africa, where rebellious Herero were driven into the Kalahari Desert to die of thirst when German troops were ordered to block their access to water. Others could point to the underlying racism of the whole imperialist project, the self-interest behind economic policy, and the hypocrisy of campaigning against slavery while using forced labor to build roads.

Many Asians and Africans accommodated themselves to their new rulers. Some, who benefited from new educational and professional

opportunities, expressed their gratitude to Europeans for opening the door to science, Western thought, and new technologies. Many, however, were deeply resentful. The Java War (1825–1830), the Maji-Maji Rebellion (1905), the Herero War (1912), and the Indian Rebellion (1857–1858) were major uprisings, and there were countless others on a smaller scale. By the late 1800s nationalist movements were taking shape in Vietnam, Africa’s Gold Coast, Egypt, and especially India. In 1885 the Indian National Congress was founded to win educated middle-class Indians a voice in decision making and greater opportunities in the Indian Civil Service. Two decades later extremists within the organization were calling on the British to “quit India” and were sponsoring civil disobedience campaigns and boycotts to make sure the British got the message. The Indians rallied to the British cause in World War I, sending troops to fight in the Middle East, Africa, and Europe. But nationalism grew in the interwar years, and after World War II India and Pakistan won their independence, the first major step in the disintegration of the vast European empires built between 1750 and 1914.

Independent States in Africa and Asia

In all of Africa and Asia, only seven states were still independent in 1914. One of them, Liberia, which was founded as a colony by private philanthropists for repatriated American slaves, avoided partition by England and France only because of diplomatic pressure from the United States. In the other six states—Ethiopia, the Ottoman empire, Persia, Thailand, China, and Japan—leaders understood the precariousness of their situations and implemented programs of military, political, and economic reform to defend their territorial integrity and sovereignty. The timing, implementation, and results of these programs differed, but only one was an unequivocal success. Japan not only avoided foreign control but also became an agent of imperialism itself.

Ethiopia preserved its independence as a result of military preparation and battlefield success against Italy, one of the weaker European powers. Although steps toward strengthening Ethiopia’s military had been taken by his immediate predecessors, Emperor Menelik II (r. 1889–1913) receives most of the credit for preserving Ethiopia’s independence. On taking power he was aware of Ethiopia’s vulnerability especially in relation to Italy, which was eager to prove that it was a great power by jumping into the scramble for Africa. In 1889 he conceded to the Italians the disputed prov-

Against an Ethiopian army of 80,000 to 100,000, Italy suffered a humiliating defeat and was forced to sign the Treaty of Addis Ababa, which recognized Ethiopian independence.

ince of Eritrea to buy time to outfit and enlarge his army in anticipation of an Italian attack. The attack came in 1895, when a dispute over the wording of the 1889 Treaty of Uccialli provided Italy a reason to invade. At the Battle of Adowa, fought on March 1, 1896, the 18,000-man Italian Army, consisting mainly of new conscripts and Eritreans, was hampered

by a shortage of artillery, outdated guns, and inaccurate maps. Against an Ethiopian army of 80,000 to 100,000, Italy suffered a humiliating defeat and was forced to sign the Treaty of Addis Ababa, which recognized Ethiopian independence.

After his victory, Menelik took steps to modernize Ethiopia's economy and educational system. New roads were built, harbors were upgraded, and banks, a postal service, railroads, and telephone and telegraph systems were all introduced with the help of European advisers and capital. Nonetheless, Ethiopians feared renewed European interference when Menelik died in 1913. They were saved by the outbreak of World War I in 1914, but in the end they could not escape colonization. In 1936 an invasion ordered by the Italian dictator Benito Mussolini led to Ethiopia's annexation in May 1937.

Whereas Menelik relied on military preparedness to protect Ethiopia's independence, the rulers of Thailand, Mongkut (r. 1851–1868) and his son Chulalongkorn (r. 1868–1910), took a more nuanced approach to prevent a British or French takeover. Aware of European military capabilities, their strategy was to avoid giving England or France a pretext for armed intervention while simultaneously pursuing government reform and economic modernization. Mongkut, for example, in 1855 signed a treaty of commerce and understanding with Britain that served as a model for treaties with other Western powers. By doing so, he not only avoided conflict but also attracted capital for banks and construction projects. Chulalongkorn continued his father's policy of conciliation and reform. He gradually abolished slavery, reformed the police and judicial system, and overhauled his administration. Working with European experts, he founded academies to train army and navy officers, sponsored schools for children of aristocratic families, and encouraged study abroad. Despite these efforts, Chulalongkorn still faced French and English territorial demands. Between 1893 and 1909 he ceded Laos and two Cambodian provinces to the French and four Malay provinces to the British. But the core of the country was preserved.

Persian rulers also pursued a policy of diplomacy, military reform, and economic development to protect their nation's territorial integrity and independence. But their plans were poorly executed, and as a result, by the early 1900s much of Persia was under the control of Russia and Britain. In the early 1800s Persia was just beginning to recover from decades of anarchy following the fall of the Safavid dynasty in the 1720s. When the Qajars, a Shia tribe from northern Persia, took power in 1794, they inherited a disunited country, an entrenched clerical elite, and an economy based almost entirely on agriculture and pastoralism. Aware of the Qajars' tenuous hold on power and stung by military defeats at the hands of the Russians in the 1810s, Crown Prince Abbas Mizra (1783–1833) and a number of other Persian princes sought to reform the military. They developed "new armies" comprised of full-time soldiers trained by European officers and equipped with modern firearms and artillery. These troops performed poorly in the Russo-Persian War of 1828–1830, and for the rest of the nineteenth century military reform was a low priority for the Qajar shahs. As a result, in the early 1900s Persia had a tiny navy and only a 25,000-man army, comprised of

poorly trained conscripts, irregular tribal fighters, and a Russian-trained “Cossack” brigade.

Persia managed to retain a semblance of independence only because the two interested European powers, Russia and Great Britain, counterbalanced one another. Beginning in the 1850s, Russian and British diplomats sought to influence Persian foreign policy (often through bribes), while their businessmen competed for concessions to control Persian shipping, railroad construction, insurance, petroleum, and tobacco. Such concessions attracted foreign capital and lucrative bribes for the shah and his officials but disgusted many of his subjects. In 1891 the government was forced to revoke a tobacco concession to a British firm after it caused nationwide demonstrations and a boycott of all tobacco products.

By the turn of the century government policies had generated opposition from many groups including the Shia clergy, who opposed their rulers’ infatuation with things European; businessmen who resented concessions; and officials, journalists, and intellectuals who sought constitutional limitations on the Qajars’ arbitrary rule. In 1905 antigovernment protests in Teheran forced Shah Muzaffar al-Din to approve a new constitution that provided for a parliament with control over finances and foreign affairs. With the new government facing bankruptcy and widespread disorder, in the fall of 1907 Russia and Britain announced the Anglo-Russian Convention. This made northern Persia a Russian sphere of influence and allocated a smaller region in the southeast to Britain. The Persian government maintained authority over a middle portion of the country, which faced civil war and continued Russian and British interference until World War I. Persia was still independent, but its experience in the nineteenth century was hardly a success.

In contrast to Persia, Ethiopia, and Thailand, the Ottoman empire and China were both major world powers in 1750. China was fresh from conquests in central Asia, had the world’s largest economy, and was in the midst of a long period of effective rule under its fourth Manchu emperor, Qianlong (r. 1735–1796). The Ottoman empire, centered in Anatolia, was no longer a feared military power, but it still ruled a multi-ethnic, religiously diverse empire that stretched over three continents.

China and the Ottoman empire both experienced foreign and internal threats in the nineteenth century, and in response their rulers made efforts to introduce wide-ranging reforms. Much was accomplished but not enough to preserve the Ottoman empire or China’s tradition of imperial rule. China’s imperial age ended in 1911 when the Qing dynasty was overthrown, and the Ottoman empire ended in September 1922 when the parliament of the new Turkish republic abolished the sultanate. The heir of the Ottoman empire was the smaller secular nation-state of Turkey, in which its new leader Mustafa Kemal relentlessly pursued policies of modernization and Westernization that in many respects drew upon the efforts of nineteenth-century Ottoman reformers.

Reform became a topic of discussion among Ottoman officials much earlier than in China. Beginning in the seventeenth century, many Ottoman officials wrote memoranda outlining plans for ending corruption, increasing revenues, revitalizing the army, and regaining control of the

provinces. In the late eighteenth and nineteenth centuries, reform also became a priority of the sultans and their closest advisers. With territories in Europe and a history of fighting European armies, Ottoman leaders were aware of the economic and military changes taking place in Europe and their need to catch up if they hoped to compete with their long-time rivals.

In contrast, reform in China became a priority only in the mid-nineteenth century. Although signs of dynastic decline first appeared in the late 1700s, they failed to spark major concern. Indifference also characterized China's early dealings with Europeans. British appeals to expand trade were rejected, and emperors and officials continued to view Europeans as their inferiors. Then in the mid-1800s catastrophe struck. Following defeat by the British in the First Opium War (1839–1842), China was forced to accept the first of what proved to be several unequal treaties that resulted in territorial losses in Burma, Vietnam, Korea, and Taiwan and the acceptance of spheres of influence in which foreigners claimed special rights and economic privileges. More catastrophic was the eruption of three major rebellions: the Taiping Rebellion (1851–1864), which raged through central China; the Nian Rebellion (1851–1868) in the north; and a series of Muslim revolts (1855–1873) in the west. The rebellions were suppressed but at great cost: an estimated 20 million deaths resulted from the Taiping Rebellion alone.

Early Chinese and Ottoman reform movements both focused on strengthening the military. The centerpiece of the New Order introduced by Sultan Selim III in 1792 was a new army unit made up of professional soldiers trained by European officers and given modern weapons and artillery. Administrative changes and tax reforms were devised to pay for these new troops, and educational reform meant founding military schools for future officers. China's Self-Strengthening Movement, which began in the 1860s, had a similar focus. Its advocates believed in the superiority of Chinese values and institutions but conceded that China had fallen behind Europe militarily. Thus, China could strengthen itself by recommitting to Confucian values and by introducing the study of Western languages, mathematics, and science. This would give them the expertise to build the ships and weapons needed to surpass and defeat the West.

In both the Ottoman empire and China, the meaning of reform changed over time. Sultan Mahmud II (r. 1808–1839) continued to emphasize strengthening the military but made a broader commitment to Westernization. His government sent young men to Europe to study, encouraged steamship service between France and Anatolia, and founded publishing houses, newspapers, and schools with specialties in science and mathematics. During the era of Tanzimat, or restructuring, that took place under sultans Abdul Mejid (r. 1839–1861) and Abdul Aziz

Reform became a topic of discussion among Ottoman officials much earlier than in China. Beginning in the seventeenth century, many Ottoman officials wrote memoranda outlining plans for ending corruption, increasing revenues, revitalizing the army, and regaining control of the provinces.

(r. 1871–1876), the government went further still. It revamped the legal system along European lines, committed itself to guaranteeing the rights of the sultan's Christian and Jewish subjects, established provincial assemblies, and drew up a blueprint for a system of public education. Toward the end of the Tanzimat era, the concept of reform was expanded to include constitutionalism and parliamentary government. In 1876 progressive government ministers convinced the newly installed Abdulhamid II to accept a constitution with provisions for cabinet government and a parliament but to no avail. In 1878 Abdulhamid suspended the constitution and ruled as an autocrat until 1908.

In its different stages Ottoman reform was consistently supported by the sultans, some of whom acted decisively against conservative opponents. Mahmud II, for example, knowing that the Janissary corps and the Islamic clergy had undercut Selim III's reforms, crushed and disbanded the Janissaries in 1828. He and his successors found ways to weaken the clerical establishment by limiting its role in law and education. Even the autocratic Abdulhamid II fully embraced the Tanzimat program of educational reform and economic development.

The concept of reform underwent a similar evolution in China, but the process took place in just a few decades rather than over a century. In 1898 Emperor Guangzhu went beyond self-strengthening when in three months he issued dozens of decrees that committed his government to deemphasizing the importance of Confucian studies for the civil service examinations, streamlining administrative procedures, establishing technical and engineering schools, and promoting economic development by stimulating industry and commerce and encouraging farmers to grow crops for export. The emperor's program was scuttled by conservative opponents, but in the early 1900s reformers pushed for even more radical changes, some of which were implemented. They abolished the civil service examination system; established new ministries of education, police, and commerce; reformed the penal code; introduced budgetary planning; and established a program for a transition to constitutional government.

Although Chinese reformers accomplished a great deal, ultimately they failed to provide China with the economic and military weapons to stand up to Japan and the Western powers; they also failed to save the dynasty and China's Confucian tradition. By the 1890s many Chinese, stirred by nationalism and inspired by ideologies of constitutionalism and liberalism, were convinced that even the most vigorous reforms could not revive China's fortunes. A clean break with the past—revolution—was needed. The revolution came in 1911 when an army mutiny in central China spread to other provinces and led to the abdication of the last emperor in February 1912. After more than 2,000 years of imperial rule, China now became a republic.

The Ottoman empire also experienced political upheaval in the early 1900s. In 1908 the Young Turks, led by Turkish-speaking army officers, took advantage of army mutinies and popular disturbances to pressure Sultan Abdulhamid II to reinstate the Constitution of 1876 in 1908 and force him to resign in 1909. He was replaced by Mehmed V, Abdulhamid's 65-year old younger brother, who had never showed the

slightest interest in public affairs. It was now left to the Young Turks to guide the Ottoman empire through the perils of World War I and its aftermath.

Like Persia, the Ottoman empire, China, and Thailand, Japan faced foreign threats and internal tensions in the nineteenth century and, like these other states, managed to remain independent. Japan did so, however, without foreign spheres of influence, and losses of territory. Rather than becoming a victim of imperialism, Japan itself became an imperialist power.

Since the early 1600s Japan had been governed by members of the Tokugawa dynasty, who as shoguns ruled on behalf of the ceremonial and politically powerless emperors. Under their rule Japan experienced 250 years of peace and economic expansion, but by the early 1800s disenchantment was growing. The shoguns had provided no meaningful response to problems of rural discontent, famines, samurai indebtedness, higher taxes, conflicts between daimyo and the shogunal administration, and foreign pressures to end Japan's seclusion policy. Then in July 1853 Commodore Matthew Perry entered Edo (present-day Tokyo) Harbor with eight ships and demanded on behalf of American president Millard Fillmore that Japan open its ports to foreign trade and accept the presence of an American consul. In early 1854 the shogun acquiesced, and by 1858 he had signed commercial treaties with the major European powers. Perceived as a humiliation and a threat, these events further discredited the shogun and inspired support for a radical restructuring of Japanese politics in which the emperor would resume political authority. Tensions grew in the 1860s and came to a head in early 1868 when forces led by the Satsuma and Choshu clans deposed the shogun and replaced him with the 14-year-old Emperor Mutsuhito. The new era of Meiji ("Enlightened Rule") had begun.

Although the events of 1867-1868 theoretically restored the emperor to power, decisions during the Meiji era were made by a small group of ministers devoted to the spirit of their mottoes: "rich country, strong army" and "civilization and enlightenment." They achieved breathtaking results. Centrally controlled prefectures and municipalities replaced the approximately 250 semiautonomous daimyo domains. All taxes, to be paid in money rather than grain, went directly to the central administration. The daimyo and samurai lost their privileges, and all class distinctions relating to dress, marriage, travel, and occupation were abolished. A ministry of education, founded in 1871, established a national system of schools and universities in which foreign languages, mathematics, science, and other Western subjects were taught in addition to Japanese and Chinese literature and history. The government worked with former samurai, merchants, and even men of peasant backgrounds to open mines, construct factories, build shipyards and arsenals, and create nationwide railway, telegraph, postal, and banking systems. The Meiji

Then in July 1853 Commodore Matthew Perry entered Edo (present-day Tokyo) Harbor with eight ships and demanded on behalf of American president Millard Fillmore that Japan open its ports to foreign trade and accept the presence of an American consul.

leaders' willingness to borrow from the West is perhaps best illustrated by the Constitution in 1889, which called for a bicameral parliament, an all-male propertied electorate, and the guarantee of freedom of religion, speech, public assembly, and the press.

All these policies had the objective of strengthening Japan to fend off the West and earn the West's respect. This meant building a strong army and navy. Along these lines, one of the first acts of the Meiji leadership was to abolish private daimyo armies and replace them with a national conscript army equipped with modern weapons and led by officers schooled in European methods of training and strategy. Their success can be measured by the Japanese victories over China and Russia and the winning of an empire in Korea, Taiwan, and southern Manchuria.

Many factors contributed to the success of the Meiji reformers. Japan's relatively small size and homogeneity made it easier to push through radical changes than in a giant empire like China or the religiously and ethnically diverse Ottoman empire. Also, the country's high literacy rate and well-developed commercial system prepared it well for the changes introduced after 1868. Japan's tradition of borrowing from foreigners (Confucianism and Buddhism, for example) made it easier to learn from the West. Furthermore, once in power, the Meiji leaders faced less interference from foreign powers, with the United States recovering from its civil war and the Europeans focused on China. Most importantly, the Meiji leaders were able to draw on the support of the Japanese people, who were committed to avoiding India's and China's fate at all costs. Nurtured by the educational system and reinforced by the military training experienced by millions of Japanese men, nationalism was a powerful force driving the Japanese achievement.

The End of an Era

With the benefit of hindsight, we can now see that the world in the early twentieth century once more was on the brink of momentous changes, just as it had been in the late eighteenth century when the Industrial Age was beginning, France and the Americas were experiencing revolutions, and Great Britain was pushing into India. In the early 1900s, Ottoman, Persian, and Chinese revolutions showed the determination of Asian peoples to break free from ancient traditions. The transformation of Japan and its victories over China and Russia showed that industrialization and military modernization, along with all the political and social changes that made them possible, were attainable by non-Westerners. Resistance to colonialism was becoming stronger. Meanwhile in Europe, nationalism intensified, armies continued to swell, and one diplomatic crisis followed another until the summer of 1914, when diplomacy failed and the generals took over. What everyone expected to be a short war lasted four years, with unimaginable costs. A new era of transformation was about to begin.

—James H. Overfield

Environment and Population

As long as human beings have walked the earth they have changed the environments in which they lived. Between 1750 and 1914, more human beings walked the earth than ever before and did so with new capabilities, needs, and ambitions. As a result, they brought about environmental changes that were more rapid and profound than in any previous period of human history. Depending on their circumstances, human beings responded to these changes in different ways. Many were apathetic or unconcerned, some were enthusiastic, and a few, convinced that humans had reached a turning point in their relationship with the world in which they lived, were apprehensive.

Any discussion of environmental change between 1750 and 1914 must begin with population growth. Around 10,000 BCE when the Paleolithic era was reaching its end, approximately 6 million humans lived on earth, an increase from the several hundred thousand humans in 40,000 BCE. Over the next 10,000 years, when agriculture spread from Mesopotamia to the rest of the world, the human population increased to 250 million, reflecting an average annual rate of growth of .4 per 1,000, or a doubling every 2,000 years. A slightly higher growth rate of .6 per 1,000 resulted in a population of 750 million to 800 million in 1750. Then, in just 150 years world population more than doubled, soaring to just over 1.6 billion by 1900. Increases were most rapid in the Americas, where the population underwent a ninefold increase, and in Europe, where the population tripled. Of the world's major regions, Africa experienced the smallest population increase, but even so, the number of Africans increased from an estimated 104 million in 1750 to 138 million in 1900. Between 1750 and 1900 a population explosion had begun, setting the stage for even more rapid population increases in the twentieth century.

The world's population grew despite the loss of lives to epidemics and famines. As more and more humans crowded into large cities, millions died in cholera and typhus epidemics caused by polluted water and poor sanitation, and as Pacific islanders came into contact with European explorers and traders, hundreds of thousands, perhaps more, died from smallpox, influenza, and other Eurasian diseases for which they had no immunity. In many parts of the world famines took an enormous toll. More than 1 million died in Ireland between 1845 and 1849 as a result of potato crop failures. India suffered no fewer than six major famines between 1770 and 1902, with a loss of life in the neighborhood of 20 million people. The Indian famines of the 1870s and 1890s were both the result of droughts caused by a concentration of El Niño events that also affected China, the Middle East, northern Africa, and Brazil.

Catastrophic famines hit northeastern and southern Africa when cattle herds were infected by the Rinderpest virus after diseased cattle from India were introduced to Eritrea in the late 1880s.

Despite such losses, world population surged. The reasons include improvements in sewage and water systems, campaigns against certain diseases such as smallpox through the use of vaccinations, and the decline of other diseases such as the bubonic plague for reasons that are not entirely clear. By far, however, the most important cause was the increased availability of inexpensive and nutritious food. Both a cause and a result of the world's population growth, increased agricultural production resulted mainly from the allocation of more land to farming and raising animals. This was accomplished by cutting down forests, increasing irrigation, reclaiming land from the sea, and, most importantly, opening up of vast territories in Argentina, Brazil, Uruguay, Canada, the United States, Australia, and New Zealand to farming and grazing. On new and old farmland, productivity increased because of the use of natural and man-made fertilizers and the introduction of farm machinery, ranging from the steel plow and McCormick's reaper to pea threshers, manure spreaders, milking machines, and a host of other devices. Finally, revolutionary changes in transportation made food more available. Railroads and steamships provided inexpensive transportation for moving grains across continents and oceans, and when ships and railroad cars were outfitted with compressed-gas coolers, they also could carry beef and mutton. All of these changes increased the world's food supply, which in turn resulted in lower mortality rates, especially among infants and children.

Of equal importance to population growth in terms of its environmental impact was industrialization, a process which by 1914 was concentrated in just a few parts of the world but nonetheless affected the whole globe. The most immediate effect of industrialization was to accelerate urbanization. City growth already was taking place in many parts of the world on the eve of the Industrial Revolution. Although the size of some cities, such as Paris, Edo, and Istanbul, remained fairly constant in the eighteenth century, the populations of others soared. Between 1700 and 1800, Beijing grew from 650,000 to 1.1 million people, Guangzhou grew from 200,000 to 800,000 people, and London grew from 550,000 to 959,000 people. By 1800, Japan had ten cities with more than 50,000 people, with the largest, Edo, numbering 685,000.

Industrialization was not the only cause of city growth. Cities also grew because of the overall increase in the world's population, changes in international migration patterns, and the exodus from rural to urban areas in the face of declining economic prospects for peasants and small farmers. To cite one example, Mexico City, where little industrialization took place, grew from 128,000 in 1800 to approximately 500,000 in 1900. But industrial cities experienced the most spectacular growth. In England's industrialized heartland, from 1800 to 1900 Liverpool grew from 77,000 to 400,000 people, Birmingham grew from 73,000 to 250,000 people, Leeds grew from 53,000 to 172,000 people, and Manchester grew from 25,000 to 367,000 people. London, the seat of government and a center for trade, finance, and manufacturing, had

a population of 6.5 million by 1900, a more than sixfold increase from the start of the nineteenth century. By 1900 the United States had 19 cities with populations over 200,000; its largest city, New York, had a population of just short of 3.5 million, compared to 60,500 in 1800.

The world's growing cities all faced unprecedented environmental challenges. The time-honored practice of dumping garbage and human and animal wastes into a river and waiting for them to be carried downstream was an imperfect solution to an ancient problem when a city had had 40,000 or 50,000 inhabitants but spelled catastrophe when a city had ten times that number.

London's abuse of the Thames River is a prime example of the inadequacy of old methods. By midcentury, the mixture of organic waste and industrial chemicals in the Thames had killed all the river's fish and sea mammals and produced odors so noisome that the "Big Stink" of 1858

By midcentury, the mixture of organic waste and industrial chemicals in the Thames had killed all the river's fish and sea mammals and produced odors so noisome that the "Big Stink" of 1858 forced Parliament to adjourn for a week.

forced Parliament to adjourn for a week. Nonetheless, Londoners continued to pump much of their domestic water supply from the Thames, a practice that led to the cholera epidemics of 1832, 1848, and 1849.

Other urban environmental problems were unique to the industrial age. Workers and their families were jammed into overcrowded neighborhoods near the factories where they worked, and everyone suffered from the noise pollution constantly generated by machinery, trains, whistles, and ever-increasing numbers of human beings. In cities where coal was used for domestic heating in addition to providing power for factories, smoke and soot blackened the facades of buildings; killed trees; attacked stone statues and facades; exacerbated diseases of the nose, throat, and lungs; and interfered with everyday domestic chores such as drying laundry and keeping floors and furniture clean.

Industrialization's impact spread far beyond urban centers. In areas surrounding industrial cities, open land and farms disappeared as cities expanded, suburbs grew, and railroad lines were extended. Winds blew contaminated air over nearby regions, and rivers carried urban sewage and chemicals to downstream towns. To meet the enormous demand for coal, countless new mines were opened not only in Europe and the United States but also in nonindustrial regions such as Sumatra, Colombia, and parts of southern Africa. Tin mining was introduced to Bolivia and expanded in Malaya, and copper mines were opened in South America, Africa, and Japan. Mining, especially when combined with smelting operations, frequently had devastating effects. The expansion of the Ashio copper mine, situated in a valley just 60 miles (97 kilometers) from Tokyo, stripped nearby hillsides of trees (used for railroad ties, mining supports, lumber, and fuel) and poured ever greater amounts of smoke laden with sulfuric acid into the air. Deforestation contributed to a series of massive floods in which waters from the Watarese River, polluted with arsenic, copper sulfate, and other heavy metals, ruined many thousands of acres of farmland and caused hundreds of deaths. Deforestation in the environs of the Ashio mine was just one

example of a worldwide phenomenon. Brazil, India, Burma (present-day Myanmar), European Russia, Australia, hundreds of Pacific islands, and North America all experienced substantial forest losses in the 1800s.

The industrialized world's need for food, fiber, and raw materials changed patterns of land use and agriculture in every part of the world. Egypt, India, and parts of sub-Saharan Africa increased the acreage devoted to growing cotton rather than foodstuffs to meet the demand of the textile industry; India increased its production of jute and hemp for rope making; and western Africa became a major exporter of palm oil. By the early twentieth century, new environmental pressures resulted from the increased use of petroleum as an energy source. At a time when automobile use was still in its infancy, commercial oil wells were being drilled in Russia, Romania, Pennsylvania, Texas, California, Canada, Sumatra, Persia, Peru, Mexico, and Venezuela.

The exchange of goods between the world's industrialized and nonindustrialized regions was just one part of another development with significant environmental implications: the increased interactions among the world's peoples as a result of exploration, migration, and colonialism. Although the "era of exploration" is a term usually identified with the fifteenth and sixteenth centuries, it also applies to the eighteenth and nineteenth centuries, when Europeans explored and mapped much of Africa's interior, parts of South America, the Arctic and Antarctic regions, the interior of Australia, and thousands of Pacific islands.

Of all these regions, Australia, New Zealand, and the Pacific islands experienced the most severe environmental consequences. By 1750, only a small number of Pacific islands had been sighted and visited by European mariners. This changed in the late eighteenth century, when the English and French sent dozens of expeditions to the Pacific. The most important by far were the three expeditions led by the Englishman Captain James Cook between 1768 and 1779. In the wake of the explorers, European and American whalers, sealers, and traders followed, and the results were catastrophic. Because of its isolation from Eurasian disease pools, the region experienced epidemics of smallpox, influenza, and a host of other diseases. Further population losses took place as a result of social disruption, forced labor, and outright enslavement. Not just humans suffered. European and American seal hunting began on New Zealand's South Island and the southern shores of Australia in the late eighteenth century and ended around 1830 because the seals had been killed off. Whaling in the Pacific also began in the late 1700s and peaked in the 1830s and 1840s, when many hundreds of whaling ships sailed every year. Hundreds of thousands of whales were killed and butchered, and as a result of declining harvests, the industry slowly shrunk beginning in the 1850s. During their visits to Pacific islands for food and repairs, whalers and sealers were among the first Europeans to introduce alien species to the region including mosquitoes, which served as vectors for new diseases, and new types of rats, which multiplied prodigiously and preyed on birds, crops, and wild plants. Other species of plants and animals, introduced to the region for their perceived benefits, had unintended and often damaging consequences.

On many islands, pigs and goats escaped to the wild, where they multiplied and devastated native plants.

European colonialism and migration also had important environmental consequences in other parts of the world. Colonial administrators in Asia and Africa were committed to programs of economic development, both to make the colonies self-supporting and to generate profits for European businesses. They sponsored railway construction, irrigation projects, logging and mining and prodded (in some cases required) native farmers to grow commercially valuable items such as coffee and cotton rather than food crops.

All of these undertakings had negative environmental consequences. The European colonial presence in India and Africa threatened wildlife as a result of overhunting. It is difficult to even guess how many animals were shot or trapped for sport by European and American hunters, but we do know that after serving as president,

Theodore Roosevelt went on a year-long African safari in 1909–1910 in which he alone killed close to 350 animals, including 9 lions, 8 elephants, 6 monkeys, 15 zebras, and 1 crocodile.

Theodore Roosevelt went on a year-long African safari in 1909–1910 in which he alone killed close to 350 animals, including 9 lions, 8 elephants, 6 monkeys, 15 zebras, and 1 crocodile. We also know that by the time of the former president's African adventure, concern about the declining numbers of species in Africa and India had already resulted in the adoption of game controls by colonial administrators, which among other things banned the killing of young females, restricted hunting to certain times a year, and required hunting licenses.

Migration in its various forms also had significant environmental effects in the 1800s. In Africa, English, Afrikaners, and German farmers introduced new conceptions of private property and built fences to control the movement of Africans' cattle herds. English settlers in New Zealand and Australia imported many dozens of English animals and plants to their new homelands to remind them of home. Garden plants such as blackberries and Scotch thistles flourished in Australia's mild winters and turned into weeds that choked indigenous species. Blueberries also offered protection and food for Australia's booming population of wild rabbits, which devastated Australian and New Zealand landscapes after having been introduced by English settlers. Other new animals were introduced for commercial reasons. A stunning example is the increase in the size of the New Zealand sheep herd from 23,000 in 1851 to over 20 million in 1901. To accommodate them, in just one decade, from 1890 to 1900, 10 million acres (over 4 million hectares) of forests, 27 percent of New Zealand's forest cover, were converted to grassland.

The expansion of the United States provides the best example of how the movement of peoples, when combined with population growth, transformed nineteenth-century landscapes. In 1790 the United States consisted of 13 states on the Atlantic coast with a population of just fewer than 4 million people; in 1910 it consisted of 46 states (Arizona and New Mexico became states in 1912) stretching to the Pacific with a population of more than 92 million people. As the

frontier pushed inexorably westward, native peoples were killed or displaced, cities were founded, railroad lines were laid, grasslands were transformed into farms, millions of acres of forest land were lost, and certain species such as the buffalo were hunted to near extinction. In 1890 the director of the U.S. census declared that the American frontier was closed, and three years later in his famous book *The Significance of the Frontier in American History*, the American historian Frederick Jackson Turner argued that this meant the end of a crucial epoch in American history.

By the time Turner wrote his book, many others had also begun to sense that a turning point had been reached in terms of humankind's relationship to the environment. Calls to end or at least mitigate the damage caused by human activities began to be heard. Some steps had already been taken. During the nineteenth century many cities responded to the problems caused by rapid growth by building or extending sewers and water systems. Others introduced ordinances for limiting smoke emissions, noise, and the release of industrial wastes and chemicals into waterways. By midcentury, German methods of forest management, whose roots go back to the eighteenth century, had been embraced by many German states and also were being adopted in other parts of the world, notably the United States, Japan, and colonial India. The first examples of mass action over environmental issues occurred. After flooding caused by practices at the Ashio copper mine destroyed 88 villages and killed 300 people in 1896, thousands of aggrieved Japanese peasants organized a protest in Tokyo, where they battled police and won the support of a number of prominent politicians and intellectuals. Two years later the government issued a set of rules for the operation of the giant copper mine that gradually returned the Watarese River floodplain to a reasonable level of health.

Of more lasting significance was the beginning of organized environmental movements in the United States and Europe. Although modern environmentalism is sometimes traced back to Benjamin Franklin's successful efforts in 1739 to have the Pennsylvania colonial legislature ban the dumping of wastes in the Schuylkill River and remove tanneries from Philadelphia's business district, its more immediate origins are in the mid-nineteenth century. The University of Vermont professor George Perkins Marsh revolutionized environmental thought in his book *Man and Nature* (first published in 1864), in which he drew on examples ranging from ancient history to recent developments in Vermont to argue that out of ignorance, greed, and lassitude, human beings had brought ruination to nature in the form of deforestation, species extinction, avalanches, desertification, and the destruction of beauty. He wrote that "Man is everywhere a disturbing agent. Wherever he plants his foot, the harmonies of nature are turned to discord." He called on humanity to adopt a new ethos based on striving for balance between human needs on the one hand and human responsibility to nature on the other. Marsh's book sold 100,000 copies in just a few months, and his ideas gained resonance among individuals on both sides of the Atlantic who backed government policies and joined organizations dedicated

to conservation, species protection, and the preservation of wilderness. In the first half of the twentieth century, in the midst of two world wars and economic depression, concern over the human impact on the environment waned, only to revive and grow from the 1960s onward.

■ Introduction: Weather and Climate

In an age of scientific advance, industrial progress, and dazzling technological achievements, much that occurred between 1750 and 1914 resulted from something no human could control, the weather. Few areas of the world escaped weather-related famines, floods, or epidemics. In the 1810s volcanic activity, above all the eruption of Mount Tambora in 1816 on a small Indonesian island, filled the skies with volcanic ash, caused a variety of global weather anomalies (especially a fall in temperatures) that led to widespread famine, and contributed to typhus and plague epidemics in Europe and the worldwide cholera pandemic that began in India in 1816 and 1817. In the second half of the nineteenth century a series of El Niño events resulted in drought-caused famines in lands stretching from Southeast Asia across Africa and all the way to eastern South America. India was hit especially hard. The failure of the monsoon rains in 1866, 1869, 1876–1878, 1896–1897, and 1899–1900 led to famines that killed approximately 13 million people. To China's sorrow, periods of famine in the 1850s and the late 1870s, mainly caused by drought, were followed in 1887 by abnormally high rainfall in the Huang He (Yellow) River's catch basin. The resulting flood resulted in the deaths of between 900,000 and 2 million people. Weather also affected politics and war. A string of dry summers, a freakish hailstorm in July 1788, and a bitterly cold winter in 1788–1799 ruined much of the French grain crop and caused extreme hardship among the rural and urban poor, who on the eve of the French Revolution became further alienated from the king, who was blamed for doing nothing, and the

nobility, who were blamed for hoarding grain. Two decades later the onset of a Russian winter, no worse than most, contributed to the devastating failure of Napoleon's invasion of Russia in 1812–1813.

Was the weather between 1750 and 1914 subject to more droughts, floods, storms, and extreme temperature fluctuations than previous eras? Did broad changes in overall climatic patterns occur? Such questions are difficult to answer given the paucity of evidence. Instruments for making meteorological measurements—the thermometer, barometer, hygrometer (for measuring humidity), rain gauge, and anemometer (for measuring wind strength and direction)—all had been invented or refined in Europe in the seventeenth century, but efforts of various learned societies in the 1700s and early 1800s to organize the systematic collection of weather data in different parts of the world generated only a small amount of usable information, mainly pertaining to Europe and eastern North America. In the absence of statistical data, historians of climate rely on information derived from written sources such as diaries, individual weather logs, and agricultural records and from the analysis of grain prices, tree rings, and year layers in ice sheets, glaciers, and lakebed sediment.

Using these sources of information, many historians of climate place the period from 1750 to 1914 at the close of the Little Ice Age, defined as a long period of colder temperatures dating back to the 1300s and early 1400s, which followed a period of milder temperatures known as the Medieval Warm Period. There is

substantial evidence to support such a periodization scheme for Europe, eastern North America, and much of China, but at this point experts disagree over how useful such concepts are for the world as a whole. The scientific panel that prepared the 2001 report of the Intergovernmental Panel on Climate Change, established in 1988 under the auspices of the United Nations to investigate the impact of human activity on climate, expressed extreme skepticism about the concepts. The panel wrote that “The conventional terms of ‘Little Ice Age’ and ‘Medieval Warm Period’ appear to have limited utility in describing trends in hemispheric or global mean temperature changes in past centuries. With the more widespread . . . reconstructions of temperature change now available, the spatial and temporal character of these putative climate epochs can be reassessed. In the absence of information it is questionable how much the rest of the world experienced similar patterns of climate.”

People who lived in the nineteenth century did not consider themselves to be living through a major period of climate change, even though 1860 is often mentioned by historians as the end point of the Little Ice Age. The copious records generated by national weather services, which were founded in the United States and most European states in the nineteenth century, show no evidence to suggest that temperatures were beginning to permanently trend upward in the 1800s. They show extreme cold temperatures in the 1810s; gradual warming in the 1820s, 1830s, and 1840s (but with at least seven bitterly cold winters); colder than warmer temperatures in the late 1850s and 1860s, when glaciers began to recede; and finally, beginning with the late 1870s, a period of extended cold winters and wet summers lasting until the end of the century.

Paradoxically, although nineteenth-century weather was erratic and inconsistent, long-term patterns of climate change became a matter of intense interest among scientists. The reason was the mounting body of evidence that in the earth’s distant past low temperatures had caused one or perhaps several “ice ages” and that at other times warmer temperatures and abundant rainfall had turned a good part of the globe into a giant rain forest. Once such theories gained general acceptance by the 1870s, scientists began to

offer numerous explanations for climate fluctuations, including changes in the earth’s orbit, the amount of sunspot activity, the height and shape of landmasses, ocean currents, solar output, and volcanic activity. The work of the British scientist John Tyndall (1820–1893) suggested another possibility: that variation in the amount of atmospheric water vapor, hydrocarbons, and carbon dioxide, all capable of preventing the escape of the earth’s heat into space, were the underlying cause of climate change. In the 1890s and early 1900s the research of the Swedish scientist Svante Arrhenius (1859–1927) focused specifically on the role of atmospheric carbon dioxide, which he believed varied over time as a result of chemical changes in the earth’s crust. In 1904, however, he published a paper in which he suggested that human activity, specifically the burning of coal and other fossil fuels, increased the amount of atmospheric carbon dioxide. This, he speculated, would be a good thing. Its warming effect would make the earth’s climate less erratic and increase agricultural production. Arrhenius was writing at the end of two decades of harsh European winters and before the onset of global warming in the twentieth century, so his optimism was not unreasonable.

—James H. Overfield

Environmental Change and Disease Transmission

The types of diseases that a population is exposed to are heavily influenced by that population’s environment. Some diseases require specific temperature or moisture conditions to survive. Other diseases are only likely to be passed on to people if certain animals that carry the disease are present as in the case of malaria, which is transmitted by mosquitoes. Other diseases are endemic to certain populations and are only likely to become epidemics when they infect new populations who lack a genetic immunity to them as in the case of smallpox, which was endemic to Europe but devastated Native American populations in the fifteenth and sixteenth centuries. Still other diseases are only likely to be transmitted when population densities are high.

Beginning in the mid-seventeenth century, the ecological and population dynamics of the

globe began to alter significantly. By around 1750 massive population growth had occurred in Western Europe and China. In those regions of the Americas where European colonization was most settled, Native American population rates declined to their lowest points, while the populations of European colonists and imported African slaves continued to grow. This also occurred in other regions of the world where European colonizers encountered populations that had previously lived in relative isolation, such as the islands of the Pacific Ocean.

At the time that population dynamics were changing, so too were the conditions in which many of these populations lived. In Western Europe intense industrialization and urbanization radically altered the lifestyles and population densities of many people. In North America the eastern seaboard was also becoming increasingly urbanized, while white settlers on the frontier continued to expand westward in increasingly large numbers after 1812. Meanwhile, enslaved Africans, forcibly exported to North America, South America, the Caribbean islands, and elsewhere, also found themselves in new environments. Voluntary transplants to new environments throughout the world included European colonists, traders, and soldiers, all of whom relocated to regions of the Americas, Africa, Asia, and the Middle East, permanently and temporarily, to live and to work.

One result of this massive transformation of the world's population and environmental dynamics was the establishment of new routes for spreading disease and epidemics. Another result was the introduction of unfamiliar diseases to populations who lacked the genetic immunity, acquired antibodies, or knowledge required to resist or avoid them. The first of these was perhaps most dramatically demonstrated in the years and decades following 1817 when a series of deadly cholera epidemics spread from India throughout Europe and Asia.

Cholera, a disease spread by fecal contamination of drinking water, was endemic to the region along the lower Ganges River. Periodically, festivals or pilgrimages to this region would carry outbreaks of cholera to areas throughout or around India. During one 1817 cholera epidemic, however, a new element was introduced.

➤ SMALLPOX INOCULATION

By the time it was introduced to Europe, smallpox inoculation had been practiced for centuries in many regions of Asia, Africa, and the Middle East. These populations tried to protect themselves against smallpox by exposing themselves to small amounts of the disease as children. When successful, this practice resulted in a mild nonfatal infection that conferred a lifelong immunity. When unsuccessful, however, it could result in death from smallpox infection.

In 1717, Lady Mary Wortley Montague, an English aristocrat who had survived smallpox as a child, traveled to Turkey. While there, she witnessed firsthand the practice of smallpox inoculation. Impressed by this procedure, she worked to bring the practice to Europe but met with limited success. Few of those who had not already been exposed to smallpox as children were willing to intentionally risk infection, and many were skeptical about the efficacy of the practice.

Then, in 1796, country physician Edward Jenner developed a new approach to smallpox inoculation. Rather than using smallpox, he offered a vaccine made from the related cowpox virus, producing the same immunity while eliminating the risk. Despite continued resistance, this improvement did much to help spread the practice of vaccination and reduce smallpox infection. In 1980, the World Health Organization declared smallpox to have been entirely eradicated from the world's population.

—Skylar Harris

British ships and troops were also present and, as a result, enlarged the epidemic along two main routes. The first route was northward, where the British military had been fighting a series of battles for colonization along the northern borders of India. New troops arriving from the south carried the cholera epidemic northward, where it spread further to opposing Nepalese and Afghan forces.

The second route was by sea and was much more extensive. In one direction, it reached the islands and mainland of Southeast Asia, China, and Japan. Sailing westward, the epidemic was spread to southern Arabia, where slave traders then carried it to the east coast of Africa. Ships

also brought the epidemic into the Persian Gulf, where it spread northward into southeastern Europe, around the Caspian Sea. Repeats of this pattern throughout the 1830s would make cholera a disease with global presence, reaching Western Europe and the Americas early in that decade with predictably disastrous results.

As a result of increased travel between distant areas and growing population density, the decades between 1750 and 1820 also saw other smaller epidemics spread in regions throughout the world. In 1750 unsanitary conditions led to a typhus epidemic in London that spread quickly through the densely populated, poorly maintained city, killing thousands. In 1793 a ship from the Caribbean arrived in Philadelphia carrying passengers infected with yellow fever. As a result of a particularly hot, dry summer, Philadelphia's waters were unusually shallow and warm, providing a perfect breeding ground for large numbers of mosquitoes. The importation of yellow fever combined with the increase in the mosquito population to introduce an epidemic that killed 2,000 of Philadelphia's 55,000 residents. In 1771 an outbreak of the plague began in the agricultural regions of eastern Russia where it then spread to cities, killing tens of thousands of people.

While many of the changes that occurred during this time period served to facilitate the spread of disease or the introduction of new diseases, some changes helped to combat disease. Some of these changes had to do with living standards. While the largely agricultural regions of China and eastern Asia continued to be subject to periodic epidemics of varying types, as agricultural productivity increased and political stability was maintained the diseases that these epidemics spread became less likely to cause fatalities and more likely to become common but survivable maladies.

Other advances in decreasing the incidence and fatality rate of disease came from advances in medical techniques. American colonists and settlers living in remote regions of North America were vulnerable to epidemics of smallpox. As a result of their isolation, it was unlikely that they would have been exposed to smallpox as children, and thus they were more likely to die from the disease than were inhabitants of regions where smallpox was endemic. However,

many of these settlers were able to protect themselves with the risky but effective practice of smallpox inoculation, a practice that had been popular throughout Asia, Africa, and the Middle East for centuries before being imported to Europe through Turkey in the early eighteenth century. This technique was made safer and more popular after 1796 when the technique of using inoculations from cowpox was developed, as inoculations from cowpox produced the same level of immunity without the risk because cowpox is not dangerous to humans.

Other advances in the fight against disease were the result of changes to the environment. Through both intentional and unintentional means, the incidence of disease in some areas declined as a result of environmental changes that reduced or eliminated disease habitats. As Western Europe's agricultural practices shifted increasingly toward large-scale cattle farming, the incidence of malaria decreased or even disappeared in those regions. This was because mosquitoes preferred to feed on cattle, and the parasite that mosquitoes can carry that causes malaria does not survive in cattle. As a result, the chain of malaria transmission was broken, dramatically decreasing its incidence.

Other decreases in disease transmission due to environmental changes were more intentional. Beginning in the early 1750s, the need for attention to public health and city planning in the form of sanitation and water supplies began to receive increasing amounts of attention. By the end of the century many major cities had begun implementing the reforms needed to gradually provide clean drinking water and the safe disposal of waste. While these early systems were frequently flawed or incomplete and were subject to failure, they proved increasingly effective in reducing disease, as contaminated drinking water, along with unsanitary conditions that encouraged rodent infestations, had long been a major cause of many common and serious epidemics such as cholera and typhoid as well as a host of other gastrointestinal disorders.

In parts of the world where these improvements were not made, however, these diseases and others continued to be a serious problem for local inhabitants and new arrivals. In warm climates in particular the lack of cold seasons

meant that mosquitoes were present year-round. While in other regions cold months typically put an end to mosquito-born diseases such as malaria and yellow fever, these ailments were common year-round in warm climates, and it would not be until later in the nineteenth century that the connection between these diseases and mosquitoes would be made.

Theories of Climate Change

Discussion of climate change and its causes long predates the twentieth century. Most European intellectuals before 1800 believed that temperatures had increased since ancient times, a change they attributed to the conversion of forests to pastures and fields. Many thinkers also were convinced that climate affected human character and helped determine the types of societies in which various populations lived. Europeans believed, for example, that North America's cold and stormy weather explained the "backwardness" of America's native peoples and doomed its European settlers to a low level of culture and intellect. A number of American writers, including Thomas Jefferson, countered such arguments by asserting that the continent's climate was warming and would continue to warm as forests gave way to farmland. Such views were rejected by Noah Webster, the noted American lexicographer, who in his essay "On the Supposed Change in the Temperature of Winter" (first delivered as a lecture in 1799) denied both Jefferson's claim and also the theory that Europe's climate had warmed since antiquity.

In the nineteenth century, theories of climate change were shaped by three developments. First, a number of government agencies, scientific organizations, and learned societies began collecting and publishing data on temperatures, winds, and barometric pressure. Students of climate were no longer forced to rely solely on literary references and memory. Second, the study of climate became more scientific. Students of climate drew on insights from physics, chemistry, astronomy, and geology, and increasing numbers sought to test their theories through experiments and data analysis. Finally, the study of climate was forever changed when from the mid-nineteenth century onward it became generally accepted that the earth had experienced not just one but several ice ages followed by eras of global warming. Such massive changes could not be explained by the clearing of forests.

During the 1800s, many theories were advanced to explain the earth's fluctuating climate. They include theories based on the circulation of ocean currents, sunspot cycles, the inclination of the earth's axis and the earth's orbit, solar radiation, wind patterns, the drifting of global landmasses, mountain building, and volcanic activity. In addition, a small number of scientists proposed that changes in the atmosphere were determinants of global temperatures.

This role of the atmosphere was first suggested by the French scientist Joseph Fourier (1768–1830) in the 1820s. Fourier proposed that the earth received heat mainly from the sun but also from its interior and the stars. He further argued that the earth radiated much of the sun's heat back into space in the form of "invisible heat rays," thereby preventing the earth from becoming as hot as the sun itself. Not all the heat escaped, however. If all the heat radiated back into space, he calculated that the earth would have temperatures well below freezing. To Fourier, this was averted because the atmosphere intercepted and absorbed heat radiated from earth and prevented its escape into space, just as glass plates can slow the escape of heat from an enclosed space.

John Tyndall (1820–1893), a many-sided Irish scientist famous for his studies of crystals, in the 1850s turned his attention to the capacity of various gases to absorb heat. In 1859 he began

collecting gases in tubes to test their transparency to infrared radiation. He found that oxygen, nitrogen, and hydrogen let most of this radiation pass through with little absorption. Because air is mostly oxygen and nitrogen, Tyndall was ready to conclude that atmospheric gases had no role in heating or cooling the climate. But when he filled a tube with methane, he discovered that it absorbed more infrared radiation. Tyndall next tested carbon dioxide and ozone, finding that they too absorbed heat. Finally, he tested water vapor and found that it absorbed 80 times more heat than did oxygen and nitrogen. Tyndall thus provided a chemical explanation for the phenomenon described by Fourier.

Ensuing research built upon Tyndall's findings. In the 1890s two Swedish scientists, Svante Arrhenius (1859–1927), the 1903 Nobel Prize winner for his work on electrolytes, and Arvid Högbom (1857–1940) published papers on atmospheric carbon dioxide. In 1894 Högbom described all the processes that might affect the amount of carbon dioxide in the atmosphere. In addition to volcanic eruptions, the formation of limestone, the breakdown of silicates, the combustion of meteorites in the atmosphere, and the role of oceans, he discussed deforestation and coal burning. Although he estimated that in 1894 500 million tons of coal would be burned around the globe, this would increase the amount of carbon dioxide in the atmosphere only by .001 percent, an amount he considered insignificant. In his view, other factors had greater potential for bringing about the altered carbon dioxide levels that could cause major climate changes.

In 1896 Arrhenius calculated how relatively minor changes in the amount of carbon dioxide in the atmosphere would affect the earth's overall heat budget (the balance between incoming and outgoing heat). He estimated that were the concentration of carbon dioxide in the atmosphere to increase 2.5 to 3 times its current level, arctic temperatures would increase by 8 to 10 degrees Celsius. Conversely, if levels were to decrease by a third or a half, temperatures between the 40th and 50th parallels would decrease enough to set off another ice age. Arrhenius continued to write on climate and the carbon cycle for the next decade. In a popular work published in 1904 (an English translation

Worlds in the Making appeared in 1908), he more strongly asserted that burning fossil fuels might affect terrestrial temperatures. Noting that the annual amount of coal consumed had increased to 900 million tons in 1904, he suggested that over several centuries "the advances of industry" would slightly moderate temperatures. This did not alarm Arrhenius. To the contrary, "global warming" would benefit humankind by making the earth more productive and preventing the onset of another ice age.

In the first half of the twentieth century, debates about the causes and effects of climate change continued, and theories that centered on the role of atmospheric carbon dioxide went out of favor, only to be revived in the late 1930s by the work of G. S. Callendar and a growing awareness of rising temperatures across much of the globe.

El Niño-Southern Oscillation, 1870–1900

The El Niño-Southern Oscillation (ENSO) refers to year-to-year variations in sea surface temperatures, convective rainfall, surface air pressure, and atmospheric circulation that occur across the equatorial Pacific Ocean. The term "El Niño" was first used by Peruvian fishermen in the eighteenth century to describe the warming of the waters in the eastern Pacific that often was noticed around Christmastime (hence the term "El Niño," which means "the little boy" and refers to the Christ child). When the warm temperatures last for more than five months, this is referred to as an El Niño event and can have significant effects on world climate. The warming of waters in the eastern Pacific occurs when westerly blowing trade winds decrease, allowing warm

water from the Indian Ocean and the western Pacific to move east. This is accompanied by what is now called the Southern Oscillation, which during an El Niño event refers to a rise of air pressure over the Indian Ocean, Australia, China, and Indonesia and a fall in air pressure in the central and eastern Pacific and in northwestern South America. La Niña, meaning “little girl,” refers to the opposite conditions.

Current theory about the causes and effects of El Niño events can be traced back to the nineteenth century, when weather observatories across the globe provided for the first time a wealth of information on global patterns of rainfall, temperatures, and atmospheric pressure. In the 1870s a British meteorologist stationed in India, Henry Blanford, suggested that the failure of the monsoons in India was part of a general meteorological event affecting most of the Indo-Australasian region; he also hypothesized that fluctuations in atmospheric pressure were the cause. His hypothesis was confirmed in the 1920s by another British meteorologist working in India, Gilbert Walker, who coined the term “Southern Oscillation” to describe the periodic fluctuations in atmospheric pressure between the eastern and western tropical regions of the Pacific. Subsequent research linked these changes to changes in water temperature.

From the 1870s to the 1890s, the warming events associated with ENSO were uncharacteristically severe. The result was a series of so-called megadroughts and famines in parts of Africa, Eurasia, and South America. Drought and famine were reported in Egypt, China, India, Java, the Philippines, New Caledonia, Korea, Brazil, Russia, and southern and far northern Africa. There were three distinct periods of drought, the first occurring from 1876 to 1879, the second running from 1889 to 1891, and the third lasting from 1896 to 1902. Estimates suggest that as many as 50 million people may have died due to drought-related famine during these three decades. During the first drought, it is estimated that 9 million to 20 million died in China alone, 6 million to 10 million died in India, and nearly 1 million died in Brazil. During the second period of drought, Ethiopia and the Sudan each lost nearly one-third of their respective populations. And in the third period,

➤ THE GREAT PERSIAN FAMINE OF 1870–1871

The megadroughts of the 1870–1900 El Niño–Southern Oscillation (ENSO) cycle took a spectacular toll on Persia. In 1870 and 1871 the northern and eastern provinces did not receive any precipitation, wiping out crops on a large scale and bringing a famine with wide-ranging social consequences. The drought was followed by a sharp rise in grain prices, more than tripling the price of bread; this was followed by frequent and violent food riots. In addition to violence, there were reports of cannibalism. In the city of Qom, rumors spread that individuals from the city’s outskirts would lure women to their homes with the promise of a meal, only to kill and eat the women instead. There were reports of child abduction and of parents eating their own children. The result was a society nearly paralyzed by fear.

—Katherine J. Worboys

the drought stirred destructive epidemics of malaria, bubonic plague, dysentery, smallpox, and cholera in Asia and Africa.

The drought and famine events had significant political repercussions. It has been suggested (most strongly by American historian Mike Davis in his 2002 book *Late Victorian Holocausts: El Niño Famines and the Making of the Third World*) that with the populations in many parts of Asia and Africa severely weakened by drought and famine, imperialist nations were able to more easily conquer and control additional lands to extend their respective empires. Drought in Egypt, for example, contributed to the bankruptcy of the Egyptian government, which in turn invited more European interference in Egyptian affairs and ultimately the occupation of Egypt by the British in 1882. Famine in northern China and Korea paved the way for increased Japanese interference in Korean affairs and contributed to Japan’s victory over China in the Sino-Japanese War (1895). In southern Africa, drought enabled the Portuguese to extend their territorial holdings in Angola and weakened the Zulu in their struggles against the British. In several regions famine gave Europeans the opportunity to expropriate communal lands and tap new sources of plantation and mine

labor. The ENSO cycles of the 1870s through the 1890s thus contributed significantly to many of the intranational social and economic disparities still existing in the twenty-first century.

Climate, Weather, and the French Revolution

In an era of European climate history referred to as the Medieval Warm Period, from approximately 1000 CE to the early 1300s, northern, western, and southwestern France experienced moist, temperate airstreams from the Atlantic Ocean, which created a favorable environment for grain cultivation. Warmer streams off the Mediterranean produced conditions suitable for vineyards as well as olive and chestnut cultivation in the south and the southeast. In the early 1300s, average temperatures began to decline, and Europe entered into a period of colder weather that lasted until the nineteenth century. Within this Little Ice Age, temperatures fluctuated, with the coldest periods in the years following 1650, 1770, and 1850. The cold temperatures after 1770 had a direct bearing on the causes and events of the French Revolution.

For much of the eighteenth century, France experienced increases in agricultural productivity, rents, and land values. Prices remained strong because of the demands of France's growing population. Beginning in the late 1760s, however, grain-growing regions of France experienced a series of bad harvests, the worst of which occurred in 1775. In the Mediterranean regions, the wine crop failed in 1778, and a series

of volatile annual yields followed. With the decline in grain production, income for noble landowners fell. In response, many hired surveyors and estate agents to determine methods of increasing the grain yields and their income from their rural estates. The result was the reassertion of noble prerogatives that had fallen into disuse, such as the restrictions on the amount of common land that peasants could utilize for pasturing livestock and gathering firewood. The courts enforced these prerogatives, causing widespread discontent. This agricultural recession also reduced tax income for the government just when French involvement in the American Revolution was putting further pressure on finances. Various proposals to raise revenues and reduce debt through new taxes met stiff public resistance and led directly to the government's decision in 1788 to reconvene the Estates General in 1789 to address the nation's financial crisis.

As political excitement across France grew in 1788 and 1789, a series of highly unusual weather events occurred. Following crop damage caused by an abnormally dry spring, on July 13, 1788, a hailstorm destroyed hundreds of square miles of crops just before harvest time. These events were followed by one of the longest, coldest winters in French history, which caused widespread starvation in the countryside and a spike in grain prices in urban areas.

There is little question that food shortages and increased food prices further eroded support for the king and contributed to the unrest of the French Revolution. Government efforts to deal with the crisis in the winter of 1789 by limiting grain exports and increasing imports failed. Other European countries also were experiencing shortages, and frozen rivers and canals made transport difficult and expensive. In the summer of 1789, peasant discontent over high taxes and the nobility's recent efforts to extract more money from them by enforcing old rights and privileges contributed to the nationwide peasant revolts known as the Great Fear. This led directly to the revolution's August Days in which the National Assembly ended the feudal privileges of the clergy and nobility. The Women's March on Versailles, which occurred on October 4, 1789, involved 6,000 to 7,000 women (and some men) who broke into the Versailles palace and

demanded that Louis XVI do something about bread shortages and high prices. The crowd referred to Queen Marie Antoinette and the young Dauphin Louis Charles as “the baker’s wife” and “the baker’s boy.” In response, the royal family left Versailles and returned to Paris, accompanied by the crowd, who also brought wagonloads of flour from palace storerooms, creating the public perception that the court at Versailles hoarded grain while ordinary Parisians starved. Although there is no evidence that Marie Antoinette actually uttered the famous phrase “let them eat cake” in response to bread shortages in Paris, there was a widespread perception that the royal couple was indifferent to the suffering of their subjects.

■ Introduction: Environmental Consequences of Human Activities

In all but a few cases, what humans did to the environment between 1750 and 1914 were things they had been doing for hundreds and even thousands of years. Deforestation had been going on since the beginnings of agriculture; polluted rivers, foul air, overcrowding, and disease had been a part of urban living since cities first appeared in the fourth millennium BCE; and transforming landscapes, disease pools, and animal populations through transregional migration, trade, and travel had ancient precedents long before the voyages of Vasco da Gama and Christopher Columbus launched a new era of global interaction in the 1400s. Even the utilization of coal, the first fossil fuel to be widely used in the nineteenth and twentieth centuries, was not entirely new. The Chinese may have been

using coal to smelt copper as long ago as 1000 BCE, and references to coal mining in England, Scotland, and other European areas can be found in thirteenth-century writings. Despite such continuities, the central theme in the history of humankind's environmental impact between 1750 and 1914 is change, change that occurred at a faster rate and with more profound effects than in any previous 150-year period in history.

The driving forces behind these changes varied over time and from region to region. For the era as a whole, however, the most important single agent for change was the doubling of the world's population from an estimated 769 million in 1750 to 1.65 billion in 1900. Inevitably, this meant that more land was allocated to farming and grazing; new irrigation projects were

undertaken; forests increasingly were felled for fuel, timber, and conversion to arable land; the demand for minerals swelled; more animals were killed for their meat and furs; and more pollution was produced. The surge in numbers also created more city dwellers, who made up less than 3 percent of the world's population in 1800 and slightly over 10 percent in 1914. Such rapid urbanization, which also was driven by industrialization and various socioeconomic changes in rural areas, exacerbated age-old problems of ridding cities of garbage and human and animal wastes while simultaneously providing clean water for drinking and cooking.

A second source of worldwide environmental change between 1750 and 1914 was the increased interaction among the world's people. Explorers, missionaries, sailors, whalers, and sealers from Europe and the United States introduced killer diseases to the Pacific islands. Steamships, railroads, and the movements of soldiers and tourists made it possible for diseases like cholera and the plague to transform themselves from local outbreaks to worldwide pandemics. Imperialism hastened the exploitation of African and Asian minerals, forests, and arable land to meet the needs of the West's industrial economy. Mass migrations filled up virtually empty regions of the Americas and Australia and led to the creation of farms, ranches, towns, and cities on lands barely disturbed by any human presence. The introduction of European plants and animals—sheep, cattle, pigs, rabbits, and rats, among others—had already transformed the Americas' environment beginning in the sixteenth century and did the same in the nineteenth century to Australia, New Zealand, and many Pacific islands.

Industrialization was a third major cause of global environmental change, even though it was concentrated in only a few regions. Its most immediate effects were in cities. Early in the Industrial Revolution when water power was the main source of energy, most factories and mills were built in rural areas. This changed, however, after the 1820s, when most industries came to be concentrated in cities after coal not only replaced water power and wood as the major source of energy for industry but also became the fuel of choice for home heating and cooking.

City-based industrialization added to congestion and overcrowding, produced by-products, many of them extremely toxic, that further polluted the air and water supplies, and added to noise pollution through the constant din of factory whistles, steam engines, and construction sites. By far the greatest urban polluter was coal. In heavily industrialized England, coal production increased from 10 million tons in 1800 to 60 million tons in 1850 and 225 million tons in 1900. Wherever coal became the dominant urban fuel (and this includes cities as far-flung as Pittsburgh and Kolkata), its burning produced enormous amounts of ash; covered clothes, gardens, and furniture with soot; and filled the air with smoke that caused respiratory problems, eye diseases, and acid rain.

The environmental effects of industrialization were not, of course, limited to cities. World agriculture was affected, as millions of acres of land were given over to growing cotton or grazing sheep to meet demands of textile manufacturers. Mining for coal and a host of metals, including iron, copper, nickel, tin, and gold, expanded in many parts of the world, bringing with it a host of health and safety problems for miners and many adverse environmental effects, including air degradation, damage to local plants, animals, and soil quality, and pollution of waterways and aquifers through mine drainage. Smelting operations, in which ores often were roasted over coal or charcoal in open pits, were even more damaging. Even some of the benefits of industrialization had negative environmental effects. Industrialization put new wealth into the pockets of Europeans and Americans, whose consumer demands contributed to deforestation in tropical regions (so ever greater quantities of coffee, tea, and sugar could be grown); encouraged the hunt for whales (whose oil was used in lamps and whose bones were used for corsets, fishing rods, umbrellas, and whips), elephants (whose ivory was used for billiard balls and piano keys), rhinoceroses, hippopotami, tigers, and lions (whose stuffed heads could be viewed in trophy rooms); and resulted in the killing of millions of fur-bearing animals (whose pelts were turned into hats, coats, and gloves).

Human effects on the world's environment were not entirely negative. Forest preservation

programs were established in Europe, the United States, and British India. Organizations to protect wildlife came into existence on both sides of the Atlantic, and governments took the first steps toward protecting wilderness regions and setting quotas for hunters. Steps also were taken to prevent and lessen the effects of pollution but with mixed results. Some cities instituted smoke abatement programs, but the tall chimneys they mandated lessened pollution at ground level but did not prevent it from being carried by the winds to surrounding regions. Many cities also installed or updated their sewer systems after it became evident that polluted water was a major cause of disease. After London completed its sewer system in 1865, it had no more outbreaks of cholera, but since the city's wastes were not eliminated or treated but instead were simply transported into the Thames River beyond the city's eastern limits, fish and shellfish taken from the Thames estuary soon were unfit to eat. Some decades later the city of Chicago undertook a massive project that reversed the flow of the Chicago and Calumet rivers so that beginning in 1900 its sewage flowed into the Illinois River and ultimately into the Mississippi. Chicago had clean drinking water but faced decades of lawsuits from cities on the Mississippi, which now were the recipients of Chicago's waste, and nearby states and the province of Ontario, which claimed, justifiably, that the diversion of Chicago's rivers lowered the level of the Great Lakes. Clearly, there would be no quick or easy solutions to the environmental traumas caused by human beings and their actions.

—James H. Overfield

Changing Patterns of African Land Use

The value and use of African land took new shape in the period of European contact and with the advent of colonial rule. The customary view of land value shifted to the notion that wealth could be achieved by owning property rights to land that could be exploited. Traditional practices of subsistence farming, pastoralism, and communal land ownership gave way to cash crop agriculture, increased dependence on the export of natural resources and farmed

Kimberly diamond mine in South Africa, between 1890 and 1915. By 1890 South African diamond mines were controlled by De Beers Consolidated Mines under Cecil Rhodes. (Frank and Frances Carpenter Collection, Library of Congress)

crops, and land ownership conflicts. Changes in land use varied from region to region depending on a region's resources and the economic benefits of exploitation, but increasingly the sharply conflicting values, uses, and views on land ownership between Africans and Europeans affected the control and use of the land.

During the colonial era, Europeans sought ways to encourage economic growth to pay for their military and administrative costs as well as to benefit individual merchants and the colonial power's domestic economy. The exploitation of Africa's natural resources and the commercial use of land often provided the solution. Africa's many resources had been exploited by Africans prior to colonial conquest, but under colonial rule wealth was extracted from the land without being redistributed to the African population as had previously been the case.

Many African regions were rich in metal and mineral deposits, offering mining opportunities for global markets. African gold mining had attracted sustained commercial activity via maritime contact with European powers in the 1400s, but direct European exploitation by Europeans of Africa's mineral resources began only in the 1800s. Beginning in the 1850s with

► LAND USE AFTER THE BERLIN CONFERENCE

Landownership took on new meaning during the scramble for African territories initiated by the Berlin Conference in 1884–1885. At the conference, European powers settled on a system for taking possession of African lands. Although no Africans attended, the conference developed rules for the partition, which later helped the colonizers divide Africa and create boundaries. During the subsequent colonial era, the pattern of landownership and boundaries in Africa shifted from traditional communal boundaries to private ownership and arbitrary boundaries set by the colonial powers.

Inherited by later generations, these colonial boundaries became the boundaries of nation-states. They challenged both the land-use prac-

tices of the precolonial past and future possibilities, including the transnational movements of pastoralists. Colonial boundaries redirected the flow of trade and peoples. The boundaries were created by Europeans and for Europeans without much knowledge of the continent itself and with little regard to Africans' interests. Colonial powers lumped together diverse cultural groups, cut across cultural lines, and made states either too small to support themselves or too large to be effectively governed. The arbitrary land boundaries established by the Europeans have had lasting effects for African states and remain an impediment to viable economic independence for many regions.

—Melissa L. Levison

the discovery of the copper belt of southern central Africa, profitable mining sparked worldwide interest in African lands. When diamonds were discovered in Kimberley, South Africa, in the 1860s, a series of dramatic events triggered industrialization and capitalist development, restructuring the economic history of the region. This mineral revolution placed African lands, especially those areas where minerals had been discovered, as focal points for European powers hoping to capitalize on the continent's natural resources and profit from the worldwide demand for these minerals. After 1886, South African gold mining reached a new level with the introduction of large mechanized mining equipment, allowing gold to be extracted from greater depths. Recognizing the economic potential in Africa's natural resources, colonizers capitalized as quickly and economically as feasible, taking land from traditional practices such as subsistence farming and pastoralism. Despite early European interest, gold mining in West Africa remained in African hands until 1897, when the British-owned Ashanti Goldfields Corporation gained a concession in the Gold Coast. Equipment was diverted from South Africa during the Boer War, and mining techniques were quickly modernized. In the mineral-rich Central African Katanga region, a multinational group of investors began exploitation of the copper mines

after King Leopold claimed territorial possession in 1891.

Changes in agriculture also affected land use in Africa. In many regions, farming shifted away from domestic farming for subsistence to commercial cash crop production for profit. In West and Central African coastal regions, the use of lands adjacent to the slave castles shifted to crops such as maize that could provide food to European ships. As the slave trade gave way to legitimate commerce, more land was used to produce cash crops including groundnuts, coffee, tobacco, palm oil, cocoa, sugarcane, maize, and cotton, all destined for markets outside Africa. The new commercial commodities were a mix of indigenous crops and new crops introduced from the Atlantic world, such as maize and tobacco. During the nineteenth century, cash crop agriculture increased with the necessity of taking land from traditional farming practices, inevitably affecting food production. Forced labor sometimes was utilized on lands appropriated by European settlers, as in the case of cotton growing in German East Africa or timber in German Togo, but typically cash crop farming allowed Africans to meet the heavy taxation demands placed on them by colonizers.

Conflicts over land between agricultural and pastoral African groups existed prior to colonialism; however, with the increase in agricultural

cash crop production, spurred by European involvement, the struggle for land ownership between these groups intensified. For example, among the displaced Maasai groups in the Rift Valley of East Africa, limited land propelled groups to vie for tenure. Conflicts also occurred between German and British colonial administrations and native pastoralists when outside powers attempted to transform the traditional practice of pastoralism into commercial agriculture. Pastoral groups such as the Maasai traditionally used and traveled over large areas of land to provide for their animals; however, as the numbers of cash crop plantations and subsistence agricultural plots increased, the land available to pastoralists significantly declined. Most significantly affected were regions most heavily settled by Europeans such as the temperate East African highlands and the frontiers of Southern Africa.

European colonists' exploitation and commercialization of natural resources and land sparked land tenure conflicts. In precolonial Africa little sense of private property existed, and land was seen as a resource to be used, not owned. This approach to land use changed most dramatically during the colonial period when land came to be viewed by the legal system as a commodity, something to be owned, sold, inherited, and exploited. Precolonial customary law provided that rights to land were negotiable and seen as collective or kinship rights as opposed to individual rights. As European powers' desire for profit grew, land became highly valued, causing conflict and debate. Under colonialism, Africans' views of customary law were co-opted in the service of colonial rule in order to appropriate unclaimed territory or territory that had been negotiated through treaties with traditional African rulers, as happened in the early mining claims in South Africa. Land use came to be seen as land ownership, and rights of individuals to use the land became the justification for ownership to the specific plot of land. The ambiguities of customary law and the frequent manipulation of it during the colonial period have left lasting tension and conflict that remain territorial issues in areas such as the Congo today.

Deforestation as Global Phenomenon

Although humans had cleared forests for millennia, deforestation increased substantially between 1750 and 1914. Rough estimates suggest that the forest cover diminished worldwide from 6.215 billion hectares in 1700 to 5.678 billion hectares in 1920, a reduction of 8.6 percent. The main causes were population growth and land clearance for agriculture, but other factors, such as industrialization, colonization, and new means of transportation and communication, also contributed. In response, concern over deforestation grew, as evidenced by the emergence of conservation and environmental movements, romanticism, and the concept of rational forestry.

Industrialization increased demand for wood for fuel, construction timber, and other useful industrial products from trees such as bark and resin. Wood remained a key source for heating until far into the twentieth century, despite the growing use of coal. As a result, cutting was done more systematically. Previously, logging mainly involved the cutting of individual trees by small-scale owners, but increasingly large-scale logging and processing operations moved directly into forests themselves. As a result, older forms of common forest usage that have functioned against deforestation such as pasture, collecting bedding for animals, wood gathering, and other means of subsistence declined.

The growth of the world's population, from 679 million in 1700 to 1.65 billion in 1900, also put pressure on the forests. Forest clearing for agriculture took part first in the temperate zones of the Northern Hemisphere, with the extinction of much of the North American primary forest as a prime example. It is probable that over 46 million hectares had been felled in the United States by 1850, with the eastern parts of the country affected most. Subsequently, forest clearing followed human migration patterns to the northern Midwest and eventually by the end of the nineteenth century to the Pacific Northwest. Altogether, about 121.4 million hectares of forest were lost.

In the subtropics and tropics, forests were cleared for the expansion of indigenous agriculture as well as for forest products for export. The loss of the forest cover was highest in tropical Africa, with about 83 million hectares lost, followed by Latin America with 76 million hectares lost and South Asia with 42 million hectares lost. Many forested areas were converted into plantations by European colonizers for growing commodities such as sugar, coffee, tea, tobacco, and cotton for the world market in places such as the Caribbean, Brazil, India, and Southeast Asia. Beginning in the second half of the nineteenth century, steamships made it faster and cheaper to ship the commodities grown in these regions to European and U.S. markets, and railways facilitated the exploitation of timber in remote areas.

One of the first environmentalists to discuss deforestation was the American George Perkins Marsh (1801–1882) in his work *Man and Nature* (1864). His thoughts about the role of forests as protectors of the soil and regulators of the water table were the intellectual foundation for the conservation movement. Romanticism, with its emphasis on the aesthetic values of forests, presented another perspective on deforestation. Believing that forests had a transcendental value, romantics praised them as a spiritual tonic against the ills of urban life. The concept of preservation, claiming to save the forest for its own sake and not for human ends as conservationists postulated, grew out of this thought. Rational forestry, the scientific study of forests with the

goal of balancing preservation and economic use, evolved in the late eighteenth century, especially in Central Europe. Foresters developed the concept of sustained yield, according to which the amount of wood harvested should not exceed what could be replanted. This principle has become a cornerstone of forest management until today.

The conservation, preservation, and rational forestry movements did not stop deforestation in all parts of the world. While the rate of deforestation decreased in the late nineteenth century in the temperate zones, it has increased since 1850 in the subtropics and tropics, where it has led to soil erosion, torrents, and gullies as well as long-term effects such as decreased precipitation, desiccation, and climate change. Deforestation continued in the twentieth century and is a major concern in the early twenty-first century.

Chinese Agriculture—Land Issues and Population Growth

Although scholars have feverishly debated the relationship between population and land use in Chinese history, it is commonly agreed that the increase of agricultural land has not kept pace with population growth since the eighteenth

century. Although many questions remain concerning the magnitude of population growth, the dynamism of Chinese society, and the emergence of an “agricultural revolution,” the consensus is that in this period population increased dramatically, resulting in heightened competition over scarce resources such as land, water, and food.

Population growth was the dominant factor in Chinese society during the eighteenth century, the most prosperous era of the Qing dynasty (1644–1911). Most demographers agree that the population increased during this century from around 100 million to over 300 million. Statistics show that population growth continued until the early twentieth century. Though the population of the empire grew both in absolute numbers and in density, there was tremendous regional variation. Some scholars argue that population growth was slight in the most densely populated Jiangnan area (southeastern China) between 1680 and 1850 compared to that of the whole empire; at the same time, the Sichuan area (southwestern China) had almost the same growth rate as the empire as a whole due to heavy immigration.

The Qing government attempted to increase arable farmland to support the burgeoning population. With the territorial expansion of the Qing empire, especially in the far north and west, extensive land reclamation took place. Large-scale migration from fully populated areas to frontier areas began in the mid-eighteenth century. Concurrently, the Qing government waived taxes on newly cultivated fields; in many areas, cultivators were entitled to private ownership of the fields, which motivated people to reclaim more land from rivers, lakes, highlands, and frontiers. As a result, arable land acreage greatly increased.

Agricultural production was significantly improved too. There was no major breakthrough in agricultural technologies, but traditional technologies were practiced with more sophistication. High-yield New World crops, such as maize and sweet potatoes, were introduced and spread. They contributed to an increase in agricultural production and became a basic food for people in many regions. Their ability to grow

on dry and sloping lands also helped to convert large mountain areas to farmlands. After 1700, the cropping pattern in the Yangzi delta shifted from single cropping within a year to double cropping, which included early-ripening rice in the spring and wheat or beans in the winter. Through the new cropping pattern, a higher yield was achieved on the same amount of land.

Did these changes enable agriculture of this time period to meet the needs of the expanding population? There are controversies focusing on whether the output per capita (or the agricultural productivity) increased and hence improved living standards. Older scholarship argued that China underwent “agricultural involution.” Scholars holding this view believe that although the agricultural production increased in total, such increase was the result of intensive labor input on land with no change in technologies, leading to diminishing labor productivity or declining output per capita. Some research shows that the output per capita did decline from the late 1700s and early 1800s.

Revisionists have a more positive view. They argue that there was an agricultural revolution in the seventeenth and eighteenth centuries, including the introduction of new crops, the intensification of agricultural cultivation, the introduction of new cropping patterns, and the spread of commercialization. In addition, the population growth rate in this area was surprisingly far below the level of the empire as a whole. Therefore, Chinese society before the early nineteenth century, especially in the Jiangnan area (lower Yangzi delta), enjoyed similar living standards, agricultural production, and labor productivity to those of England. Revisionist scholarship provides new perspectives on Chinese agriculture in this time period, but final conclusions cannot be drawn concerning population and land use in China due to the absence of accurate data on population and agricultural output.

Population Growth and Environmental Degradation in China

Many historians of China have concluded that population growth led to severe environmental degradation on a nationwide scale, especially after the late eighteenth century. One indication of environmental degradation was the increasing frequency and severity of droughts and floods in the nineteenth century and onward. Although it is hard to know the precise effects of population growth on the environment, a clear link existed between an increasing human-land ratio and the overexploitation of natural resources.

Rapid population growth was an important feature of eighteenth-century China. Demographers estimate that China's population almost tripled from the beginning of the century to more than 300 hundred million by the century's end. Such growth intensified exploitation of natural resources as a result of increased demand for food, land, timber, and minerals. Emperors of the early and high Qing period (1640s–1820s) implemented grand schemes of land reclamation, and new crops and cultivation methods were introduced to improve production. Although these efforts kept the massive population fed, environmental damage resulted.

Large mountainous areas were deforested and converted to farmlands. New World crops such as maize and sweet potatoes spread quickly to different regions in the eighteenth century because of their high yields and adaptability to the dry and sloping mountain environment. The spread of new crops was a double-edged sword, providing food for the Chinese people but also contributing to deforestation. Activities by *pengmin* (shack people)—refugees driven

to the mountains by war, famine, tax burdens, and other causes—also depleted the highland resources. The *pengmin* chopped down trees, cultivated crops, and exploited mines, resulting in mountain soil erosion. Tons of soil carried from upstream highlands filled riverbeds, slowed water flow, and contributed to downstream floods. In addition, deforestation destroyed the habitats for animals (i.e., elephants and tigers) and led to the extinctions of animal species.

In the lowlands of southern and southeastern China, land was mainly reclaimed from marshes, lakes, and river floodplains, and the risk of flooding increased. Sophisticated schemes of irrigation and flood control had existed for centuries in these areas. Basic water control constructions included *yuan* (small circular constructions to protect farmlands from river waters) and long dikes. Farmlands were usually subject to taxation by the government. However, the Qing government exempted newly cultivated land from taxes in the mid-eighteenth century. Consequently, many people built illegal dikes to reclaim land from rivers and lakes in order to increase agricultural profits. Such behavior blocked the waterways and caused larger and more frequent floods in the eighteenth century.

The frontier environment was also deteriorating as a result of population growth and migration. From the mid-eighteenth century onward, the Qing government lessened the restrictions on migration from southern and eastern China to the northern and western frontier areas. Indeed, the government encouraged migration to these border regions by providing financial and material aid to migrants. The areas beyond the Great Wall were gradually opened up, and a significant portion of the northwestern prairies was converted to agricultural land. Intensive cultivation damaged the topsoil of land and speeded desertification.

Population dynamics and environment are certainly closely related. However, it is uncertain whether demographic change was the main reason for environmental degradation. Other socioeconomic factors such as the problem of resource distribution might also have influenced resource exploitation. For example, vague property ownership rules led to the overuse of common-pool resources by self-interested

individuals. Other scholars argue that the lower than average temperature and higher rainfalls of this time period also contributed to natural disasters. Therefore, the problem of environmental degradation can be best understood as the result of multiple causes.

Air Pollution and the Industrial Revolution in Europe

The Industrial Revolution depended on coal, iron, and steel. Coal combustion and chemicals released during the smelting of metal ores were two major sources for the escalating air pollution during this period. Yet paradoxically, large-scale industry did not cause most pollution in the early period of industrialization. Thousands of open hearths in individual households, often burning sulfurous bituminous coal with insufficient oxygen, sullied the air in Europe's teeming urban areas with particulates and sulfur dioxide. Domestic hearths produced 85 percent of all smoke in Great Britain in the early nineteenth century. Hundreds of thousands of fireplaces in London contributed to a gradual rise in the frequency of fog from about 1750 through the 1890s. A more apt term, "smog" (a word created by combining "smoke" with "fog"), was coined in 1905. A week of smog enveloped London in 1873, darkened the days, and led to more than 700 deaths.

In addition to pollution from domestic hearths, industrial emissions contaminated air in the vicinity of large industrial plants. The smelting of ores, for example, released quantities of sulfur that harmed vegetation, animals, and inhabitants. These problems were well known in the older industrialized regions. Freiburg in Saxony, for instance, boasted a long history of

mining and smelting, and public debates about links between local industry and air pollution took place from the late 1840s. Proposed solutions came from several quarters. Farmers and foresters from the forestry academy at Tharandt, in Germany, tried to determine which kinds of trees and other plants best resisted the impact of smoke and sulfur, while experts in hygiene and industrial technicians looked for ways to reduce emissions from the smelting plants. Their most important innovation was a chimney tall enough to disperse the emissions. The first such chimney, built in 1860, was 197 feet (60 meters) high; it was surpassed in 1889 by a chimney 460 feet (140 meters) high. Nonetheless, contemporary specialists knew that emissions did not disappear but instead were diluted in the atmosphere and fell to the ground within a larger radius. Polluting industries profited from dilution, for it complicated the evidence of any single industrial plant's responsibility for damage to property. Neighbors and farmers called for compensation, but the expense of lawsuits and the disputed effects of emissions made justice difficult. Tall chimney stacks became the norm throughout much of northern Europe from the 1860s, silencing local complaints and sending the problem elsewhere.

The decentralization of air pollution and the sheer variety of its sources also prevented control. In Great Britain, responsibility for regulating such hazards lay with local governments for most of the nineteenth century. Such a system of regulation faced notable drawbacks: local governments could not act against distant sources of pollution, they were the site of frequent conflicts of interest between officials and industry, and they embodied the basic belief that tough enforcement would drive away industrial employers. Lord Palmerston's Smoke Nuisance Abatement Act of 1853 pushed industry to implement the "best practical means" available to prevent smoke, and although prosecutions did occur while Palmerston remained home secretary, fines were rarely high enough to deter pollution. Besides, domestic pollution remained outside the orbit of the law.

Despite earlier national legislation, regulating air pollution on the European continent met with little more success. Napoleon Bonaparte

issued an imperial decree in 1810 to check industrial nuisances, and it continued to influence legislation not only in France but also in the Netherlands and postindependence Belgium. Aimed at industries that emitted “insalubrious” or “disagreeable” odors, the decree theoretically covered a variety of atmospheric pollutants but betrayed a distinct nineteenth-century preoccupation with odors (considered vectors of disease-causing miasma) and called explicitly for the protection only of local property owners. French citizens became increasingly vocal during the century, gradually placing industry on the defensive with respect to residents and public authorities.

Napoleon’s imperial decree did not provide for sanctions or penalties of any kind. Instead, it classified industries into categories according to allowable distances from human habitation, thereby foreshadowing the twentieth-century practice of industrial zoning. Under this system a multitude of sins was allowed to continue. Moreover, France lacked an adequate corps of industrial inspectors, even after passage of a more rigorous law on industrial nuisances in 1917. That function was given to an existing corps of labor inspectors, who were overburdened and generally lacked technical knowledge or authority when confronting big industrialists. The story was much the same in Belgium and the Netherlands. Following independence in 1830, the Belgians set up a system of preventive licenses but applied it casually. A Dutch nuisance act of 1875 placed considerable power to license industry in the hands of municipalities, but it too remained ineffectual.

Of the German states, Prussia possessed the most important industrial zones, including the Ruhr Basin, Silesia, and the region near Leipzig. In 1845 the Prussian government put into force a trade regulation (*Gewerbeordnung*), a law carried over by the German Reich in 1871. The regulation stipulated that every businessman who wanted to establish a factory that might harm the local environment had to request permission from the state authorities and publicize his intentions. Citizens could consult the plans and make objections, and authorities were obliged to take these objections into account. They could refuse

permission or place specific obligations upon the entrepreneur; their decisions could not, however, be questioned through judicial review.

As in France, the Prussian regulation functioned less to protect citizens against pollution than to ensure industry’s legal security and to protect private property. If a neighbor could prove that an industrial plant had damaged his property, he might obtain compensation from the polluting firm. Most complainants were farmers owning fields in the vicinity of industry and suffering from crop damage or fishers who lost their livelihood due to polluted rivers. Such cases were more often lost than won, however, and some courts imposed sanctions only on companies that “consciously” polluted their environments. Moreover, it was extremely difficult to establish precise links between specific plants and specific damages. At any rate, once a plant was approved, no avenues were available to close it down or to tighten the entrepreneur’s obligations. Only in the mid-twentieth century was the law rescinded.

Throughout Europe, few authorities wished to oppose industry in the nineteenth century. Even though technicians accumulated knowledge of filters, recycling of vapors, and much else—the expression “acid rain” was first used in 1872—they rarely acted to intervene at the source. In Germany, for example, “trade taxes” on industry flowed directly into municipal budgets, so most local authorities went no further than enforcing zoning policies. About a century after the Napoleonic decree inaugurated the practice in France, local planning authorities in Germany began to delimit urban zones that were to be shielded from industry. Whereas middle- and upper-class Germans typically inhabited the protected areas, industrial workers lived in industrialized zones and had to tolerate pollution. Reinforcing the class bias of zoning practices, a significant legal principle called *Ortsüblichkeit* (local custom) guided the German judiciary in matters of pollution. Lawyers and judges argued that inhabitants had to accept even major pollution when they lived in an area dominated by industry. The notion of local custom cast pollution as a part of local geography.

Human Impact on the Water Cycle

The water cycle is also known as the hydraulic cycle, referring to the unending circulation of water, driven by solar energy, between the atmosphere, terrestrial surface and underground waters, and the oceans. Water can change its state among liquid, ice, and vapor in this cycle. Human activity is an integral part of this cycle. Through direct manipulation of water bodies, humans have changed the natural pattern of the water cycle and adapted it to multiple purposes. From the eighteenth century to the early twentieth century rapid industrialization and urbanization significantly affected the distribution and quality of water. During this period, the scale and scope of environmental problems such as the severity and frequency of floods grew and new problems such as water pollution and epidemics caused by waterborne microorganisms increased.

Although humans had influenced the water cycle throughout history, limits of muscle power and technology prevented the intensive exploitation of water resources. This changed as a result of the Industrial Revolution, when people gradually disrupted the human-water balance. Basically, human activity affected the water cycle in two areas: the overabundance or scarcity of water in various places on the planet and the quality of water.

Farming was the major impetus for change chiefly through deforestation, which affected the movement of water in the terrestrial sphere. Rapid population growth, increasing demands for natural resources, and the drive for profit led to large-scale land reclamation schemes in both

Europe and Asia. Land reclamation increased the amount of cultivable land but it led to the felling of trees and the draining of wetlands. Deforestation, intensive agricultural cultivation, and wetland loss eroded the soil surface and decreased the infiltration of water in the terrestrial realm. At the same time, wells used as sources for both irrigation and drinking water lessened the groundwater flow in some areas, although the utilization of groundwater was less intensive than in the twentieth century.

Dam and dike construction and river diversion also affected the water cycle. Use of such technology in agricultural irrigation and flood control had a long history, notably in ancient Egypt, China, Sri Lanka, and Mesopotamia. After 1850 as a result of advances in science and

➤ 1887 YELLOW RIVER FLOOD

The Yellow (Huang He) River has been “China’s sorrow” throughout thousands of years of Chinese history and has flooded many times. Running through the loess plateau between Shaanxi and Shanxi provinces, the Yellow River carries a huge amount of silt, which has contributed to a notoriously high-level riverbed. The erratic flows of river waters and changeable river course also have brought unpredictable troubles to the river basin area. For centuries Chinese people had built dikes to tame the river, but such intervention into the natural cycle of the river in some cases accentuated the flooding problem.

The Yellow River flood in 1887 was one of the worst floods in recorded history. In the fall of that year, rising river waters accompanied by heavy rainfalls breached the dike section in Henan Province, which led to a massive flood in the flat northern China plain. Approximately 11 cities and 300 villages, covering approximately 50,000 square miles (129,500 square kilometers), were inundated in waters that were 20–30 feet (6–9 meters) deep. It is estimated that as many as 900,000 people died in the flood and 2 million people became homeless. In the aftermath of the flood, a pandemic and lack of basic necessities caused additional deaths. The Yellow River flood is believed to be the most devastating flood in history.

—Yan Gao

technology, dam and dike construction also increased. Many large dams were built in Europe and the United States mainly for irrigation and by the turn of the century for electricity as well (the hydroelectric power station at Niagara Falls in the 1890s is a famous example of this). In China the grand scheme of taming the Yellow River had been carried out for centuries by building long, firm dikes. Numerous dams and dikes served as barriers for water flows and slowed down surface water runoff, which increased the risk of floods. In addition, dams and dikes contributed to the siltation of a number of rivers, which brought bigger and more frequent floods. The increasing frequency of floods in nineteenth-century China was an example of the disrupted water cycle.

Urbanization, which required water for recreational and municipal purposes, seriously challenged the water cycle. Urbanization meant erecting buildings, paving roads, and constructing systems to provide water for urban residents. These activities produced hard, impervious surfaces and decreased the ability of the land to absorb water. This in turn increased flood risks by increasing the amount of surface runoff of water. The diminishing infiltration of surface runoff could lead to the decline of groundwater levels, affecting stream flows during dry weather and even contributing to the process of desertification.

The quality of water was also affected by the process of industrialization and urbanization during this time period. Before 1800 water pollution was a local matter, but in the nineteenth century human impact on water bodies became more and more widespread, especially in industrial areas. For example, while in 1848 only modest water contamination in Lake Michigan was caused by waste from the 30,000 Chicago residents, in 1885–1886 alone 90,000 people around Chicago died of waterborne diseases, mainly typhoid. Although intense human activity scarcely extended beyond the inland seas and coastal areas even in the twentieth century, coastal water bodies were still adversely affected by different types of pollution. Heavy metals from industries usually found their way into lakes, rivers, and finally seas, a process that had destructive effects on the marine environment.

The Columbian Exchange

In 1750, the process referred to by some scholars as the Columbian Exchange had been under way for at least one quarter of a millennium. Named after Christopher Columbus, this exchange involved the transfer of plants, animals, and other organisms between the Old World and the New World. Organisms such as horses and cacao, distributed along the commodity networks of the Atlantic, had already begun to transform societies on both sides of that ocean, while others such as smallpox and influenza had annihilated aboriginal societies in the Americas, Oceania, and Australasia, allowing for increased settlement by Europeans and others. In the latter part of the eighteenth century, these patterns continued to develop as economic regimes grew in scale and capacity, as human migrations increased in size and complexity, and as the power of the nation-state increased. By the early twentieth century, everyday life around the world had been transformed.

The local on-the-ground effects of these exchanges were extremely complex. Often, the same commodity could play very different roles in different settings. Almost immediately after their introduction to Asia, for example, American plants such as sweet potatoes and tobacco began to be incorporated into Chinese society, in fact helping spur an agricultural revolution, but these staples had little impact in India until the nineteenth century.

Such exchanges often had enormous ecological ramifications: innocuous plants in their original settings became invasive weeds in new ones, while introduced animals competed with or preyed upon indigenous ones. In most cases, organisms accompanying new settler

THE TORTUOUS HISTORY OF A TUBER

Few things illustrate the complexity of the Columbian Exchange more than the history of *Solanum tuberosum*, the potato. Originally a bitter, altitude-loving wild tuber, it had been domesticated at least 2,000 years ago by indigenous peoples living in what is now Peru and Bolivia, resulting in cultivars of diverse colors, shapes, tastes, growth habits, and ecological niches. Encountered by the Spanish in 1537, potatoes were one of the earliest commodities of the Columbian Exchange, although it would take at least two centuries for the potato to overcome European growing conditions and become a staple food. Thanks to its subterranean productivity, the potato also had to overcome widespread beliefs in its questionable impact on morals. Many Europeans, from religious and intellectual elites to peasants and the urban poor, thought that the potato caused disease, moral degeneration, and even promiscuity. While often associated with the poor in Europe, the potato could also be a food of the elite. In 1793, for

example, they were being grown in the royal Tuileries of Paris. European migrants then brought potatoes with them to their colonies including those in the Americas, the tuber's second Atlantic crossing. The ecology of the potato, when combined with the economic and political policies of nation-states, could cause new migrations in its own right. The best-known example is that of the potato blight that devastated Ireland in the nineteenth century, leading to a new diaspora of the Irish out of Europe and into settler societies in such places as Canada and the United States. As peoples and places became increasingly interconnected through empire and globalization, the potato would be there to the extent that it is now a staple in cuisines and economies around the world, ranging from Indian *aloo tikka*, Italian *gnocchi*, Ashkenazi-Jewish *latkes*, McDonald's ubiquitous fries, and, back on the plant's home turf, *patapas a la huancaína*.

—Coll Thrush

populations triumphed in these new environments. Examples include Norway rats on Caribbean and Pacific islands, rabbits in Australia, and bilgewater-borne mosquitoes in Hawaii. Sometimes, as was particularly true with diseases, the effects of these migrations were felt far ahead of the settler newcomers. In the case of the horse, its introduction by the Spanish into the Great Plains of North America made aboriginal bison-hunting practices more efficient and, arguably, more destructive prior to the near extinction of the great bison herds at the hands and guns of Americans.

For all their complexities and ironies, however, these exchanges, when considered together, generally favored the colonizer over the colonized, the introduced over the indigenous, and—by the twentieth century—utilitarian simplicity (e.g., monocropping) over cultural and biological diversity. In Africa, for example, maize had been incorporated into many local food systems soon after its introduction in the sixteenth century as part of a diverse suite of food-production practices. Only in the nineteenth

century, as those food systems were drawn into global markets that demanded regularity from their commodities, would dependency on maize as a staple contribute to food insecurity there. Informed by closely linked colonial discourses and doctrines of cultivation, labor, and improvement—all of which had profound racial and religious origins and implications—that developed in the late eighteenth and early nineteenth centuries, the exchange of people and things between ecologies and continents was far from an equitable process. Combined with the rise of both the nation-state and economies of scale associated with nineteenth-century industrial capitalism, such ecological transformations generally favored certain classes of people. For example, attempts by governmental entities to ameliorate the negative environmental effects that often accompanied colonialism—soil erosion caused by introduced livestock, the destruction of fisheries by industrial and agricultural pollution, and so on—all too often served corporate interests while simultaneously marginalizing or even criminalizing the

powerless, most notably aboriginal communities, immigrant groups, and those living at subsistence levels more generally. Such practices, which some scholars now refer to as environmental injustice, were important elements of life in settler societies such as the United States and South Africa, where ecological exchange had resulted in stark inequalities of both opportunity and condition.

In the end, then, the question remains as to what to call this larger process. The term “Columbian Exchange” is perhaps a bit of a misnomer in that it takes its name from Christopher Columbus and thus erroneously focuses on Europeans as the sole or primary actors, while the term “exchange” suggests a relatively equal and neutral mutuality. Another term that has been suggested, then, is “ecological imperialism,” which has found support from many scholars thanks to its acknowledgment that biological and ecological processes facilitated new social and economic relations and that these relations were far from equal. Perhaps the most powerful indicator of the effects of these patterns is the extent to which they had come to seem normal by the early twentieth century: the Great Plains as the breadbasket of North America, so-called authentic dishes such as Italian marinara or West African *piri piri* or Irish potato stew, nonaboriginal majorities in places such as Argentina and New Zealand—and the simple fact that many people in these places continue to think that “that’s the way it’s always been”—all attest to the profound effects of the Columbian Exchange.

Extinctions and Near-Extinctions

Although extinction is a natural phenomenon and a fate that has befallen an estimated 99.9 percent of all species that have ever lived on this planet, between 1750 and 1914 the many changes wrought by the Industrial Revolution and human population growth led to the destruction of a number of plant and animal species. This period also marked the emergence of a scientific and popular understanding of extinction as both a natural occurrence and the result of human actions.

The extinction of a species may be triggered by a number of causes, either internal (genetic) or external (environmental). A lack of genetic diversity, genetic degradation through hybridization, habitat loss, overpredation, disease, and climate change can, either independently or, as is more often the case, in tandem with other factors, lead to the annihilation of a species. All of these factors may occur naturally or as the result of human activity, whether intentional or inadvertent.

The Industrial Revolution in Britain and, later, continental Europe and the United States negatively affected plant and animal species in several ways. At the most basic level, an increase in the human population meant a corresponding increase in the need for food and space, which in some cases led to overhunting and the wholesale destruction of habitats to make way for farms and cities. The Industrial Revolution also prompted the diffusion of people to areas of the globe that had previously seen little, if any, human habitation. Species on remote islands, for instance, had evolved in isolation and so could not withstand even minor changes in their habitats. Similarly, animals living in frontier areas had little fear of human newcomers and made easy prey for food or sport. The factory system created by the Industrial Revolution allowed for production on a much greater scale, leading many fur- or feather-bearing animals to be hunted to or over the brink of extinction. New forms of transportation, machinery, and weapons facilitated the rapid destruction of even once widespread and abundant species.

These trends are evident when one examines even a small sampling of the numerous

► THE NEAR-EXTINCTION OF THE AMERICAN BUFFALO

The now famous near-extinction of the American buffalo (*Bison bison*) during the 1800s was prompted by both economic and cultural pressures. Large-scale cattle ranchers disliked buffalo because they competed with domestic cattle for grazing land. Buffalo were also considered a nuisance by railroad companies because large herds could damage tracks and locomotives and cause lengthy delays. Most importantly, however, buffalo were seen as the key to breaking Indian resistance on the Great Plains. By destroying the large herds that were both the main food source and symbolic center of many tribes, Anglo-Americans hoped to starve, or at least force the relocation of, Native American groups hostile to white expansion.

Actively encouraged by the federal government and military, buffalo hunting increased dramatically beginning in the mid-1800s. Several hundred commercial hunting operations killed tens of thousands of buffalo each day. Hides were shipped back east and to European markets and were made into clothing, rugs, and even machine

belts. Additionally, individuals traveling via railroad often shot buffalo from their train cars for sport. Such wholesale slaughter soon took its toll. While there had been an estimated 60 million buffalo at the beginning of the 1800s, by 1875 that number had dwindled to about 1 million. Just 20 years later, in 1895, there were only a few hundred buffalo left.

By the 1870s, it had become apparent to the general public that the buffalo was facing extinction. In 1876, zoologist Joel A. Allen published a series of articles highlighting the precipitous decline of the species and arguing for protection of the remaining herds. Initial efforts at preservation, however, were hampered both by the powerful railroad and ranching industries and the buffalo's integral role in the war of attrition against the Plains Indians. It was only through the development of privately owned herds in the late 1800s and early 1900s, such as that of rancher James Philip, that the buffalo was saved from extinction.

—Maxine Taylor

species that met their ends during the late eighteenth, nineteenth, and early twentieth centuries. Many were overhunted, including the sea mink, a North American mammal that died out in the 1860s as a result of large-scale fur trapping. Similarly, *Santalum fernandezianum*, a plant native to Chile, was harvested to the point of extinction in the early 1900s for its aromatic wood that was used to fashion a variety of decorative household objects. Other species, such as Bennett's seaweed, were destroyed more indirectly from human contact. A red algae found in the coastal waters of Australia, Bennett's seaweed became extinct by the early 1900s due to water pollution and an increased level of silt that were the results of the high volume of maritime traffic to Australia.

In other cases, species disappeared through a combination of anthropogenic (human caused) factors. Steller's sea cow, for instance, was a large marine mammal native to the Bering Sea that was driven to extinction in the 1760s predominantly as a result of overhunting for its meat, oil, and hide. Overhunting of sea otters in the same

region also had a role to play in the sea cow's demise: in the absence of the sea otter, the sea urchin's natural predator, sea urchins proliferated, in turn competing with the sea cow for the sea grasses that made up the diets of both species. The tarpan, a breed of small Eurasian horse, slowly disappeared as a unique species through hunting and hybridization with domesticated horse varieties, finally meeting its end in the early 1900s. The quagga, a relative of the zebra that once roamed southern Africa, was hunted for its meat and hide, but was also decimated through competition for grazing land with domestic sheep and goats brought by settlers.

Even species that were once abundant could fall victim to human excess. The passenger pigeon was once one of the most prolific avian species in North America, with an estimated population of between 3 and 5 billion birds. During the 1800s, however, vast numbers—sometimes as many as 50,000 a day in one location—were killed in order to provide inexpensive meat to city dwellers, supplied regularly by railroad. And, because passenger pigeons

could only survive predation through large flock size, once numbers dropped past a threshold that may have seemed still quite high, the animals could not effectively employ this survival strategy. The last passenger pigeons were killed in the early 1900s, although extinction may have been inevitable for decades.

Perhaps more significant than the loss of these and other species during this time was the burgeoning scientific awareness of extinction, first as a natural reality and, by the late 1800s, as a phenomenon that could be produced—or prevented—by humans. Until the late 1700s, the extinction of a species was inconceivable. The concept of extinction was incompatible with the *scala naturae* (“Great Chain of Being”), the predominant framework for understanding the natural world that had been in place since antiquity. According to the Great Chain of Being, all of nature was ordered from least perfect (soil) to most perfect (God). Extinction was impossible because there could be no missing “links” in the chain, which was seen as unchanging and without flaws. The concept of the “Balance of Nature”—that God had created an adequate number of creatures and would not allow any of them to disappear because this would create disharmony in nature—was also a central belief.

Fossils were widely held to be the remains of species still in existence elsewhere on the planet. (And, because much of the globe remained uncharted, it was difficult to dismiss this theory.) Others suggested that fossils were the victims of the biblical Flood, thus helping make the idea of extinction more acceptable by placing it within a religious context. Yet it was not until the French paleontologist and anatomist Georges Cuvier (1769–1832) delivered a paper in 1796 on the distinctions between fossilized mastodons and extant elephant species that extinction became accepted as scientific fact. Cuvier, who became the chief proponent of catastrophism, believed that many species had become extinct in the past due to natural “revolutions” or dramatic earth-changing events.

The acceptance within the scientific community of extinction as a natural phenomenon led most naturalists to regard contemporary examples of apparent extinction with a sense of resignation. The belief that humans could not—and

should not—influence the fate of a species was supported in the mid-1800s by Charles Darwin’s theories of natural selection and survival of the fittest. If a species declined, it was argued, it was because it was inherently less viable than others, and its extinction was a natural consequence of this inferiority. In the late 1800s, however, amid increasingly unarguable examples of human-induced extinction, it became clear that humans had had a direct role in the annihilation of a number of species.

These scientific advances were accompanied by an increased popular interest in natural history. By the early 1800s, “bioprospecting”—the exploration of new regions in order to bring back plant and animal specimens for elaborate gardens and menageries—had become a favorite hobby among the upper class. As interest increased, the number of zoos and museums skyrocketed. Although the stocking of these personal and public collections often helped spur extinctions, the interest in natural history also heightened awareness of endangered species. In the mid-1800s, for example, Europeans and Americans became fascinated with the dodo, a flightless bird native to Mauritius that had been extinct since the late 1600s. Although little interest had been paid to the dodo until this time and many people believed the strange-looking creature had been a myth, the discovery of a number of dodo bones captivated the public’s imagination and brought the man-made extinction of the dodo and other species to light. The dodo has remained perhaps the most recognizable and culturally significant symbol of extinction.

With dawning awareness of man’s impact on the fate of species, by the late 1800s calls for conservation increased, spurring the passage of regulatory and protective legislation and the creation of wildlife preserves and captive breeding programs. This heightened interest coincided with a number of other social trends, including Progressivism (the social reform movements of the era that rejected “laissez faire” policies). In addition to viewing the extinction of a species as an economic and ecological loss, the public began to see it as a moral one, a symbolic failure of forward-thinking modernism. The preservation of endangered species also went hand-in-hand with imperialism, as naturalists in Europe and

the United States turned increasing attention to species in Africa, Oceania, and Latin America.

The Rise and Fall of the Worldwide Whaling Industry

Commercial whaling originated in the coastal regions of western Europe in the eighth or ninth century. After 1750, the industry expanded rapidly to different parts of the northern and southern Atlantic, driven by technological change and a growing demand for whale oil, used mostly for lighting. During the eighteenth and nineteenth centuries, the industry remained essentially unregulated. Competition between the main whaling nations was intense and fueled a constant search for new whaling grounds and more efficient hunting and processing methods. By 1900, key whale products had been replaced by other materials, and whale stocks in many regions of the globe were depleted, resulting in the gradual decline of the industry.

Archeological evidence suggests that whale harvests took place as early as the first century CE in the Bering Strait. The Basques, however, were the first commercial whalers, using small boats and implements with iron blades to kill slow-swimming right whales in the Bay of Biscay for an emerging international market around 1000 CE. Sometime before 1500, the Basques constructed larger boats and crossed the Atlantic Ocean to hunt off the coasts of Newfoundland and Labrador. They were met on the Grand Banks by ships from Britain and France in the early sixteenth century, and the region

Whaling ships and casks of whale oil in New Bedford, Massachusetts, 1901. (National Oceanic and Atmospheric Association)

subsequently became the center of the European whale trade. Led by Holland, the several whaling nations expanded their operations to the waters near Spitsbergen in the Arctic Ocean amid growing competition and rising oil prices in the mid-seventeenth century. By 1815, England was the dominant global whaling power, due in large part to its control of the hunting grounds for right and bowhead whales in the Davis Strait, west of Greenland.

When North Americans began whaling in the eighteenth century, they were primarily interested in sperm whales. These large whales yielded less oil than other whales but contained ambergris and spermaceti, which were valuable for their use in the production of perfume and candles. The New England whale fishery reached its apex in the 1720s, when Nantucket and New Bedford emerged as important production centers and ports for the larger whaling vessels of the era. Subsequently, American whalers sought out new whaling grounds near the Falkland Islands and in the Pacific Ocean, where they discovered rich stocks of bowhead and gray whales off the coasts of Alaska and Baja California in the mid-1800s. Meanwhile, English whalers moved into the southern Atlantic Ocean and the Indian Ocean in search of sperm whales and into the bays of Tasmania, Australia, and New Zealand in pursuit of right whales.

In 1863, the invention of the harpoon cannon by Norwegian Svend Foyn launched the era

of modern industrial whaling. When mounted on steam-powered ships, this invention enabled the traditional whaling powers, as well as new whaling nations such as Japan and Russia, to kill large numbers of fast-swimming whales in previously unexploited waters, first near northern Norway and later in the Antarctic. As a result, several whale species were nearly exterminated by the turn of the twentieth century. In 1904 and 1913, this intensive exploitation led to bans on coastal whaling in Norway and Iceland. In the 1930s, the leading whaling nations signed the first international treaties regulating pelagic, or open-sea, whaling, which was increasingly conducted after 1926 with large factory ships capable of processing entire whales on board. This growing concern about diminishing whale stocks, in combination with the earlier development of alternatives to whale oil as the process for refining kerosene improved, signaled the start of a gradual decline in worldwide whaling.

Polluted Waterways—The Thames River and London’s Big Stink of 1858

The Big Stink of London occurred during the summer of 1858, when exceptionally hot weather and unprecedented levels of pollution overwhelmed the Thames River. As an immediate result, the unbearable stench fuming from the river caused members of Parliament to evacuate the chambers of the House of Commons. More importantly, the events surrounding the summer of 1858 became a catalyst for massive projects of sewage reform in London and throughout Britain.

The polluted state of the Thames River in 1858 was a result of several factors. Intense

and rapid industrialization and urbanization in Europe during the eighteenth and nineteenth centuries increased population densities and environmental pollution, perhaps most acutely in London. In 1800 London’s population had reached more than 1 million, and by 1850 the capital had more than 2.5 million inhabitants. Coupled with unsanitary living conditions, insufficient hygiene, overwhelming poverty, and the tidal flow of the Thames, waterborne epidemics led to staggering mortality rates. Once contaminated, pumped and piped water is a highly efficient medium for the transmission of epidemic disease. Indeed, as population densities rose, waterborne epidemics were the primary hazard to urban populations. Cholera, typhoid fever, dysentery, and various other conditions of diarrhea all contributed to the high mortality rates witnessed by nineteenth-century populations.

The dominance of the miasmatic theory (that bad air causes diseases) and anticontagionism (that diseases were not caused by specific agents) among laypersons and physicians deflected attention from direct person-to-person spread of disease and further hindered effective responses until the full development of germ theory. The medical understanding of the specificity of disease and the role of water in spreading epidemics began to change first with epidemiological studies conducted by the London physician John Snow during the cholera outbreaks of 1848–1849 and 1854–1855. Subsequent epidemiological and bacteriological investigations under John Simon’s staff at the Privy Council and the Local Government Board (John Netten Radcliffe, George Buchanan, John Burden Sanderson, and Richard Thorne-Thorne) provided the conclusive evidence of the waterborne transmission of these deadly epidemic diseases.

Concurrent improvements in water supply throughout the first half of the nineteenth century only exacerbated the threat of waterborne epidemics. The sewers that did exist were poorly constructed and were most often unconnected. The majority of the London water supply was inadequately provided by pipes originally laid by the Romans and distributed through local parish pumps. Although plans for a comprehensive sewer system had been discussed

LONDON METROPOLITAN SEWERS, 1858

METROPOLITAN SEWER SYSTEM, CIRCA 1858

The construction of the sewers by the Metropolitan Board of Works after 1858 was the defining civil engineering project of the nineteenth century. Between 1856 and 1859 alone more than 82 miles (132 kilometers) of brick intercepting sewers were built in London. The intercepting sewers were connected to more than 450 miles (724 kilometers) of main sewers, which received the contents of 13,000 miles (20,921 kilometers) of small local

sewers. In all, the new metropolitan sewers serviced about half a million gallons (nearly two million liters) of waste per day. The construction of the intercepting sewer system involved more than 300 million bricks, about 900,000 cubic yards (688,100 cubic meters) of concrete and mortar, and the excavation of more than 3.5 million cubic yards (2.7 million cubic meters) of earth.

—Jacob Steere-Williams

by the Royal Commission of the Corporation of the City of London and Parliament created the Metropolitan Board of Works in 1851, it was not until the summer of 1858 that legislative action would be taken to remedy the polluted state of London's waterways.

As a result of the fetid status of the Thames in 1858, Parliament witnessed firsthand the state of the Thames and took decisive action. New legislation greatly expanded the authority of the Metropolitan Board of Works, then under the control of public health engineer Joseph Bazalgette. Parliament granted Bazalgette the power to construct a completely new system of drainage for the entire metropolitan area. Bazalgette's

scheme included new pumping stations, rebuilt sanitary sewers, and an intricate system of outfall works. The linchpin of Bazalgette's comprehensive plan was that Parliament gave the Metropolitan Board of Works taxing authority and loaned it 3 million pounds to complete the renovations.

Bazalgette's project continued throughout the second half of the nineteenth century. The whole system comprised more than 1,300 miles (2,092 kilometers) of sewers and four pumping stations. Deptford and Crossness were completed in 1865, Abbey Mills in 1868, and Western in 1875. Along with the main drainage scheme, Bazalgette's plans also included the embanking

of the Thames in central London, a major public health engineering feat. Indeed, the Big Stink of 1858 was a catalyst for many of the drainage reforms that improved London's waterways during the second half of the nineteenth century.

The Opening of the Great Plains in the Americas

The Great Plains region of North America, also known as the Prairies, comprises approximately 1.4 million square miles (3.6 million square kilometers) of the temperate continental interior. It extends approximately 2,400 miles (3,840 kilometers) from central Canada south through the United States into Mexico and is approximately 500 miles (800 kilometers) wide between the western boundary, the foothills of the Rocky Mountains, and the eastern boundary where its predominant but varied grassland merges with forest. Prior to European immigration, the region was occupied by numerous tribes of Native

Americans whose lifeways were dominated by hunting bison, the native herbivores, that roamed the plains in vast herds.

The Spanish conquistadors Francisco Vázquez de Coronado and Hernando de Soto were probably the first Europeans to arrive in the region, which they did independently in the southern United States in the early 1540s. They were searching for gold but found only scattered Native American settlements. Within the next 100 years Europeans were attracted to the region to exploit native animals, especially beaver, for fur. In 1803 the Louisiana Purchase gave the United States control over approximately 800,000 square miles (2.1 million square kilometers) of the French-owned territory of Louisiane, which extended into central Canada and comprised much of what is now the central portion of the United States, including the Great Plains. This purchase, along with Lewis and Clark's transcontinental expedition in 1804, made the interior more accessible and attractive to settlers who traveled west via waterways and wagon routes. Fur traders and fur companies continued the exploration of North America; their trading posts became the first significant European settlements in the Great Plains and beyond in the early 1800s.

The railway era in North America began in 1828. The iron horse spread rapidly along the eastern seaboard initially and then westward. Towns were established at railway heads, many of which became major cities such as Dodge City in Kansas and Fargo in North Dakota. Others

ENVIRONMENTAL CHANGE IN THE GREAT PLAINS

Environmental change caused by the settlement of the Great Plains was unprecedented. Flora, fauna, and soils were altered. As cropland replaced grassland, vast quantities of carbon dioxide were released into the atmosphere as roots, stems, and leaves were removed, often by fire, and the soil's organic carbon was subject to degradation. How many plant species became extinct remains unknown, but the plight of the passenger pigeon (*Ectopistes migratorius*) is well documented. Once an abundant game bird, its population was between 3 billion and 5 billion prior to 1700; by 1914

it was extinct. Loss of habitat, overhunting, expanding city markets for feathers (for hats) and meat, and the railway, which facilitated meat transport (especially following refrigeration in the 1850s), contributed to the pigeon's fate. The bison almost suffered the same fate for similar reasons, though it was especially targeted as part of the U.S. Army's program against Native Americans. Within a century only 1,000 animals remained from a population estimated to have been between 25 million and 60 million in 1800.

—*A. M. Mannion*

were ephemeral and disappeared as the railway moved on. These gateway settlements were the starting points for pioneers who continued farther west. By 1860 the railways were encroaching into the Great Plains; by the 1880s there were four transcontinental rail links whose construction was facilitated by generous land grants from the government. Land grants were also available to individuals through the Homestead Act of 1862, which awarded a claim of 160 acres (65 hectares) provided that the land was cultivated.

The period between 1860 and 1920 was one of tremendous environmental and social change as millions of settlers, mostly from Europe, transformed the social and economic landscapes, brought urbanization to this vast semiarid grassland region, made the passenger pigeon extinct, and almost drove the bison to extinction. It was not, however, a period of opportunity for Native Americans, who were mostly confined to reservations by 1880. By 1900 more than 200 million acres (81 million hectares) had been cleared as the frontier moved west and agriculture was established. Vast fields of cereal crops, especially wheat and corn, replaced grassland to create a cereal belt; oats, rye, and barley were also cultivated. The vast scale and rapid rate of change are reflected in the fact that between 1866 and 1900 the cultivation of wheat in the United States increased from 15.4 million acres (6.2 million hectares) to 49 million acres (19.8 million hectares) while the cultivation of corn increased from 30 million acres (12.1 million hectares) to 95 million acres (38.4 million hectares). Most of this expansion was in the Great Plains. Moreover, farmers became increasingly specialized so that crop monoculture became the predominant land use. By 1914 the Great Plains region had become a foundation of agricultural production in the United States.

Farther south, large-scale ranching started in Texas in the 1830s and moved north. This was due to a combination of factors, including an abundance of grass, native wild horses and cattle, good breeding programs that produced tough stock, a pioneering spirit, hard-working skilled adventurers (cowboys), the availability of range rights, westward-pushing railways, and an increasing market for meat in the eastern cities. Cattle were entirely range-reared until the

fatefully cold winter of 1886, after which ranchers began to produce feed as stock for harsh winters.

The Emergence of the Ranch in the American West

Ranches, generally speaking, are farms that rely on uncultivated, self-replenishing vegetation as fodder for livestock. Ranching is a way to utilize rangelands, too boggy, dry, hilly, or rocky for farming crops or too remote and inaccessible to attract settlers. Where grass will grow, cattle can graze and support an economy. The romanticized ranches of popular media reflect ranching practices followed shortly after the U.S. Civil War, but the roots of the nineteenth-century ranches go back centuries.

Cattle were domesticated more than 6,000 years ago in Anatolia or southeastern Europe. Columbus carried cattle to Caribbean islands in 1493, and by the 1520s other Spanish colonizers took them to North, Central, and South America. The Roman Catholic Church received extensive lands in Spanish Mexico, including parts of present-day Texas, California, Arizona, and New Mexico. Some missions controlled numerous peripheral *ranchos*. Nobles and soldiers also gained land grants from the Crown. Cattle were easier to establish than farms and villages, and occupying land with herds was a quick way to assert control and support ownership over large areas. Cattle were fenced out of gardens and grain fields to forage on unimproved open range. From a few hundred animals, Spanish colonial herds increased to hundreds of thousands, with some cattle escaping to live wild. Rancho cattle were tended by an ethnically mixed economic underclass, including slaves from cattle-raising African tribes. For the most part, cattle ran practically wild, and roundups resembled hunts. Until the early 1800s, since Spaniards preferred mutton to beef, the major products from

➤ JOHN WESLEY POWELL AND RANGELANDS

During the Civil War, the Homestead Act gave 160 acres (65 hectares) of western public land to adults who had “never borne arms against the United States” in return for occupying and farming it for five years. But the region was poorly understood. Despite local boosters’ claims to the contrary, much of the land was unfit for farming. Beginning in 1867, geologist John Wesley Powell explored the Rocky Mountains by boating the Colorado River and its upper basin tributaries. Powell quickly realized that most of the American West could support livestock but not farming. His 1879 “Report on the Lands of the Arid Regions of the United States” and later papers urged increased rangeland homesteading acreages, organizing watersheds with cooperative irrigation schemes, and providing government with natural resources reports. Powell became director of the U.S. Geological Survey, but his ideas were considered radical, and most were politically opposed. In 1909 and 1916 allowable rangeland homesteads were finally expanded to 320 and then 640 acres (130 and 260 hectares, respectively), still inadequate for profitable ranching in much of the arid West.

—Matthew Chew

John Wesley Powell, U.S. explorer, soldier, and geologist. In 1869 he led an expedition down the Green and Colorado rivers that passed through the Grand Canyon. (Library of Congress)

Spanish cattle were hides and tallow, easily preserved and shipped.

English, Dutch, and French colonists also brought cattle. Before and after the American Revolution, raising livestock was a frontier activity, gradually moving westward into Indian lands ahead of farming and town settlement. As in the Spanish colonies, cattle were tended by poor people with little prospect of economic advancement. After Mexican independence from Spain in 1821, Anglos from the United States began to settle in Texas, where many assembled herds from wild Spanish cattle. As the U.S. frontier moved westward and the Mexican frontier moved northward, technologies, practices, and

peoples mixed. The lasso, boots, wide-brimmed hats, and horned saddle all became more standardized. An itinerant landless underclass, or cowboy proletariat, began to emerge. Living rough, dangerous, and often short lives, few of these men resembled movie stars.

Ranching was a boom-and-bust business. The California and South Dakota gold rushes brought booms; bad weather, Indian raids, market hunting, and eastern farm competition brought busts. The most sophisticated ranch operators tapped European and eastern U.S. investors as sources of relatively inexpensive operating capital. During the Civil War, Texas ranches openly sold cattle to Union customers and smuggled them

to the Confederacy to avoid Union reprisals. After the war, government incentives, homesteaders, and massive private investment in mining companies, telegraph lines, and railroads helped provide new markets and transportation opportunities for cattlemen. Simultaneously, however, the growing demand for hides and meat drove ranchers to more remote areas because of land-use conflicts with farmers and townspeople.

In the early 1880s, cattle prices were high and rains were good, so herd sizes drastically increased. By the late 1880s, however, hard winters and droughts destroyed many herds. The fact that a large ranch could produce animals at a cheaper price per head than smaller operations, the luck of having arrived first to homestead at critical watering sites, ruthless business practices, and political connections combined to allow some ranchers and syndicates to consolidate holdings, forcing out marginal competitors. Some exploited huge areas of government-owned no-man's land. But American settlers continued to migrate westward, and ranching retreated to ever more remote and marginal lands. In the mid-1870s, newly invented barbed wire fencing helped ranchers to quickly and

cheaply establish land boundaries. Irrigation projects large and small made former rangelands farmable. Improving railroads opened more eastern markets to western products and carried civilized people and amenities westward.

Ranching contributed significantly to the opening of the American West. Ranchers and cowboys became symbols of perseverance and self-sufficiency. Later innovations such as highway transportation, mechanical refrigeration, and advanced veterinary medicine have changed the way ranchers do business, but converting grass into animals remains a way to make a living from otherwise marginal lands.

■ Introduction: Disease Epidemics and Human Response

By the eighteenth century the Afro-Eurasian plague pandemic of the 1300s had become a distant memory, and the wave of epidemics that had swept through the Americas during the Age of Exploration had finally subsided. Infectious diseases continued to be the major cause of deaths, with some, such as smallpox, especially deadly. In the 1700s smallpox killed millions, including an estimated 400,000 Europeans, among whom were an Austrian emperor, a Russian tsar, a Swedish queen, and kings of France and Spain. But by the 1700s even smallpox had become endemic, that is, constantly present in a population, with mortality rates more or less constant from year to year. Epidemics occurred, but they tended to be localized and of short duration. In the Western world, for example, smallpox epidemics were limited

to Iceland in 1707-1708 and Boston in 1720 and 1730. The plague struck Marseilles in 1720, killing almost half its residents, and Moscow in 1770-1771, where it claimed 50,000 victims. A virulent strain of influenza swept through Europe in 1781-1782, and an outbreak of yellow fever in Philadelphia killed several thousand in 1793. This pattern of brief localized epidemics, which also was the norm in Asia and Africa, was a far cry from the devastating pandemics of the past.

What might have been the beginning of a new phase in humanity's relationship with disease-causing organisms was cut short, however, in the nineteenth century, when epidemics became more lethal and global. Increased migration and trade, new and faster means of travel, and imperialism all promoted the spread

of disease-causing bacteria, viruses, and parasites as a result of increased contact among the world's peoples. Urbanization also contributed. Urbanization meant increased susceptibility to disease as a result of overcrowding, contaminated water supplies, and inadequate systems for disposing of human waste and garbage.

Deadly epidemics affected every part of the globe. Worldwide influenza epidemics occurred in 1847–1848, 1857–1859, and 1889–1892. In the late nineteenth century the world experienced its third bubonic plague pandemic, one that greatly exceeded the sixth-century Plague of Justinian and the fourteenth-century Black Death in geographical scope. Having begun in southwestern China in the 1850s, it spread gradually throughout China and reached the major port cities of Guangzhou and Hong Kong in 1894. From there international shipping carried the disease to port cities on every continent, resulting in a pandemic that killed approximately 13 million people (mostly Chinese and Indians) and lasted well into the twentieth century. The most deadly global traveler of the era, however, was not *Yersinia pestis*, the bacterium that causes plague, but rather *Vibrio cholerae*, the cause of cholera. This lethal infection of the small intestine, capable of causing death in hours after its onset, was endemic to India but in the nineteenth century spread around the world, causing no fewer than six pandemics between 1816 and the first years of the twentieth century. How many succumbed to cholera in the 1800s will never be known, but the number of deaths might well have reached 35 million to 45 million. Not just human beings experienced mass die-offs. In 1889 cattle shipped to Africa from India introduced rinderpest, a highly contagious viral disease, resulting in an epidemic in which an astounding 90 percent of all cattle died in sub-Saharan Africa. Famine and sleeping sickness (spread by tsetse flies that flourished when vacant pasture land reverted to brush) killed millions of Africans.

Although devastating, the upsurge in deadly epidemics is not what makes the late eighteenth century and the nineteenth century so important in the long history of humanity's struggle with disease. Of much greater consequence was a host of new treatments, preventative measures,

and scientific breakthroughs that for the first time gave humans the knowledge and means to fight against dozens of killer diseases with hope for success.

Over the centuries afflicted persons, learned scholars, illiterate peasants, practicing physicians, and public officials all had speculated about the causes of disease. Divine judgment, fate, witchcraft, foul air, moral failure on the part of the afflicted, evil winds, imbalances in bodily fluids, and poor diet were just a few of the many explanations they offered. Based on such theories, they devised preventions and treatments in ever greater numbers. Some, such as prescribing rest, quarantining new arrivals to a city during epidemics, and administering certain herbal medicines, undoubtedly did some good. Others, such as the bleedings and purgings routinely prescribed by European physicians unquestionably did great harm. Most treatments might have had some benefit by giving a sick person reason to hope but had no real medical effect one way or the other.

This changed in the eighteenth and nineteenth centuries. The worldwide acceptance of inoculation and later vaccination as a means of fighting smallpox, the increased use of quinine to treat malaria, the distribution of fresh produce (especially citrus) to prevent scurvy among sailors, and efforts to clean up urban water supplies to prevent cholera and other diseases are all examples of positive steps taken before doctors and scientists understood the true causes of disease. Such an understanding was achieved only in the closing decades of the century, when microbiologists such as Robert Koch (1843–1910) and Louis Pasteur (1822–1895) proved beyond a doubt that microorganisms (“germs”), not foul air, were the cause of infectious diseases. Their work underscored the importance of public sanitation efforts; made possible the development of vaccines to prevent rabies, diphtheria, tetanus, and typhoid fever; and made antisepsis mandatory for surgeons and midwives. Other scientists and physicians made important breakthroughs in understanding how certain diseases spread. The discovery that mosquitoes transmitted malaria and yellow fever led to mosquito-control campaigns that saved countless lives and made possible, among other things, the completion of the Panama Canal between 1904 and 1914.

It did not take long to discover that the battle against killer epidemics had not been won by 1914. Estimates of how many people died from the influenza pandemic of 1918–1919 range from 50 million to 100 million. Even if the low estimate is correct, it would make this pandemic the deadliest in history. Despite the subsequent development of new vaccines and the discovery of antibiotics in the twentieth century, human beings continue to be threatened by new diseases such as HIV/AIDS, which emerged in the 1980s, and old ones such as influenza, which in the form of swine flu gave rise to fears of a potentially devastating pandemic in 2009 and 2010. None of this should detract, however, from the important, indeed revolutionary, medical and scientific advances that occurred between 1750 and 1914.

—James H. Overfield

The Bubonic and Pneumonic Plague

Living in the guts of fleas and transmitted to rodents and humans by a flea bite, the bacterium *Yersinia pestis* causes plague. The fleas live on rats and, once infested with the bacterium, transmit it to their hosts. When large numbers of rats die, fleas seek a secondary host and, finding it in humans, infect them with plague. Symptoms include stupor, high fever, chills, and headache. Within six days of infection, lymph nodes swell under the arms or in the neck or groin. These swellings, known as buboes, give bubonic plague its name. Bubonic plague kills 60–90 percent of its victims when untreated. When the plague bacillus enters the lungs, victims can transmit the disease by coughing. This highly contagious form of plague, pneumonic, is nearly always fatal when untreated.

An ancient disease, plague erupted in the sixth century CE in Byzantium, in the fourteenth century in Eurasia, and between the eighteenth and twentieth centuries worldwide. This last outbreak, the third plague pandemic, killed 13 million people in the nineteenth century alone. Plague appeared in the Middle East and the Ottoman empire in the 1770s. These isolated flare-ups of plague died out, but in the nineteenth century the disease became active in China. In

1855 a military revolt in Yunnan prompted the emperor to dispatch troops to quell the uprising. In their march soldiers crossed the Salween River, whose surrounding land had plague-carrying rats. Infected by the disease, these soldiers transmitted plague wherever they went. During the next 40 years, plague devastated large areas of China, reaching Guangzhou and Hong Kong in 1894. Within a decade of its arrival in Hong Kong, plague afflicted the world's major seaports. During its global spread, plague infected several species of rodents in addition to rats, notably squirrels in San Francisco (1900) and marmots in Manchuria (1911).

Alarmed, Japanese and European authorities worked to combat the disease, sending Japanese physician Shibasaburo Kitasato and French physician Alexandre Yersin to Hong Kong in 1894. Both scientists isolated the plague bacillus in the blood of human corpses and dead rats. Yersin used the bacillus to infect mice and guinea pigs, proving it to be the cause of plague. Kitasato published his findings a few weeks before Yersin and thus has received credit for discovering the bacillus. As important as the discovery of the bacterium was, it left unclear how plague spread from rodents to humans. Japanese physician Masanori Ogata, working in Formosa (present-day Taiwan), made the link in 1897, identifying the plague bacillus in fleas. During the next decade, scientists isolated two strains of the plague bacterium, one endemic to northern Asia and central Africa and the second endemic to India, Sri Lanka, and the seaports infected worldwide.

In combating plague, Kitasato championed a cleanliness campaign involving disinfection

➤ PLAGUE IN HAWAII

Probably originating in Hong Kong, plague reached Hawaii in 1899. That summer, Honolulu's Board of Health detained several ill sailors from Japan and Hong Kong. All died under mysterious circumstances perhaps of plague. Chinese physician Li Fai, who had witnessed plague firsthand in Hong Kong, reported the first plague death in Honolulu in December 1899. Four additional cases in the following days raised fears of an outbreak. All of these cases originated in Chinatown, leading white elites to blame Chinese newcomers for the disease. A three-man commission, established by Hawaii's attorney general, blamed the Chinese for living in filthy overcrowded conditions. The commission called for isolation of the sick but took no notice of the rats and fleas that transmitted the disease. The Board of Health dispatched work crews to disinfect homes with carbolic and sulfuric acid, a practice reminiscent of the cleanliness campaigns elsewhere. The board closed schools and churches, banned public gatherings, and burned condemned houses, leaving hundreds homeless in Chinatown. Recognizing the centrality of rats to plague's spread through Honolulu, the Board of Health offered 25 cents to anyone who found a rat, alive or dead. Knowing that the Chinese, fearing the intrusion of whites into their lives, were concealing plague victims, the board offered \$100 to anyone who reported a case of plague. By the board's orders, Chinese who worked in the homes of whites had to shower in public every morning before work lest they transmit the disease to whites. Most of these measures stressed sanitation and cleanliness, an approach that, doing little to eliminate rats and fleas, did not save Honolulu from plague. Between December 1899 and March 1900, physicians reported 71 cases of plague in Honolulu. Sixty-one died, and of these 41 lived in or near Chinatown.

—*Christopher Cumo*

of homes, the trapping and killing of rats, isolation of the sick, and deep burial of the dead in quicklime. Physicians who thought that filth caused plague likewise favored a cleanliness campaign. The fact that many people, especially the poor, lived in squalor seemed to confirm the filth hypothesis. Concurring with Kitasato in February 1897, British authorities in Bombay

(present-day Mumbai) hired 30,966 people to disinfect homes by spraying carbolic acid, mercuric chloride, and quicklime on roofs, walls, and floors. Their homes inundated, homeowners complained that these chemicals ruined their belongings. In some cases work crews nearly dismantled the badly constructed homes of the poor in search of rats. Running through sewers, the disinfectants flushed rats out of their burrows, sending them into other homes and perhaps abetting the spread of plague in the city. Spreading through the subcontinent, plague killed 6 million Indians between 1898 and 1908. The cleanliness campaign had failed. Worse, the work crews that cleaned up dead rats suffered high mortality, making the cleanliness campaign hazardous to the people who did the work of combating plague.

A few physicians held to the old miasma hypothesis. Corrupt air, they believed, caused plague. The putrid odors from rubbish heaps in many cities seemed to confirm this hypothesis, although it was difficult to reconcile the hypothesis with the fact that people who lived several blocks from the trash piles were also vulnerable to plague. Other physicians identified plague as a contagion, as a disease that is transmitted via person-to-person contact. These physicians were not far from the truth, for pneumonic plague is a contagion although bubonic plague is not. Other physicians asserted, despite the findings of Kitasato and Yersin, that plague spread from infected soil to the feet, penetrating the skin and thereby infecting its victims. Still others contended that humans contracted plague by eating contaminated food. In 1898 the Plague Research Commission falsified these claims. Attacking plague from another angle, British medical officer Richard Strong began in 1906 to use solutions of dead plague bacteria as a vaccine, but his efforts failed. Only in the 1930s would bacteriologists develop a vaccine against plague.

At first physicians puzzled over the seasonal variation in plague outbreaks. In the spring the number of plague cases increased rapidly before falling precipitously in the summer. This pattern was due to rainfall. Abundant rainfall in spring drove rats, along with their disease, from the sewers into homes in search of shelter. The onset of dry conditions in summer encouraged

rats to return to their burrows, minimizing their contact with humans.

According to one authority, plague spread around the world because steamships carried rats and thereby plague farther and faster than had sailing ships. In the age of sail, plague ran its course through the rats aboard ship before a ship made land. Steamships, however, larger than sailing ships, had a larger number of rats. Plague remained virulent for the comparatively brief voyages from port to port. Moreover, cities grew rapidly during the nineteenth century, providing a habitat for plague-carrying rats. During the third pandemic, mortality was higher in cities than in the countryside. Among farming communities, plague was infrequent because the plowing of land destroyed rat burrows.

Europeans, who had been victims of earlier plagues, were remarkably free from the ravages of the third pandemic. Houses of brick walls and tiled roofs were harder for rats to penetrate than were houses of wooden walls and thatch roofs. A more regular supply dissuaded Europeans from hoarding food against lean times. Without food to eat, rats had little incentive to invade the homes of Europeans. Finally, during the eighteenth century brown rats replaced black rats throughout Europe. Unlike black rats, the brown rat avoided humans and so did not spread its diseases to them.

Plague abated in the twentieth century with the discovery of antibiotics and the development of a plague vaccine. Before these breakthroughs, plague had been a scourge of humanity. It killed the poor disproportionately, crammed as they were into vile quarters. The filth of their homes undoubtedly attracted rats, although outside the medical community few people connected rats, fleas, and people as transmitters and recipients of plague. Instead, they blamed the gods.

Understanding the Plague

Plague is a zoonosis, an infectious disease that normally infects animals but occasionally crosses the species barrier to cause human disease. The worldwide human death toll from plague throughout history is estimated at around 200 million. It has been associated with three major pandemics. The first, during the sixth century CE, became known as the Plague of Justinian, named after the eastern Roman emperor Justinian I (r. 527–565) who himself contracted the disease. Plague is thought to have started in Egypt, from where it spread by ship to Constantinople, the Near East, northern Africa, Europe, and central and southern Asia. An estimated 100 million people were infected, and as many as 40 million may have died. The second pandemic, often referred to as the Black Death, occurred in the fourteenth century and caused 50 million human fatalities. It is thought to have begun in central Asia and spread across Eurasia and into parts of Africa. One-third to one-fourth of Europe's population is estimated to have died during this second pandemic.

The third pandemic started around 1855 in the Chinese province of Yunnan, from where it spread to many parts of China and reached Hong Kong and Guangzhou in 1894 and Singapore and Bombay (present-day Mumbai) in 1896. It is estimated that during the first two decades of the twentieth century, over 12 million people died in India alone as a result of plague. The disease also spread to Southeast Asia, South Africa, Madagascar, North America, and South America via steam ships. In late 1899, plague was introduced to Honolulu by ships arriving from Hong Kong. In 1900 it was reported in San Francisco, and in 1901 it was reported in Cape Town, South Africa. Subsequently, the disease became established in the western and southwestern United States, where it still persists.

Before the etiologic agent of the plague was discovered, theories about the disease's causes abounded. Dating back to the Middle Ages, one theory linked the disease to bad air, which entered the lungs and caused the disease in the blood. There were many theories about what caused the bad air, including the alignment of planets, the phases of the moon, or divine intervention. In several medieval European cities, people blamed

and murdered Jews, who were accused of poisoning wells, while others sought to placate God by organizing processions of flagellants.

Only during the third pandemic were the true causes of the plague discovered. The two major advances were the discoveries of the pathogen that causes this disease and the nature of its transmission. The etiologic agent of plague is the bacillus *Yersinia pestis*, which, based on its biochemical and metabolic characteristics, has been classified into three biovars, or groups. The group that caused the third pandemic is called *Orientalis*. Its complex life cycle involves a rodent host that functions as a natural reservoir and a flea that represents the transmission vector. During their blood meals, infected fleas transmit the pathogen between rodents and can also infect humans, which represent accidental hosts. In several medieval plague epidemics, it was reported that finding large numbers of dead rats was shortly followed by human outbreaks. In this context, it is important to note that efforts to indiscriminately eradicate rats were often followed by outbreaks in the human population. This is explained by the fact that in the absence of rats, infected fleas were seeking alternate hosts and started more frequently biting and infecting humans.

Yersinia pestis was identified and isolated in Hong Kong, during the third pandemic, by two researchers working independently: Alexandre Yersin, a Swiss-born French physician who previously had worked at the Pasteur Institute in Paris and was trained by Louis Pasteur, and Shibasaburo Kitasato, a German-trained Japanese bacteriologist who studied in Berlin with Robert Koch. Both men arrived in Hong Kong in June 1894, a few days apart from each other. Kitasato, leading a team of six researchers, was received with hospitality by the local government. Yersin, accompanied by only two aides, one of whom soon abandoned him, was much less well equipped technically and received a cooler welcome. Yersin identified bacilli from buboes and lymph nodes of infected patients and from the blood of patients with very severe disease and was able to culture and examine under the microscope material isolated from the buboes. Kitasato found bacilli in the blood of several patients he examined and reported that the same

organism was present in buboes and in internal organs examined during autopsies.

Within a few months both investigators were able to publish their findings. Kitasato published his findings in the British journal *The Lancet* in August 1894, while Yersin published his discovery a month later in *Annales de L'Institut Pasteur*. Even though the two investigators offered similar descriptions of the pathogen, several differences exist between their reports, and despite the fact that Yersin arrived in Hong Kong a few days later, was less well equipped, and published his findings later, he provided a more accurate description of the pathogen. Kitasato described this nonmotile bacterium as slightly motile, while Yersin did not comment on this characteristic. In addition, Yersin correctly described the microorganism as Gram-negative, which means that the bacterium does not retain a crystal violet dye during the staining procedure used to classify bacteria based on structural particularities of the cell wall; Kitasato's article was not conclusive on this point. This subsequently led some investigators, more recently, to raise the possibility that Kitasato's samples might have been contaminated with another microorganism, such as pneumococcus, the etiologic agent of bacterial pneumonia, and it was in fact well known that many plague victims had secondary infections with this pathogen. They have questioned whether he had, in fact, correctly identified *Yersinia*. Yersin also noticed large numbers of dead rats throughout Hong Kong and was the first the one to propose, in 1897, that a connection exists between rats and the plague.

After its discovery, the bacillus that causes plague was known under different names, including *Bacterium pestis*, *Bacillus pestis*, *Pasteurella pestis*, and *Pestisella pestis*. Yersin's more accurate scientific description resulted in the pathogen being called, in 1954, *Yersinia pestis*. In 1897 Masanori Ogata, a Japanese physician working in Taiwan, and a year later Paul-Louis Simond, a French bacteriologist working in Bombay, were the first ones to independently propose that fleas are important in plague transmission. Both reported that humans with plague often had previously been bitten by fleas and, in addition, that rats developed symptoms similar to those in humans. When the investigators

prepared extracts from fleas and injected them into healthy rats, they observed that the animals developed plague. Another one of Simond's important findings was that in the absence of fleas, plague cannot be transmitted from infected rats to healthy ones.

In 1896 Waldemar Mordecai Haffkine, a Russian bacteriologist who studied with Nobel Prize laureate Ilya Mechnikov and was in Calcutta working on a cholera vaccine, developed the first heat-killed vaccine against plague that was widely used in India. Haffkine, credited with developing the first effective human vaccination against a bacterial infection, injected himself with the vaccine. Subsequently, several trials revealed that it was a success. When, in 1902, 19 individuals in an Indian village developed tetanus subsequent to vaccination and died a few days later, Haffkine was held responsible and was suspended from his position as director of the Plague Research Laboratory in Bombay. A report, released a few years later, provided strong evidence pointing toward the fact that contamination occurred when the vaccine bottles were opened under nonsterile conditions; Haffkine was exonerated and became the director of the Biological Laboratories at the Presidency General Hospital in Calcutta. In his honor, the Plague Research Laboratory, which in 1905 became the Bombay Bacteriological Institute, was renamed the Haffkine Institute in 1925. It remains an important public health establishment.

Smallpox

The period 1750–1914 saw a tremendous change in the effects of smallpox on human populations. At the start of this period smallpox was an endemic disease in most of the world, and periodic epidemics were responsible for hundreds of thousands to millions of deaths. Among survivors, blindness and disfigurement were common. However, by the early twentieth century the development and use of the smallpox vaccine had worldwide impacts on mortality.

Smallpox is an infectious disease caused by the variola virus, a double-stranded DNA virus that affects only humans. There are two forms of smallpox infection: *variola major*, the more common and more severe form, with mortality rates of approximately 30 percent, and *variola minor*, which is less common and has much lower associated mortality.

In the late eighteenth century smallpox was responsible for 400,000 deaths per year in Europe, possibly accounting for 10 percent of all European deaths. Severe smallpox epidemics that took place in Germany in 1766, 1786, and 1801 were responsible for more than 20 percent of all deaths in cities such as Berlin. In eighteenth-century England, 80 percent of deaths from smallpox were in children younger than five years old.

In some regions, smallpox was not equally distributed in all populations. In eighteenth-century China, smallpox was more common among the Han Chinese majority population (many of whom were infected as children) than among the ruling Manchus. Fearing smallpox infections, members of the ruling group established isolated lodgings to protect important individuals from exposure to smallpox, implemented a system to identify smallpox patients, and ordered infected individuals to leave the capital. These actions increased tensions between the Manchu and Han. Representatives from foreign states were ordered by the emperor not to travel to Beijing unless they already had been infected.

Other major disruptions that weakened the general health of populations also increased

▶ SMALLPOX AS A WEAPON

Smallpox has been used as a weapon for hundreds of years. In the fourteenth century, Tartar forces used catapults to send bodies of smallpox victims into towns to infect the defending populations. An often-cited use of smallpox as a weapon was in the British North American colonies in 1763. In May, a confederation of Delaware, Shawnee, and Mingo tribes led by the Ottawa leader Pontiac began a siege of the British Fort Pitt in western Pennsylvania. Smallpox was reported to be present in the fort in June. Following an unsuccessful conference to resolve the siege, William Trent (a trader and captain of a militia company at Fort Pitt) wrote that two Indian representatives were given “two Blankets and an Handkerchief out of the Small Pox Hospital,” presumably with the intent of causing smallpox among the siege forces. Large numbers of deaths due to smallpox were reported among these tribes in 1764–1765. However, it is unknown whether these were due to the transfer of smallpox-infected materials from the British, as smallpox epidemics had also been reported among these tribes earlier in 1763. During the American Revolutionary War (1775–1783) the British were accused of using smallpox against the Continental Army. The Geneva Protocol of 1925 prohibited the use of bacteriological (biological) weapons.

—Michael Halpern

their susceptibility to smallpox. In the Sudan during the period from 1885 to 1899 wars, food shortages, and large population movements resulted in more frequent epidemics. Famine in the Bengal region of India was also reported to increase the fatality rate of smallpox epidemics during the late 1700s.

Individuals who survived smallpox infections were immune to subsequent smallpox infections. An early treatment to prevent smallpox was variolation, in which healthy individuals were exposed to infectious materials such as pus or scabs from survivors with mild smallpox cases. The goal was to cause a mild case of the disease and subsequent immunity in treated individuals, but variolation also could cause severe and potentially fatal smallpox infections. Patients who were treated by variolation could also spread the virus to others while they had

active infections in the same way as those who had been infected naturally. Variolation had been used for centuries in China, India, and the Ottoman empire. This technique was disseminated in 1721 in England by Lady Mary Wortley Montague, who had learned of variolation while her husband served as the British ambassador in Istanbul; the procedure gained rapid acceptance shortly thereafter. Also in 1721, the first variolation in America was performed in Boston by Dr. Zabdiel Boylston (1676 or 1679–1766) at the urging of the prominent clergyman Reverend Cotton Mather, who had learned of this technique from his slave Onesimus.

Unlike variolation, vaccination involves immunizing healthy individuals with antigenic materials to prevent smallpox infections without actually causing smallpox. The first widely used smallpox vaccine was developed by the English doctor Edward Jenner (1749–1823) in the late eighteenth century, using pus from individuals who had contracted cowpox. Cowpox was an infectious disease common among milkmaids; it was related to smallpox but resulted in mild symptoms. Individuals infected with cowpox became immune to smallpox (the term “vaccination” is derived from the Latin word for “cow,” *vacca*). Jenner published a paper on his initial vaccine tests in 1798. Although initially there were strong negative reactions to Jenner’s work, including from medical professionals who supported variolation, use of the Jenner vaccine spread quickly; approximately 100,000 individuals in the United Kingdom were vaccinated within two to three years following publication of Jenner’s paper.

Dr. John Clinch (1749–1819) performed what may have been the first smallpox vaccination in North America (in Newfoundland, Canada) around 1799, using material supplied by Jenner. The Boston physician and Harvard professor Benjamin Waterhouse (1754–1846) performed the first vaccinations in the United States. Subsequently, using material supplied by Waterhouse, President Thomas Jefferson vaccinated a number of his own family members. Spanish authorities were able to transport vaccine materials to South America and the Philippines starting in 1803 by vaccinating pairs of orphan boys every ten days onboard a ship, the *Maria Pita*, using

lymph gathered from a previously vaccinated pair. In 1804 a wealthy Brazilian landowner sent slaves to Lisbon to be treated with the Jenner vaccine. The slaves then returned to Brazil as human reservoirs for subsequent vaccinations. Arm-to-arm vaccination (i.e., using materials that came directly from previously vaccinated individuals) continued to be practiced until the 1880s, when calf lymph suspended in glycol was developed as a source for vaccinations.

Mandatory vaccination laws were passed in the early 1800s in several European countries. The United Kingdom passed its first Vaccination Act in 1840, providing free smallpox vaccinations to the poor and outlawing variolation; the 1853 Vaccination Act made smallpox vaccination mandatory for all British infants. The incidence of smallpox and smallpox mortality decreased substantially in populations required to be vaccinated. For example, an 1855 law in Boston required children to receive the smallpox vaccination to attend public school. A review of 700 smallpox cases seen during an epidemic in Boston in 1901 showed that 19 percent occurred among children ages one to five years old (who, being too young for public school, were not required to be vaccinated), but only 3 percent occurred among children ages six to ten. Despite evidence for the effectiveness of smallpox vaccination, there were numerous challenges to mandatory vaccination. In 1905 the U.S. Supreme Court supported Massachusetts's mandatory vaccination law, ruling that states can pass such laws to protect the public from dangerous communicable diseases. The British vaccination act was amended in 1907 to permit parents to refuse to have their children vaccinated on moral or religious grounds. While mandatory smallpox vaccination has been discontinued worldwide due to the eradication of this disease (the last case in the United States was in 1949, while the last naturally occurring case in the world was in Somalia in 1977), disputes regarding mandatory vaccination for other communicable disease continue today.

The Campaigns for Inoculation against Smallpox

Inoculation is the deliberate exposure of a person to a disease, often by inserting infectious material under the skin (see sidebar), with the intention of producing immunity. Inoculation to prevent smallpox may have been introduced in China or India as early as the third century CE and certainly was practiced in these regions and the Ottoman Empire in the early modern period. Inoculation with the smallpox virus was introduced in England in the eighteenth century with the demonstration to the scientific world by the English country doctor Edward Jenner (1749–1823) in 1796 that infection with cowpox, a relatively benign disease, conferred immunity from smallpox. Jenner published his observations on the relationship between cowpox and smallpox in *An Inquiry into the Causes and Effects of the Variolae Vaccinae, a Disease Discovered in Some of the Western Countries of England, Particularly Gloucestershire and Known by*

➤ INOCULATION, VARIOLATION, VACCINATION, AND IMMUNIZATION

The terms “inoculation,” “vaccination,” and “immunization” are often used synonymously today to refer to techniques of creating immunity to disease through deliberate exposure to infective material, but they do have distinct meanings. Immunization is the broadest term and means to protect from disease through introduction of a weakened organism or toxin. Inoculation strictly speaking refers to the practice of inserting infectious material under the skin. Variolation, from the Latin name for smallpox, *variola*, refers to inoculation against smallpox. The term “vaccination” was coined by Edward Jenner to refer to inoculation with cowpox and comes from *vacca*, Latin for cow.

—Sarah Boslaugh

the Name of the Coxpox (London: Sampson Low, 1798). The book was extremely successful and helped to popularize the idea of inoculation with cowpox, often called “vaccination” after the Latin word *vacca*, meaning cow, as protection against smallpox. Despite some religious opposition and some skepticism about Jenner’s procedure from some segments of the medical community, the benefits of vaccination ensured its spread throughout the Western world. Vaccination was performed in most European countries and in the United States by the early 1800s. However, at first administration of the vaccine was voluntary and was not universally available.

The concept of vaccination as a public health measure, rather than a medical decision to be left up to each individual, led to universal compulsory vaccination in many countries. The Scandinavian countries were first, beginning with Denmark in 1810, Norway in 1811, and Sweden in 1816. Other countries followed, including Prussia in 1835 and England in 1853. In the United States, a 1905 court ruling established the principle that the state could require individuals to be vaccinated for the common good. However, while most of Europe became free of smallpox in the early twentieth century, smallpox remained endemic in a number of countries, and it is estimated that there were 10–15 million smallpox

Edward Jenner was an English physician who discovered the first vaccine for smallpox. (Jupiterimages)

cases in 31 countries as late as 1967. Due to intensified mass vaccination efforts in those remaining countries, the last naturally occurring case of smallpox was observed in Somalia in 1977, and in 1980 the World Health Organization declared that smallpox had been eradicated.

Yellow Fever

From the eighteenth to the early twentieth centuries, yellow fever was one of the most feared epidemic diseases. Yellow fever is caused by a virus and is transmitted to humans by the *Aedes aegypti* mosquito. Although primarily a tropical disease, yellow fever caused devastating epidemics in many North American cities. The first symptoms of the disease, which include fever, chills, headache, and vomiting, were often mistaken for malaria, influenza, or dengue fever. In severe cases, victims experienced high fever, black vomit, jaundice, convulsions, and delirium. Death might result from damage to the liver, kidneys, and heart. Determining the mortality rate of yellow fever is difficult because mild cases may not be diagnosed, but it is probably about 20 percent.

Historians have disagreed about whether yellow fever originated in the New World or was endemic in Africa and did not reach the Americas until the seventeenth century. Evidence for the existence of particular diseases and insect vectors in pre-Columbian America remains ambiguous, but modern immunological and entomological studies support the theory that the yellow fever virus originated in Africa.

Yellow fever as well as *Aedes aegypti*, were probably imported into the Western Hemisphere in the seventeenth century in ships transporting

slaves to the West Indies. Outbreaks of yellow fever occurred in Barbados and Cuba in the 1640s, followed by increasingly widespread epidemics. In 1802, an army of 40,000 sent by Napoleon to Haiti to suppress the Haitian Revolution was wiped out by an epidemic of yellow fever, and fear of the disease was a major factor in the French decision to abandon efforts to recapture Haiti.

Yellow fever epidemics occurred in many American cities, including New Orleans, Savannah, Baltimore, New York, and Philadelphia. The devastating epidemic that struck Philadelphia in 1793, killing at least 4,000 of the city's approximately 40,000 inhabitants, has been of particular interest to historians. Benjamin Rush (1745–1813), patriot and physician, blamed the outbreak on noxious effluvia generated by sacks of coffee putrefying on the city wharf and treated his patients with bloodletting. Debates about the proper response to the epidemic became embroiled in political conflicts. Some observers blamed the epidemic on the influx of Haitian refugees, while others insisted that the epidemic was caused by unsanitary local conditions.

Yellow fever became a disease of special interest to the United States as a result of the Spanish American War and the subsequent occupation of Cuba. In 1900, Walter Reed (1851–1902), James Carroll (1854–1907), Jesse W. Lazear (1866–1900), and Aristides Agramonte

► WALTER REED—CONQUEROR OF THE YELLOW FEVER

Walter Reed was born on September 13, 1851, in a small country home at Belroi, Virginia, the son of a minister of the Methodist Episcopal Church. A graduate of the University of Virginia School of Medicine, Reed received further training at the Bellevue Hospital Medical College in New York City. In 1875 he was commissioned a first lieutenant in the U.S. Army Medical Corps as an assistant surgeon. After postings in Arizona, Alabama, and South Dakota, in 1893 he accepted a post as professor of clinical microscopy at the Army Medical School in Washington, D.C., while holding the chair of bacteriology at Columbia University (now George Washington University). After the Spanish-American War he was appointed head of

the Yellow Fever Commission, and as a result of his experiments he and his assistants definitively proved that yellow fever was caused by the bite of a mosquito rather than by contact. The subsequent clearing of mosquito-breeding areas effectively eliminated the disease in Latin America and the southeastern United States. Seven years after his death, the Walter Reed Army General Hospital, as it was then known, opened its doors on May 1, 1909, to 10 patients. Today the Walter Reed Army Medical Center is a major research institution, serving the military community in the Washington, D.C., area and around the world, admitting 16,000 patients a year.

—James H. Overfield

(1869–1931), who served as the U.S. Army Yellow Fever Commission, investigated the cause and means of transmission of the disease. The commission was influenced by Juan Carlos Finlay's (1833–1915) mosquito hypothesis. Carroll and Lazear served as human guinea pigs and contracted yellow fever from the bite of infective mosquitoes. Carroll survived, but Lazear died. An additional series of experiments unequivocally demonstrated the validity of the mosquito theory, but the virus was not isolated until 1927.

Acceptance of the mosquito theory made efforts to control yellow fever possible. William Crawford Gorgas (1854–1920) carried out a systematic attack on the disease and *Aedes aegypti* in Cuba and in the Panama Canal Zone that made completion of the canal in 1915 possible. Gorgas also helped clarify the problem of jungle yellow fever among the tree-dwelling primates of South America and Africa. Because of this animal reservoir of disease, the virus could not be eradicated, but appropriate public health measures can prevent or minimize the threat of urban epidemics.

Malaria

Malaria is a disease whose symptoms include fever, chills, darkened urine, headache, nausea, vomiting, joint pains, aches, confusion, lethargy, anemia, seizures, and in extreme cases coma and death. Protozoa of the genus *Plasmodium* cause four types of malaria, of which only one type, that caused by *Plasmodium falciparum*, is

fatal. Yet one-quarter of cases are deadly, with mortality rates high among children. Anopheles, a genus of mosquito, transmits *Plasmodium* through its bite. Once in the body, the malaria parasites congregate in the liver, where they multiply for 9 to 16 days. At the end of incubation the parasite enters the blood, feeding on the hemoglobin in red blood cells.

The term “malaria” derives from the Italian term “*mala aria*” for “bad air,” revealing that people in Europe and elsewhere initially associated the disease with foul air. But no understanding of the causes of the disease was achieved until the nineteenth century, and no effective treatment was known outside of South America, where natives of the Andean highlands mixed the ground bark of cinchona trees with water to treat the cold shivering associated with the disease. Europeans in South America were introduced to the medicinal qualities of cinchona bark quinine in the 1600s, and although they had no idea why it worked (it is now known that it contains chemical compounds that interfere with the reproduction of the parasite that causes the disease), by 1800 the use of ground cinchona bark for treatment of malaria was widespread in Europe and in parts of Africa where Europeans resided. This led to efforts to cultivate the cinchona tree in parts of the world other than Peru, but the first seeds planted on Java in the early 1800s failed to germinate, and seedlings cultivated in England were killed by insects. Although the Peruvian government in the early 1800s banned Europeans from cinchona forests in the interest of protecting its monopoly, seed smuggled out of the country in 1865 was taken to Java, and this time it grew successfully under the direction of Dutch botanists. Soon Java became the world's leading producer of cinchona bark. In 1820 French chemists Pierre Pelletier and Joseph Caventou specifically identified the antimalaria properties of cinchona bark when they isolated the crystalline alkaloid and discovered a process to extract it from the bark. They named the white powder quinine, after *quinquina*, the word used by native Peruvians for the cinchona tree.

By the late 1800s the mystery of malaria's cause was solved. Throughout most of the nineteenth century the miasma (bad air) theory had

the support of most scientists and physicians, although as early as the late 1700s a few physicians speculated that the disease was caused by some sort of parasite or the bite of mosquitoes. A promising step was taken in 1847 when German physician Heinrich Meckel noted the existence of black pigmented crystalline structures in the blood of malaria victims. In 1878 Edwin Klebs, a German pathologist, and Corrado Tommasi-Crudeli, an Italian microbiologist, published a paper in which they claimed to have isolated a bacterium that caused the black pigment associated with the disease. This view was challenged a year later by the French physician Charles Laveran, whose work on the blood samples of malaria victims in Algeria revealed the existence of microscopic parasites linked to the disease. The theory that parasites rather than a bacterium caused malaria was universally accepted by the 1890s, by which time an understanding of the parasite's life cycle also had been achieved. Meanwhile, a number of physicians, most notably the British physician Patrick Manson, had begun to suspect that the disease was spread by mosquitoes. Inspired by Manson, who incorrectly thought that malaria was contracted by drinking water that contained dead mosquitoes, another Scottish physician, Ronald Ross, proved in 1897 that the disease was transmitted by the bite of the female of the *Anopheles* species of mosquito. Independently the Italian researcher Giovanni Battista Grassi confirmed Ross's findings, and the issue of who should receive credit for the discovery was bitterly contested in the early 1900s.

Once the role of the *Anopheles* mosquito was confirmed, new methods to combat the disease were undertaken. As early as 1899, Ross instituted a cleanliness campaign in the British colony of Sierra Leone, clearing the streets of tires, bottles, cans, and anything that could hold water. Where he could not drain water he recommended pouring oil in it to kill mosquito larvae. In 1901 U.S. assistant surgeon general William Gorgas went beyond Ross's program. Dispatched to Cuba, Gorgas drained standing water, screened the windows of homes, and burned pyrethrum, an insecticide whose fumes were toxic to mosquitoes, in homes. Success in Cuba led Gorgas to Panama, where the United States

was digging the Panama Canal. Between 1905 and 1910 Gorgas ordered the cutting of grass and brush to a height less than 1 foot (0.3 meters) in the belief that mosquitoes would not fly across large stretches of open ground. Moreover, he ordered the draining of all standing water within 200 yards (183 meters) of a village and within 100 yards (91 meters) of an isolated home. Where drainage was impractical he added larvicide to water. By Gorgas's order, all canal workers received free quinine. Because of these efforts, the death rate from malaria fell by a factor of ten in Panama between 1906 and 1909.

After World War II malaria was eliminated from much of the world under the direction of the World Health Organization. Since then it has returned as a major killer, with between 1.5 million and 3 million people dying from the disease per year. The reasons for the disease's resurgence include laxity in antimalarial campaigns; poverty and deteriorating health systems, especially in Africa; drug and insecticide resistance; global warming (which increases the breeding and life span of *Anopheles*); and increasing migration and other forms of global interaction (which spread the disease).

Cholera

While working in India in 1563, the Portuguese doctor Garcia de Orta became the first person to diagnose a cholera epidemic. Records of death due to dehydrating diarrhea date back much further, however, suggesting that the disease was likely present in India for hundreds of years before de Orta issued his report. Little was known about the disease until the nineteenth century, however, when physicians defined cholera as an

This sketch, "Death's Dispensary," was drawn by George Pinwell in 1866, twelve years after John Snow traced the cholera epidemic in Soho, London to a public pump that drew water from a sewage-filled spring. (Centers for Disease Control and Prevention)

acute bacterial disease that affects the intestinal tract and is caused by the bacterium *Vibrio cholerae*.

Scattered cholera epidemics sprang up throughout the seventeenth and eighteenth centuries in India, primarily in villages lining the contaminated Ganges River. In 1816 the scattered epidemics coalesced into the world's first of seven cholera pandemics, clusters of epidemics occurring simultaneously across wide geographic areas. The first pandemic lasted from 1816 to 1826, beginning in Bengal, spreading across India, and eventually reaching as far as China and the Caspian Sea. Just three years after the first pandemic ended the second pandemic began, this one lasting until 1851 and infecting Western Europe, North America, and Russia. It killed U.S. President James K. Polk, among others. The third pandemic (1852–1860) killed

more than 1 million people in Russia, while the fourth spread across Europe, North Africa, and the United States. The fifth pandemic (1881–1896) began in India, eventually reaching Western Europe, while the sixth pandemic (1899–1923) returned to Russia, and the seventh (1961–1970s) began in Indonesia, reaching Bangladesh in 1963, India in 1964, the Soviet Union in 1966, and North Africa and Italy in 1973. The organism that caused the seventh pandemic also appeared in South America in 1991.

Cholera is an implicitly social disease. The bacteria spread through social contact between both individuals and regions. Transnational and intercontinental trade routes played a primary role in disease transmission, and soldiers returning from war carried the disease with them, as did religious pilgrims. Numerous epidemics have plagued the holy city of Mecca since 1850, and Muslims making their hajj (pilgrimage) have frequently brought the disease back to their homes, spreading cholera throughout much of the Muslim world.

In the nineteenth century, cholera also emerged as a singularly frightening disease. In many cases, the disease appeared to choose its victims arbitrarily; it maintained a high fatality rate, particularly during the earlier pandemics, and often resulted in a violent and painful death. Because of these factors, cholera operated as a powerful social actor. This was particularly true among the poor, who were disproportionately affected by cholera outbreaks due to the lack of sanitation in impoverished areas. In 1830 the disease spawned a series of working-class uprisings in Russia known as the Cholera Riots. During the second pandemic, the tsarist government enacted numerous anticholera measures, including quarantines, armed cordons, and migratory restrictions. These measures stirred dissent among Russia's lower classes. Dissenting individuals spread rumors that government officials and doctors were intentionally contaminating people, and agitated mobs began raiding police departments and state hospitals and killing public officials, landowners, and other elites. Sporadic riots continued until the military suppressed the violence in 1831.

Cholera also operates as an indicator of social development. The United States and most

▶ JOHN SNOW'S FAMOUS CHOLERA MAPS

The third pandemic ravaged London from 1853 to 1854. During the two-year outbreak, the medical doctor John Snow made a series of discoveries that facilitated the rapid growth of both medical geography and epidemiology. In studying the spread of the disease, Snow mapped each cholera death in the Soho district of London on a street map. He then correlated the deaths to a water supply map, discovering that two particular companies had supplied the water to nearly all of

the epidemic's victims. After a series of scientific experiments, Snow concluded that the cholera toxin was a waterborne agent. As a result, his work contributed to a significant advancement in epidemiology and gave birth to the field of medical geography, a field utilizing spatial patterns and population-based measures of biological conditions and abnormalities to survey public health epidemics.

—Katherine Worboys

European countries have eradicated cholera through hygiene and sanitation programs, but the disease remains endemic in many impoverished nations in Latin America, Africa, and Asia.

Venereal Diseases

Despite the Scientific Revolution, venereal disease, usually understood as variations of syphilis, remained a mystery to Western medical science no less than to other medical traditions. In Europe and in England before the Victorian Era, sexual activity and diseases spread by it were discussed rather openly in society, and mercury-based remedies, such as Frenchman Jean Keyser's *dragées* (sugared almonds) and the pills and drops of the English "Dr. Leake," were openly advertised and sold. Nonetheless, diseases that polite society conveniently assumed had been contracted by men from

infected female prostitutes were sources of personal shame and stigma. Inevitably venereal diseases were linked in the public mind with libertinism, homosexual activity, and prostitution. Social commentators decried the commonplace that an unfaithful husband or once-wayward groom would not only infect his wife but also cause her to produce children scarred by so-called hereditary venereal disease. Some French moralists saw the eventual decline of French temperament as the inevitable result of contemporary trends, a fear adapted and echoed by American reformers a century later.

In 1797 crude experiments in France demonstrated that syphilis and gonorrhea were distinct diseases, and in 1837 Parisian clinician Philippe Ricord confirmed this and further refined the medical understanding of the stages of syphilis. A few years later Prussian public health reformer Rudolph Virchow discovered that syphilis is a systemic disease that affects many human organs and does not only cause localized symptoms. In 1876 researchers first documented cardiovascular syphilis, and in 1879 German Albert Neisser identified the *Gonococcus* bacterium as the pathogen causing gonorrhea, a finding that ranks among the earliest clear linkages of a particular microbe to a particular disease. As germ theory, championed and advanced by German Robert Koch, Frenchman Louis Pasteur, and their students, rolled back the once hegemonic humoral theory of disease, gonorrhea, once considered a mild inflammatory malady, was linked to other serious conditions such as arthritis, meningitis, and peritonitis.

➤ A JAPANESE PHYSICIAN ON HIS SYPHILIS PRACTICE, 1810

“When I was young I made a point of questioning those with a reputation for treating syphilis successfully, and I learned their therapeutic methods. But when I put them into practice I never obtained the desired results. . . . I collected all their theories and recipes. Every time I encountered a syphilitic I would try one of them, choosing it to suit the symptoms, but I have not found the miraculous recipe which works every time. Later I perused all the books which describe the prescriptions of the Dutch medics and I tried those too, but the outcome was no different. In the meantime I had acquired an undeserved reputation over the years and my patients grew in number day by day and month by month. Eventually I was treating more than 1,000 a year, of whom seven or eight hundred were syphilitics. Over a period of forty to fifty years I must have treated several tens of thousands. I am 70 this year, but I still have no perfect knowledge. . . . [T]his disease is increasingly difficult to cure, and nothing has changed since I was young.”

Dr. Sugita, “Nocturnal Dialogues with My Shadow,” in Claude Quétel, *History of Syphilis* (Baltimore: Johns Hopkins University Press, 1992), 115.

As medical science shed light on these diseases, the prudish nature of Victorian culture in Britain, its colonies, America, and many European societies tended to hide individual cases from public view by respecting traditional doctor-patient confidentiality. At the same time, Victorian-era reformers sought to control the scourge that many saw as rampant and destructive of the social fabric. In step with the times, Americans saw the issue not only as a medical one but also as a matter of public sanitation. Sexually transmitted diseases were associated with crowded and dirty urban centers and with the immigrants and prostitutes commonly found there. European-trained physician and reformer Prince Albert Morrow of New York sparked activity with his 1880 translation of the French *Syphilis and Marriage* by Ricord colleague

Alfred Fournier and Morrow’s own *Social Diseases and Marriage* (1904). The first international conference on venereal disease and its prevention was held in Brussels in 1899, and a second conference was held there in 1902. The first conference inspired Fournier to found the French Society for Sanitary and Moral Prophylaxis in 1901 and prompted the founding of *La syphilis*, the first journal dedicated to venereal disease. These activities spurred Morrow to write his book in 1904 and to found the American Society for Sanitary and Moral Prophylaxis in New York in 1905. Both societies harnessed the period’s optimism that state action could eventually wipe out the so-called social diseases, especially through education.

Prostitution remained at the center of the target, but responsible officials tended to be torn between regulating prostitutes to make the activity safer or abolishing them altogether. Regulation had been a typical approach in Europe since the French government had instituted it in 1800. Victorian Britons and Americans were less likely to accept such liberal notions. Regulation of prostitution not only offended Christian sensibilities but required disclosure and record keeping that seemed to violate traditional Anglo-Saxon notions of liberty.

In 1905 the German scientists Fritz Schaudinn and Eric Hoffmann discovered the spirochaete *Trepanoma* that causes syphilis, and the following year August Wassermann and his colleagues developed the diagnostic Wassermann Test for the disease. Finally, in 1909 the German Paul Ehrlich and the Japanese Sahachiro Hata landed on the successful arsenic-based magic bullet named Salvarsan, a watershed development that initiated the age of chemotherapy. But the moral reformers of the American Progressive Era only extended their crusade, often rubbing elbows with early feminists and eugenicists. Urban police departments established vice squads. In 1910 the Mann Act forbade the transport of women across state lines for immoral purposes, and branches of Morrow’s society coalesced into the American Federation for Sex Hygiene. In 1911 Standard Oil tycoon John D. Rockefeller established the Bureau for Social Hygiene as a center for scientific social and medical research, and the following year he founded the American Social Hygiene

Association, with Harvard president Charles W. Eliot as titular head.

Hansen's Disease—Incidence and Treatment

Hansen's disease, also known as leprosy, is one of the oldest and most feared diseases in human history. Comparative genomics research suggests that the bacterium that causes the disease, *mycobacterium leprae*, evolved in East Africa or South Asia before 40,000 BCE. Recent findings in paleopathology have corroborated references in the *Vedas* to indicate that lepromatous leprosy was present in India by 2000 BCE (our earliest historical record of leprosy). Most researchers agree that leprosy was then introduced to Mediterranean populations by the returning army of Alexander the Great in 327 BCE and Pompey's legions into Italy in 62 BCE, while it remained endemic in India and Asia. Yet the disease was not widespread in Europe until the Middle Ages, when expanding trade networks facilitated its spread. By this time Judeo-Christian understandings of leprosy were based on the Old Testament book of Leviticus, which asserted that those with leprosy should be sent "without the camp." The Third Lateran Council of 1179 CE, presided over by Pope Alexander III, ordered that those with the disease should be segregated from the rest of society. Leprosaria (places for care and sometimes quarantine) were soon established all over Europe, popular fear of the disease increased, and a precedent was set for connecting sinful living and leprosy. Whether those labeled as having leprosy truly had Hansen's disease remains a subject of scholarly research and debate. Nonetheless, reports of the disease declined in Europe after the fourteenth century and did not

reemerge on any large scale until the nineteenth century, when largely in the context of global colonialism it began to be perceived as an "imperial danger" by Western powers.

Mycobacterium leprae was first identified under the microscope by G. H. Armauer Hansen, a Norwegian bacteriologist, in 1873. His discovery disproved theories that leprosy was hereditary and focused research on its nature as an infectious disease and its potential cure. While the exact mode of transmission is still not understood, once entering the body the bacterium attacks the peripheral nervous system, and depending upon a person's immune response, the infection can be self-arrested or develop into the *tuberculoid* (milder) or *lepromatous* (more severe) forms. Hansen's disease is not highly contagious, but the visually disturbing symptoms of untreated leprosy have led it to be highly feared in most cultures. The incubation period for *mycobacterium leprae* is generally accepted to be three to five years of prolonged and close contact. It is rarely fatal, but because it compromises the immune system, if left untreated those with the disease are susceptible to secondary infections.

By the mid-1700s, leprosy was sporadically identified by European explorers and their ships' surgeons among the various indigenous peoples they encountered. It is likely that the disease was globalized through the expansion of maritime

➤ "LEPROSY" AND POPULAR DISCOURSE

Today, the term "leper" is considered derogatory and offensive, as it is a painful reminder to those persons with Hansen's disease of the historical and religious stigma so often attached to the disease. It should not be used in common discourse but may be used when quoting directly from historical sources or scripture. Contemporary scholars often use the terms "leprosy" and "Hansen's disease" interchangeably in their writings, as Hansen's disease denotes the disease caused by the *mycobacterium leprae*, and leprosy is understood to not only refer to the disease but also to the social and cultural construction(s) of the illness as well.

—Kerri Inglis

trade networks from regions where leprosy remained endemic (most notably, Scandinavia, North Africa, Egypt, India, and parts of Asia). In the mid-1800s, leprosy was most commonly found in the tropics and became a concern to Western powers because of its incidence among colonized populations. This concern led to public health policies and even medical treatments that relied heavily upon medieval social constructs of leprosy. In most parts of the world, quarantine was the treatment of choice. Although well intentioned, this policy was often carried out in ways that perpetuated the stigma attached to leprosy and reflected the dynamics of power and control in the colonial setting. Moreover, many came to believe that those with leprosy were in need of moral cleansing more than medical care, most of the work among the diseased being done by missionaries, missionary physicians, and religiously motivated volunteers. The leprosy settlement established in the Hawaiian Islands in 1865 is a prime example of such an approach.

The Molokai leprosy settlement was one of the most famous settlements for persons with leprosy and became a model for many others in the late nineteenth and early twentieth centuries. In Hawaii, fear of the disease resulted in the kingdom's Board of Health passing the 1865 Act to Prevent the Spread of Leprosy, which allowed the forceful removal of patients from family and homes to be quarantined on an isolated peninsula on the northern coast of the island of Molokai. Patients at first struggled to survive with inadequate food and water supplies, proper shelter, and medical care. Yet many considered the settlement on Molokai as the model to follow when dealing with leprosy—that is, quarantine—in Fiji, Tahiti, the Philippines, Guam, the Americas, Africa, and Asia. While quarantine was a rational response for those who feared the disease and hoped to stop its spread, leprosy is one of the least contagious of infectious diseases; those placed in quarantine prior to the 1900s rarely received actual medical care. For too many with Hansen's disease, quarantine meant a lifetime of isolation, exile, and abandonment.

One exception was in Norway, where Hansen and other bacteriologists continued their groundbreaking work and supported a model of quarantine that still allowed patients some

interaction with family and community. Another model was found in China, which many considered to be the main source of the disease. In their efforts to modernize and eradicate the stigma of the disease associated with their nation, the Chinese efforts to control leprosy often reflected national political movements of the time. But it was the Molokai model of leprosariums—places of isolation for those with leprosy—that were mainly found throughout the colonized world.

The involvement of the Belgian priest Father Damien de Veuster (1840–1889) at the Molokai leprosy settlement brought a great deal of international attention to the situation in Hawaii and to those suffering from the disease. The combination of Hansen's discovery and the attention afforded Damien's story motivated many to move beyond the moral constructs and seek out a cure for the disease. Throughout the late 1800s various treatments involving diet, medicinal concoctions, herbal baths, and oils were tried in diverse settings around the world. In the early 1900s many put hope in treatments involving chaulmoogra oil (a medicine from India), but the treatment was unable to cure the disease. Then, soon after the discovery of sulfone drugs in the 1920s, it was found that though not a cure, such drugs could effectively arrest the bacteria from progressing. Thus, dapsone was used widely beginning around 1950, but more recently dapsone-resistant strains of the disease have appeared. More recently, multidrug therapy has successfully been used to treat Hansen's disease, and the eradication of leprosy has become a goal of the World Health Organization.

Clean Water and Sanitation in Africa and Asia

Most public health scholars agree that the provision of clean drinking water has done more to improve the health of the general populace than any medical discovery. The major requirement to ensure clean drinking water is that a system of sewage disposal and potable (drinkable) water supply be established that prevents contamination of drinking water. Dreaded waterborne diseases such as cholera are almost unknown in the developed world today due to the development of municipal water and sewage systems. The growth of European cities in the eighteenth and nineteenth centuries made the need for such sanitary measures clear, as people living in crowded conditions provide an ideal environment for disease transmission. Regular epidemics of waterborne disease prompted what is now called the sanitation revolution in Europe and the United States. Part of this revolution was the assumption by municipalities of the responsibility for sewage disposal and water supply to the municipality.

There was similar need for sanitation in the large cities of the European colonial empires, particularly in colonies in tropical regions such as India and Nigeria. However, these reforms were instituted much later in Africa and Asia, if at all. Even today, many people in the developing world do not have a reliable source of clean drinking water. Ironically, the need for municipal water supplies and sewage systems was partially a result of European colonization, which promoted the growth of cities as centers of government and trade in regions where most of the population had lived in rural areas.

Scholars differ as to whether the efforts of colonial medicine and public health made the conditions of native peoples better or worse. Certainly the primary purpose in instituting sanitary campaigns was to safeguard the health of the Europeans and secondarily that of the native labor force. The public interest in sanitation was sometimes used as a pretext to institute or codify the segregation of native peoples from colonial settlers. Colonization also introduced new diseases and created the ideal environment for their transmission by creating crowded cities

THE SANITATION SYNDROME—PUBLIC HEALTH MEASURES AS TOOLS OF REPRESSION

Sanitation is a public good that theoretically benefits everyone. However, as Maynard N. Swanson argues in a much-cited article, the legitimate public interest in controlling infectious disease was used as justification for imposing segregation in the Cape Colony (South Africa) in the early twentieth century. Measures imposed ostensibly for purposes of public health included mass removal of nonwhite persons and restriction of their movement through institution of the pass system. Swanson and later authors further argue that nonwhite persons and settlements were often discussed as vectors of disease and that public health efforts frequently focused on segregating them from white people rather than improving sanitary conditions in their neighborhoods.

—Sarah Boslaugh

without the necessary sanitary infrastructure. On the other hand, colonialism did introduce many features of modern medicine and public health to countries earlier than they might have otherwise been known there. Furthermore, the infrastructure of the public health system today in many former colonies can be traced back to that established by the former colonial powers.

The case of cholera in India is a prime example of how sanitary measures were instituted first for the protection of colonial officers, in this case the British army, and only later for the benefit the Indian population. Cholera, which is spread through the contamination of drinking water and food with sewage, was a serious disease in nineteenth-century India. More than 15 million people are estimated to have died from cholera in India between 1817 and 1865. British soldiers and their families regularly fell victim to cholera, which forced the government to take measures to control the disease. A Royal Commission was appointed in 1859 to investigate sanitation in the British Army in India, and among its recommendations was the obligation to improve the health of Indian subjects as well as British soldiers. In 1864, a sanitary commission was appointed for each Indian province with the primary aim of controlling cholera.

The benefits were seen primarily by the British soldiers, however. Their mortality fell steadily over the next 30 years, while Indian deaths from cholera remained high (more than 800,000 in 1900, for instance).

Several international organizations aided in the spread of public health practice and knowledge to Africa and Asia in the nineteenth and early twentieth centuries. The Pan-Arab Quarantine Board of Health, based in Egypt, was created in 1892 to develop methods to control plague and yellow fever. The Office International d'Hygiène Publique (OIHP), whose membership later included India and Pakistan, was established in 1907 and was primarily concerned with communicable diseases such as cholera, but the OIHP also concerned itself with sanitation and hygiene. The Health Organization of the League of Nations, formed after World War I, also helped to improve health in Asia. The organization set up a field office in Singapore to study infectious diseases in Asia and assisted China in developing its public health service.

The Sanitation Revolution and Public Health Movements in Europe and the Americas

The sanitation movement of the mid-nineteenth century in Europe and the United States had at its heart a profound tension between the classic nineteenth-century principle of personal liberty and the growing importance of collective health and citizenship. From the movement emerged a highly influential view of the proper relationship between medicine and the state, one mediated in Europe and the United States by the creation

and expansion of new public health agencies. This movement was part of a broader aspiration among the newly affluent middle classes—initially in Britain and later in Europe and the United States—to place their own standards of morality, civility, and hygiene at the heart of life in industrial societies. Sanitation reform was seen as necessary to improve not only health but also wealth, welfare, and morality.

In 1800, 80 percent of the British population lived in rural villages. By 1900, 80 percent lived in towns and cities. Industrialization and urbanization brought wealth for the middle and upper classes but also high levels of urban poverty, squalor, and disease. Epidemic diseases such as cholera, first seen in Britain in 1831, swept through overcrowded slums. Industrialization made the country as a whole rich, but the workforce was sick and getting poorer, at least in the short term.

A key question for nineteenth-century intellectuals was how to respond to the new industrial poverty. In the early 1800s, laissez-faire capitalism—the principle that trade and industry should be subject to as few regulations as possible—dominated British public life. One expression of laissez-faire capitalism was in the provision of fresh water and the disposal of sewage in the new industrial cities. Water was provided by private companies or from communal street pumps, and sewage was collected in cesspools or emptied into rivers, often the only source of drinking water. Through the lens of modern bacteriology, it seems obvious that this cycle of contamination was implicated in the transmission of disease. But to city dwellers, sewage disposal was only one aspect of urban life, all of which seemed dirty and diseased. Early sanitation reformers saw all aspects of the urban environment as causes of disease.

Many reform movements in this period were based on the Christian evangelical movements of the 1830s and 1840s. The sanitation movement possessed this element of morality: epidemics were seen not as God's punishment of sin but rather as a result of the human failure to look after His creation and His poor. This reflects a gradual movement away from laissez-faire ideology, as the middle classes began to take a paternalistic—some said patronizing—interest in the health and welfare of the poor.

Two strands characterized the sanitation movement. The public strand, led by middle-class physicians, politicians, and journalists, emphasized the material and collective aspects of sanitation: sewers, clean water, and so on. The private strand, associated with groups of middle-class women such as the Ladies Sanitary Association, took an interest in individual behavior and circumstances. These groups entered and inspected the homes of the poor and offered education in cleaning and cooking. These strands were complementary, and their interests often coalesced. In the 1830s, for example, both campaigned to provide public washhouses in which the poor could clean themselves and their clothes.

A leading figure in the public strand of the British sanitation movement was the lawyer and civil servant Edwin Chadwick. Chadwick had been a student of the English utilitarian philosopher Jeremy Bentham (1748–1832) and adopted the utilitarian principle of using government to produce “the greatest happiness of the greatest number.” From 1834 onward, Chadwick worked for the Poor Law Commission, a government organization investigating poverty. From 1837 the British government introduced official registration of births and deaths. Early records revealed a very high infant death rate in poor urban areas: 153 infant deaths per 1,000 live births, compared with fewer than 16 per 1,000 in the West today. This and Chadwick’s work for the commission convinced him that disease was associated with poverty.

In 1842 Chadwick published *Report on the Sanitary Condition of the Labouring Population of Great Britain*. His main conclusion was that rotting organic matter such as sewage and food waste released a malodorous and poisonous “miasma,” which was responsible for transmitting infectious epidemic diseases such as cholera. In his view, slums were not a danger just to their inhabitants: the miasma they generated could spread disease to a whole town. This miasmatic model of disease provided a rationale for Chadwick’s proposed program of “environmental” sanitation reform: improving water supplies, building sewers and drains, regulating refuse disposal, and controlling industrial pollution.

Though widely seen as a challenge to personal liberty, Chadwick’s program of reform

received governmental approval with the 1848 Public Health Act. The act established the General Board of Health to oversee public health and sanitation reform, with Chadwick as chairman and the London physician John Simon (1816–1904) as medical officer. Despite Chadwick’s pioneering work, the most radical sanitation reforms took place under Simon’s supervision after Chadwick had left the board. Simon favored a neocontagionist model of epidemic disease in which disease was spread from case to case by waterborne particles. This model provided an equally strong rationale for sanitation reform.

In 1858 the engineer Joseph Bazalgette (1819–1891) was commissioned to build a massive integrated sewer system for London. In the hot summer of that year, the level of the River Thames fell, and the smell of rotting sewage on its banks caused Parliament to be suspended for several weeks. Several years of these “great stinks” and a major cholera epidemic in 1866 brought home the need for further sanitation reform and the completion of Bazalgette’s scheme. The swift change in public attitudes toward sanitation reform is illustrated by the fact that the 1866 Sanitary Act, though far more interventionist than the Public Health Act, faced little opposition in Parliament and the press.

Both Europe and the United States experienced cholera epidemics in the first half of the nineteenth century, but only in the 1870s did the condition of their industrial cities begin to reach crisis point. Political instability, particularly the European revolutions of 1848 and the American Civil War, complicated sanitation reform. The emergence of bacteriology and new theories of disease transmission in France and Germany in the late nineteenth century added a scientific dimension to the activities of the sanitation movement in these countries. In Germany, sanitation reform became part of Otto von Bismarck’s (1815–1898) program of political unification, industrial modernization, and social welfare. In France meanwhile, two “great stinks” in Paris in the 1880s triggered a nationwide program of sewer construction and slum clearance, though such efforts raised concerns about aggravating underlying class tensions in French society.

Though Chadwick’s work had inspired some sanitation reformers in the United States in the

1840s and 1850s, the turmoil of the American Civil War hampered their efforts to establish a federal agency for sanitation reform. In the aftermath of the war, many cities and states established health boards, which oversaw food quality, water supplies, and the containment of epidemic disease. The National Board of Health, established in 1879, took responsibility for coordinating scientific research into contagious diseases and sanitation engineering at a national level. As the influence of the sanitation movement spread across Europe and the United States, the incidence of epidemic diseases declined sharply. Public health reformers began to shift their emphasis away from sanitation reform, embracing a wider concern for the social and medical problems associated with urban poverty.

Tuberculosis

Tuberculosis is a highly contagious infectious disease caused by the microorganism *Mycobacterium tuberculosis*, which most commonly infects the lungs but can also affect other parts of the body, including the central nervous system, lymphatic system, bones, and connective

tissue. Tuberculosis is primarily spread through the air—for instance, when an infected person coughs or sneezes and a susceptible person inhales the infectious aerosol droplets—but can also be contracted through infected milk and meat products. Because tuberculosis victims often become anemic and therefore pale due to blood loss and failure of the bone marrow cells to produce red blood cells, tuberculosis was sometimes known as the white plague. It is also known as consumption due to the wasting effects of the disease, which seemed to consume a person from within.

Despite the availability of effective treatments, tuberculosis remains a common disease today: it is estimated that one-third of the world's current population has latent tuberculosis, and tuberculosis is the second most common cause of death from infectious disease among adults worldwide.

Although tuberculosis is an ancient disease, it became particularly widespread in Europe and the United States in the eighteenth and nineteenth centuries, when the Industrial Revolution created ideal conditions for its spread. It is estimated that in the late nineteenth century, 10 percent of all deaths in the United States were due to tuberculosis, and in France it was the most common cause of death from infectious disease.

Although tuberculosis claimed victims from all social classes, it was deadlier among the poor, whose crowded living conditions encouraged contagion. For instance, in the 1840s in London, death rates from tuberculosis were four times higher in the poor parishes of Whitechapel and St. Giles Cripplegate than in wealthier Westminster. Further evidence of the relationship between tuberculosis and crowded, unsanitary living conditions was the high incidence of death from tuberculosis in prisons in the late nineteenth century. Tuberculosis was the assigned cause of death for three-quarters of the Massachusetts prison population between 1890 and 1895, and in Chatham Naval Prison in Great Britain, between 1870 and 1880 half the prisoners died each winter from the disease.

In the nineteenth and early twentieth centuries, the most common treatment for tuberculosis was confinement in a sanatorium, a special

➤ ROBERT KOCH

Robert Koch (1843–1910) was a German physician and microbiologist who was awarded the 1905 Nobel Prize in Physiology or Medicine for his discovery of *Mycobacterium tuberculosis*, the organism that causes tuberculosis. This discovery made possible the first modern efforts to prevent and control tuberculosis through sanitary measures. Previously, many had believed it to be a hereditary disease. Koch also discovered the anthrax bacillus (1877) and the cholera bacillus (1883).

Koch developed what are known today as Koch's Postulates, which state four criteria required for an organism to be considered the cause of a disease. The postulates are:

1. The organism must be found in all diseased animals and not in healthy animals.
2. It must be isolated and grown in a pure culture (in the lab).
3. When introduced into a healthy animal, the cultured organism should cause disease.

A physician and founder of bacteriology, Robert Koch was the first to prove that specific microorganisms caused specific diseases. A Nobel Prize winner, he is best known for having identified the bacteria that cause cholera and for his research into the cause of tuberculosis. (Library of Congress)

4. It must be possible to reisolate the organism from the newly infected animal.

Although Koch's Postulates are not considered entirely valid today, they represent an important stage in the development of scientific microbiology.

—Sarah Boslaugh

hospital or rest home. The first sanatorium in Europe was opened in the Bavarian Alps in 1854, and the first U.S. sanatorium was opened in Saranac Lake, New York, in 1886. By 1938, more than 700 sanatoriums had been built in the United States. It is debatable whether the typical sanatorium regime of exposure to fresh air, exercise, and a nutritious diet was helpful in curing tuberculosis. It may be that the chief benefit may have been the removal of infected people from society, thus lowering the risk of exposure for everyone else.

Tuberculosis was so common in Europe and the United States in the early industrial era that it was often portrayed in literature and art. For instance, the operatic characters Mimi in Puccini's *La Bohème* and Violetta in Verdi's *La Traviata* both die of the disease, Thomas Mann's novel *The Magic Mountain* is set largely in a sanatorium in the Swiss Alps, and the painter Edvard Munch often portrayed consumptives in his work. Because tuberculosis often infected all members of a family, it was once thought that it was hereditary. Such theories were abandoned, however, when the infectious nature of

tuberculosis was established after the German physician and scientist Robert Koch (1843–1910) successfully isolated *Mycobacterium tuberculosis* in 1882. His discoveries inspired the establishment of a number of national public health organizations focused on combating the disease. Such organizations were formed in France and Denmark in 1891, the United States in 1892, Germany in 1895, and Great Britain in 1897. Effective public health measures included public education in hygiene, improved housing, isolation of contagious individuals, and legal prohibitions of public spitting. However, tuberculosis remained a common disease in the United States until the development of antibiotics in the 1940s.

Two other scientific advances played major roles in the battle to control and prevent tuberculosis. The first was the discovery of X-rays by Wilhelm Conrad von Röntgen in 1895. This technology allowed accurate diagnosis and monitoring of tuberculosis. The second scientific advance, which once seemed to hold the promise of eradicating the disease entirely, was the discovery of streptomycin, the first effective medical treatment for tuberculosis, by Selman

Abraham Waksman (1888–1973) in 1946. Rather than being eradicated, however, tuberculosis has made a resurgence over the last few decades, and the emergence of drug-resistant strains in U.S. cities such as New York and Miami have focused renewed attention on this disease.

Foreign Diseases in Oceania

Several factors contributed to depopulation among indigenous societies throughout the Pacific during the eighteenth and nineteenth centuries. They included conflicts with Europeans, enslavement, and environmental and social changes, but the most important factor by far was the introduction of foreign diseases among people who lacked immunity. Oceania did not suffer regional pandemics because of the geographical isolation of the islands and their distance from larger germ reservoirs. Yet specific populations were disrupted and devastated by the introduction of foreign infectious diseases at rates similar to those experienced by Native Americans following the arrival of Europeans. While it is believed that a small range of infectious diseases existed among Pacific islanders before foreign pathogens were introduced, in most cases islander immune systems were unable to counter the onslaught of foreign pathogens. Furthermore, those areas of Oceania with the greatest degree of geographical isolation from other Pacific island communities, for example, Hawaii, Aotearoa, and Rapa Nui, had the least developed immunity and thus were most vulnerable to infections.

Ferdinand Magellan was the first European explorer to encounter Pacific islanders, when he arrived with his fleet at Guam in the Marianas in March 1521. Subsequently, the Spanish established regular trade routes across the Pacific, the most important of which was the route between Acapulco in Mexico and Manila in the Philippines. Not until the voyages of the British navigator Captain James Cook, however, did the Pacific begin to experience the full impact of contact with the world of Europe and America. In the wake of Cook's three voyages to the Pacific in the mid to late 1700s, a host of sealers, whalers, merchants, missionaries, and settlers followed. With every new visitor to island communities came the possibility of foreign disease introduction.

Micronesia, the western region of Oceania, consists of many small islands and atolls, including the Mariana, Marshall, and Caroline island groups. In the Marianas during the Spanish-Chamorro Wars (1670–1700), the indigenous Chamorro population dropped from 70,000 (as reported by Jesuit missionaries in 1668) to less than 4,000 in 1710 (according to Spanish accounts). While armed conflict accounts for many losses, most historians agree that Chamorro depopulation was due mainly to the introduction of foreign infections. In the eighteenth and nineteenth centuries as contacts with Europeans increased, several more epidemics struck the Chamorro population, including leprosy, an ongoing issue, smallpox (1849), measles (1861), whooping cough (1898), and influenza (1899). By the end of the 1800s the overall population of Guam began to increase, but now it was a mixture of Chamorro, Filipino, and Spanish ancestry.

Due to a lack of European interest and the islanders' reputations for violence, the other islands of Micronesia tended to have less outside contact until the mid-1800s, when trade with Westerners increased. Nonetheless, the inhabitants of these other Micronesian islands, with less foreign contact, were no more immune to foreign diseases than those of the Marianas. Southeast of Guam, Chuuk's population (as high as 35,000 in 1827) declined rapidly as a result of tuberculosis, measles, venereal diseases, and smallpox epidemics. Farther east on the island of Pohnpei, islanders suffered from diseases brought mainly

by explorers and whalers: dysentery (1843), influenza (1845), and smallpox (1853). It is suspected that venereal disease was introduced to the Marshall Islands as early as 1850 (causing infertility and population decline), and further depopulation resulted from epidemics of chicken pox (1887–1892), measles (1890, 1907), influenza (1899, 1902–1904), hepatitis (1900), whooping cough (1902), and typhoid (1905).

Melanesia, the southwestern region of the Pacific, contains the larger islands of Papua New Guinea, the Solomon Islands, Vanuatu, New Caledonia, and Fiji. They experienced population losses, but imported infectious disease was not the major cause. Because of their proximity to one another, Melanesians had more consistent contact within their island groups than did the islanders of Micronesia and Polynesia. As a result, their immune systems were not as susceptible when foreign pathogens were introduced. Also, European contact was limited until the nineteenth century because of the Melanesians' fierce reputation and, in a reversal of what happened elsewhere, the Europeans' fear of infection. There is evidence that malaria and perhaps even typhus were present in the Solomon Islands when the Spanish explorer Hernando Gallego arrived in 1568. Malaria was likely present in other parts of the region as well. Although Fiji experienced major epidemics in 1791–1792, 1802–1803, and 1875, reducing the population by a third (to approximately 100,000) by the end of the 1800s, elsewhere the loss of population resulted more from blackbirding (the enforced enslavement of native peoples) than disease. Except for those in Fiji, the region was spared major epidemics until the twentieth century, when their interaction with foreigners increased.

Polynesia, the central and southeast region of the Pacific, also includes a large number of islands, including Hawaii, Rapa Nui (Easter Island), Aotearoa (New Zealand), Samoa, Tonga, the Cook Islands, and Tahiti. Polynesia received much more attention than Micronesia and Melanesia from Euro-Americans from the eighteenth century onward. As explorers, merchants, whalers, missionaries, and settlers arrived in Oceania, the islands of Hawaii, Tahiti, the Marquesas, and Aotearoa experienced severe population losses from influenza, measles, and tuberculosis.

➤ RAPA NUI

The history of Rapa Nui, an island of 63 square miles (163 square kilometers) in eastern Oceania named Easter Island by the Dutch navigator Jacob Roggeveen in 1722, provides one of the most striking examples of the impact of foreign disease. The island was settled around 900 CE, and its population may have been as high as 7,000 to 9,000 by the 1600s. Theories about the reasons for Rapa Nui's population decline continue to be debated, but there is no doubt that depopulation accelerated after the arrival of Roggeveen and his crew. While anchored offshore for a week, some 150 men went ashore for one day and introduced venereal diseases to the islanders. Sporadic visits by other Europeans continued until the 1830s, when ships' captains became cautious of landing at Rapa Nui because of the prevalence of syphilis.

Then in 1862–1863, when the population was approximately 3,000, as many as 1,400 islanders were kidnapped by Peruvian and Spanish slavers. Ninety percent died from the harsh treatment of their masters and the unfamiliar environment. By August 1863, due largely to international protest, the surviving Rapa Nuians were to return to their home. Unfortunately, many had contracted smallpox and tuberculosis, and as a result only 15 returned to Rapa Nui. The resulting outbreak of smallpox killed an estimated 1,000 people. By 1877 the people of Rapa Nui numbered only 111. Leaders, elders, and those who were the keepers of island culture and traditions were gone, and much of the history of Rapa Nui had been lost.

—Kerri Inglis

These diseases seem to have had less impact on other populations of Polynesia, such as that of Tonga, that were less frequently visited by foreigners. However, throughout Polynesia, European and American explorers, whalers, traders, merchants, and migrants introduced venereal diseases that diminished islanders' ability to procreate. Syphilis and gonorrhea contributed to sterility and infant mortality, causing decline in indigenous populations. As new infectious diseases were introduced, island communities had little time to recover physically and demographically before another epidemic hit. Hawaii and Aotearoa present clear examples of this.

When Captain Cook and his crew arrived in the Hawaiian Islands in 1778, the island's population was approximately 400,000. Venereal diseases and tuberculosis were introduced with the first foreign contact. By the time Protestant missionaries established themselves in the 1820s, the Hawaiian population was down to 135,000. In the late 1840s Hawaii experienced epidemics of influenza, measles, whooping cough, and dysentery. In 1853 there was a smallpox epidemic, and from the mid-1860s to 1900 Hansen's disease (leprosy) caused the quarantine and deaths of approximately 5,000 people. The native Hawaiian population continued to decline, reaching a low of 39,000 in 1896.

In Aotearoa, foreign disease and conflict with Europeans reduced the Maori population by an estimated 10–50 percent during the nineteenth century. From the 1790s onward, venereal diseases, dysentery, influenza, whooping cough, measles, typhoid, and tuberculosis were all introduced. The geography of the islands and the wide distribution of the population helped limit the spread of infection, but communities that were in close proximity to one another were much more susceptible to infections and had difficulty recovering. Population estimates for the Maori prior to 1800 are difficult to

confirm, but in 1840 the indigenous population was estimated at 100,000. According to the 1896 census, the Maori had declined to 42,113.

By the early twentieth century, populations throughout Oceania had been devastated by foreign diseases, some suffering as much as 80–90 percent depopulation. Most island populations began to recover in the years from 1890 to 1920, largely as a result of intermarriage with new immigrant groups. While some efforts were made to combat these disease outbreaks, neither traditional healers nor practitioners of biomedicine had many answers during this era before the advent of antibiotics.

■ Introduction: World Population Patterns

In the early twenty-first century any person with access to the Internet can go online and consult any one of several world population clocks, which provide second-by-second estimates of the world's population. All of them utilize powerful computers and sophisticated statistical methodologies to analyze massive quantities of data from censuses, surveys, records of births and deaths, and various other government records. Nonetheless, their numbers are still estimates. The world population clock provided by the U.S. Census Bureau provides the following warning: "The populations displayed on the clock are not intended to imply that the population of the world is known to the last per-

son. Rather, the clock is our estimate of the world population size and an indication of how fast it is growing."

If present-day figures about world and regional populations are (very) educated guesses, calculating population figures for the distant past is even more difficult. Sir William Petty (1623–1687), an English economist, made a pioneering estimate of the world's population in a book he published in 1682 that mainly focused on the population of the city of London. With no actual population data to work with, his calculations were based on two educated guesses: the first about the actual size of the world's land areas (which was quite accurate) and the

second about these land areas' carrying capacities (which were severely underestimated). His resulting estimate of a world population of 320 million people is now thought to be slightly less than 50 percent of the actual number. Such an error brings into full relief the difficulties of estimating historical populations in the absence of statistical data.

The practice of conducting regular censuses, which seek to provide insight into the basic structure and trends of society by gathering information about all inhabitants of a region or political entity, goes back to the seventeenth century. It is thought that the first effort to collect such data took place in New France (Quebec), where 16 surveys were conducted of the colony's population between 1665 and 1754. Beginning in 1749 the Swedish government ordered pastors of the state-controlled Lutheran Church to submit parish lists, which were then used to calculate the population of the kingdom. In 1787 a similar system was instituted in Lutheran Denmark. Several Italian and German states also conducted censuses in the eighteenth century, but none was as important as the national census conducted by the United States in 1790 and every decade thereafter. Its purpose was both to gather information about the population and also to allocate seats in the House of Representatives. Britain inaugurated regular censuses in 1801, and in the course of the nineteenth century so too did several Latin American states and all European states, with Russia being the last to do so in 1897. Censuses also were instituted in New Zealand in 1864, Canada in 1871, India in 1871–1872, Egypt in 1897, and Australia in 1901. Japan, however, instituted its first census only in 1920, and for most of Asia, Latin America, and all of Africa except Egypt, censuses were not begun until after World War II.

As a result, historians' estimates of the world's population before the twentieth century rely heavily on information gleaned from tax registers, statistics on households, dwellings and hearths, and various other forms of socioeconomic and even literary information. Not surprisingly, these estimates show a fair amount of variation depending on the data and methodology utilized. In broad terms, however, estimates of world population between 1750 and 1914 are

all in agreement about two basic points: that the world's overall population and the percentage of people living in cities both markedly increased. It took the human species countless millennia to reach the world's population level of approximately 770 million people in 1750. Then in the next 150 years, a mere blink of time in history, the world's population more than doubled to reach approximately 1,650 million by 1900. The rate of growth was fastest in the Americas, which in 1700 made up less than 2 percent of the world's population but in 1900 made up just over 13 percent. It was slowest in Africa, whose population grew modestly, from approximately 107 million in 1700 to 133 million in 1900. In every part of the globe, cities increased in numbers and size. Between 1700 and 1900, the number of cities in the world with populations over 100,000 increased from 34 to 287, and the number of cities with populations over 500,000 increased from 5 to 43.

Aside from overall growth and urbanization, historical demographers have described another broad change in the world's population patterns between 1750 and 1914. This is the change in fertility and mortality patterns that takes place as societies undergo economic development from preindustrial to industrial economies. First proposed by the American economist Warren Thompson in the late 1920s, the demographic transition model suggests that agrarian societies are characterized by high rates of mortality and fertility and thus have slowly growing or stable populations. At the beginning stages of industrialization (stage two of the transition model) mortality rates begin to fall, but fertility rates remain the same, resulting in a younger population and rapid population growth. In stage three fertility rates begin to fall, resulting in a population with relatively small numbers of dependent children and nonworking older adults. With proportionately a large part of the population of working age, this is the stage in which substantial economic growth is likely to occur. Finally, in stage four, mature industrial societies have low birthrates and mortality rates, resulting in large but stable populations.

The demographic transition model is not without its critics, who have argued that it applies to Europe but somewhat less well to the

United States and much of the developing world. Less debatable is the significance of the demographic realities that the model seeks to clarify and understand. Population growth and the changing structure of populations were simultaneously causes and indicators of the broad transformations in human societies that occurred between 1750 and 1914.

—James H. Overfield

Population Patterns in Asia

Population counts and estimates for Asia between 1750 and 1914 must be used with great care. Surviving records often focus on selected groups and regions such as genealogies of the Manchu ruling class in China or population registers known as *shumon aratame cho* from selected villages in Japan. House counts, tax data, and reports of government officials also can be used as indicators of population trends, but do not establish population patterns for the entire region. Registers of births and deaths become more available only in the closing decades of the period. Prime examples are parish registers in the Philippines; colonial population censuses in parts of British India, Sri Lanka, and Dutch Indonesia; and national registers in Meiji Japan.

Between 1875 and 1901, a series of famines struck various provinces in India, resulting in the deaths of over nineteen million people. This photograph taken in Madras, India, about 1876, shows a few of the many victims of famine during this period. (Sean Sexton Collection/Corbis)

Despite such deficiencies in the data, it is clear that population growth occurred across the region between 1750 and 1914. China's population doubled from approximately 150 million people in 1700 to 300 million in 1800 and reached 430 million by the mid-nineteenth century. Increased agricultural productivity during the Qing era (1644–1911) raised standards of living and stimulated population growth. By the nineteenth century new crops such as sweet potatoes, maize, and peanuts were cultivated in less arable lands, thus adding to food production. Rice production also increased with the intensification of irrigation and paddy and terrace farming. Political and natural calamities, however, did cause temporary increases in mortality. The casualties and dislocation wrought by the Taiping Rebellion (1850–1864) took the lives of as many as 25 million people. In massive famines in northern China in 1876–1877, the death toll was between 9 million and 13.5 million. Female infanticide also limited growth. Sample data on farmers born between 1774 and 1873 indicate that from one-fifth to one-quarter of baby girls fell victim to infanticide.

Following a period of rapid growth, when the population rose from an estimated 10 million in 1600 to 25 million in 1720, Japan's total population remained around 26 million to 27 million through the mid-nineteenth century. Domestic peace during the Tokugawa era (1603–1868) fostered agricultural growth from the expansion of cultivated lands and the spread of labor-intensive farming methods. Consequently, workloads for men and women in farming villages increased and likely had adverse effects on marital fertility and infant and maternal mortality. Late marriage upon obtaining economic resources to support families also slowed the rate of natural increase among the most fertile group of the population. For instance, women's mean age at marriage was above 20 in the 1600s and 1700s, whereas the Chinese equivalent was 16.1 to 16.8 from 1650 to 1850. Abortion and infanticide also suppressed the birthrate. Surviving village data indicate declining birthrates from 5.5 children for female cohorts born before 1700 to 3.2 children for those born between 1750 and 1800. Moreover, extensive famines, namely the Tenmei (1782–1787) and Tempo (1833–1837)

famines, caused a short-term population decline. The late nineteenth century saw a decline in famine intensity, as the Meiji government (1868–1912) modernized infrastructure and implemented relief policies. Food production kept pace with Japan's population that reached over 50 million by 1914.

Aggregates of indirect estimates suggest that the population of the Indian subcontinent increased from about 161 million in 1800 to over 283 million by 1901. In the eastern region of Bengal, for instance, increases in sales of salt, tax collections, and house counts indicate that the population grew from around 30 million in 1790 to 65 million in 1860. Meanwhile, periodic famines and epidemics attenuated growth. The famine of 1770 in Bengal killed approximately one-third of its population, whereas cycles of famine in the 1890s accounted for the loss of over 40 percent of the population in the north-western region of Rajputana. In Punjab in the far northwest, mortality rose sharply following the famine years of 1898 to 1899 due to the malaria, cholera, and plague epidemics that ravaged the region. During the peak year of 1902, the epidemics resulted in the deaths of 10 percent of the registered population. Female infanticide and Hindu prohibition of widow remarriage also moderated the population growth. As in Japan, famine mortality began to decline in the late nineteenth century. Relief policies, such as the Famine Codes in the 1870s, and improved communications, notably the expansion of railway transport, enabled the British colonial government to distribute food aid more efficiently.

Crude estimates of Southeast Asian population show a considerable increase from 35 million in 1800 to 86 million in 1900. Peace and stability and the effective end of periodic wars after the 1750s offer one explanation for the growth. Warfare in traditional Southeast Asia had often disrupted marriage, as it was intended to capture manpower, a valued resource in the thinly populated region. The formation of powerful centralizing states in modern-day Vietnam, Thailand, and Burma brought stability to family relations and was likely to have increased marital fertility. Commercial growth under colonial rule in the nineteenth century also spurred

demographic expansion. For instance, as the Dutch consolidated the Indonesian archipelago, they expanded tropical agriculture and encouraged labor-intensive wet rice cultivation to produce excess rice for export. Farming households met the growing labor demand by increasing the number of children as a future workforce. Thus, farming villages became more densely populated.

Siberia, or Russia's Asian periphery bordering the Ural Mountains in the west, the Arctic Ocean in the north, the Pacific Ocean in the east, and the Mongolian steppes in the south, experienced a staggering demographic growth from 1750 to 1914. The total population of Siberia increased from about 1.2 million in the late eighteenth century to 5.7 million a century later, and that of the far eastern region jumped from around 70,000 in 1860 to 855,000 in 1911. Migration of settlers into Siberia throughout the period was a primary factor for the rapid growth. Upon consolidating territories in the region in search of furs and precious metals, imperial Russia sponsored mass colonization of Russian settlers to cultivate barren lands and develop the economy in the thinly inhabited frontiers with predominantly non-Russian populations. In the nineteenth century, around 10 million farmers, largely from central Russia, settled in Siberia. While Slavic peoples accounted for 66 percent of the population in the far eastern region in 1897, East Asian and European minorities also moved to Russian Asia for commercial opportunities.

Overall, greater food production, economic expansion, and political stability contributed to the regional population growth during 1750–1914. Famines, warfare, and selective infanticide commonly raised mortality rates and suppressed population growth. Abortion and marriage restrictions were also at work in keeping fertility levels in check.

Population Patterns in Africa

Between 1750 and 1914, disruptions accompanying the slave trade and colonialism limited African population growth. African population increased by only 60 percent (from approximately 65 million to approximately 110 million), while at the same time world population nearly tripled. The impact of the slave trade was uneven but led to significant population decline in the areas most involved. Abolition of the trade allowed an increase in the population growth rate in some areas in the decades between 1850 and 1880, but the rate again declined as Europeans imposed their rule over most of the continent. As the worst excesses of colonial conquest ended, the population growth rate once again began to rise.

In western and central Africa, the region most affected by the Atlantic slave trade, the period 1650–1850 brought significant population decline, particularly in the coastal areas of the Bight of Benin, the Bight of Biafra, and the Congo-Angola regions. The Atlantic trade

reached a peak in the late eighteenth and early nineteenth centuries, with roughly half of the total number of Africans enslaved taken after 1770.

Population patterns and gender ratios also were affected. The wars accompanying the slave trade caused dislocation as people moved away from border areas or sought safety in remote and inaccessible places. Since roughly 60 percent of the slaves sent across the Atlantic were men, the gender balance in these areas became skewed. More women found themselves held in slavery in Africa, and polygamy may have increased. Some of the population loss was probably offset by the introduction of new crops, especially cassava and maize, but the introduction of these crops also led to women performing more of the agricultural labor.

Despite its official abolition in the early to mid-1800s, the Atlantic slave trade continued in western and central Africa until the late nineteenth century. During the nineteenth century the Congo-Angola coastal area between Cabinda and Luanda and its hinterland, with a population of around 4 million people, lost about 1 million people to the slave trade. After 1850 the Atlantic trade dwindled, but the trans-Saharan and Indian Ocean trades continued and even expanded throughout most of the nineteenth century. Between 1800 and the 1880s an estimated 1.2 million slaves were sold into the trans-Saharan trade, and an additional 800,000 were sold into the Indian Ocean trade. As a result, during the second half of the nineteenth century population on the eastern coast of Africa declined, and that of the savanna regions and the Horn stagnated or declined. The gender balance in these areas tilted toward males, as the majority of slaves taken in this trade were female.

European conquest often brought disease, famine, and ecological disaster in its wake. While not new to Africa, smallpox, typhoid, cholera, and measles accompanied the Europeans' arrival, sickened people weakened by hunger, and expanded to new areas on river steamboats. Beginning in 1899 as labor recruitment and tax collection brought people into closer contact with tsetse flies, sleeping sickness spread from the mouth of the Congo River to the eastern shores of Lake Victoria, killing up to 80 percent of the population in some areas.

An eighteenth-century engraving of a slave compound maintained by traders from four European countries on the Gulf of Guinea in present-day Nigeria. The transatlantic slave trade accounted for the forced migration of approximately six million Africans in the eighteenth century alone. (Library of Congress)

► PROBLEMS IN ESTIMATING AFRICA'S HISTORICAL POPULATIONS

In the absence of censuses, demographers and historians of Africa have used combinations of fragmentary evidence to reconstruct historical population trends. These include retrospective estimates from recent populations, studies of contemporary fertility and mortality patterns, changing slave prices, and educated assumptions. The relevant factors are disparate and sometimes contradictory. Possible losses from slave wars were no doubt offset by increases in population from new food crops, but to what extent? Inevitably, historians' estimates differ. For example, Philip S. Curtin has fixed the number of people taken

from Africa in the Atlantic trade at around 12 million; J. E. Inikori has estimated that the number was closer to 16 million, asserting that the West African population declined significantly during the period. Others have argued that during the years of the slave trade, the African population remained stable because the loss of people was offset by polygamy and new food crops. The final estimates are more than simply numbers. At issue is the question of the overall impact of the slave trade on Africa, not only from the fifteenth through the nineteenth centuries but even today.

—Barbara Traver

In the 1890s the widespread outbreak of rinderpest, an extremely lethal infectious viral disease affecting cattle and some species of wildlife, was introduced into Africa by infected cattle sent to feed Italian troops invading Eritrea. The disease devastated herds from the Red Sea westward across the Sudanic region to the Atlantic Ocean and southward through the savanna to the Cape. Up to 90 percent of domestic cattle died in affected areas. While earlier rotational agriculture had protected the soil, the growing of cash crops on large-scale plantations led to loss of soil fertility, reducing the foods available to support population growth. Brutality and punitive expeditions also killed many Africans. In the Congo Free State, for example, forced rubber collecting caused the abandonment of food crops, which led to starvation and flight. As a result, an estimated 5 million to 8 million people perished.

European demand for African labor and the growth of cities led to internal migration. The use of forced labor for portage often moved men long distances from their homes. Elsewhere, many men were encouraged to leave the countryside to seek employment on plantations and in mines, leaving women to maintain the farms. Ancient cities such as Begho, in present-day Ghana, declined, while newer ones, especially European administrative centers, grew in population. Population pressure led to mass migrations such as the Nguni movement (*mfecane*)

that shook southern and eastern Africa, depopulating some areas, moving peoples around the region, and creating new polities and ethnic groups.

A few factors contributed to limited demographic expansion at the end of the period. Increase during the nineteenth century in the population of three immigrant groups—liberated slave communities, Europeans, and Asians—would affect racial and political conflicts in the twentieth century. After the early colonial period modest stability, expanded transportation, and some improvements in health care allowed faster population growth.

Population Patterns in North America

From the 1750s to 1914 the United States and Canada experienced a general population increase due to a high natural growth rate, transoceanic immigration, and the continuation of the slave trade even though it was outlawed by the United States and Great Britain in the early 1800s. As a result, the U.S. population increased from 4 million to 76 million from 1790 to 1900, while Canada's population expanded from 75,000 in 1761 to 5 million by 1901. Moreover, both Canada and the United States experienced significant internal migration. In both, populations expanded westward throughout the nineteenth century and became more urbanized.

From the mid-1700s to the early 1900s, the United States and Canada experienced steady population growth. Population growth in this period was a worldwide phenomenon, resulting mainly from increased agricultural productivity but also from improved medical care, the increased availability of fresh water, and improved sanitation. In the United States the population doubled every 23 years from 1776 to 1860. During these years, the African American population, although growing, declined in relative terms, from 19 percent to 11.6 percent of the population between 1790 and 1900. The U.S. population grew at a rate of 3 percent per annum from the later 1700s to the time of the Civil War, with immigration constituting a quarter of the total 3 percent growth rate. During the same period African American growth rate was only 2.2 percent per annum. Canada in the late eighteenth century had an even higher growth rate than the United States, 3.9 percent annually. However, this rate declined in the course of the nineteenth century to 3.7 percent from 1811 to 1861 and then to only 1.3 percent from 1861 to

1901 due to emigration and falling birth rates. As a result, while Canada in the first half of this period had a population that was 10 percent the size of the United States, by 1900 this number dropped to only 7 percent. Despite declining growth rates in the late nineteenth century, populations in Canada and the United States still expanded more rapidly than in Western and Central Europe, where the growth rates were .4 percent and .7 percent, respectively.

While the U.S. and Canadian populations continued to grow in the second half of the nineteenth century, fertility rates declined. In the early 1800s the United States had one of the world's highest fertility rates, with an average of 7 children per woman. By 1860, however, the rate had already dropped to 5.2 children per woman, making it closer to that of Western Europe (England's rate was 4.9) and lower than that of Canada. By the 1870s the U.S. fertility rate was lower than any country in Western Europe other than France, at 4.5 children per woman. Canada's fertility rates also declined after 1861 in English-speaking areas (although they remained high in French-speaking communities).

Death rates, after rising sporadically up to the 1860s, fell in the late nineteenth century following the Civil War, when 600,000 Americans out of a population of 32 million were killed. Medical innovation played a significant factor in the subsequent fall in death rates. For example, after vaccinations replaced inoculations in the 1790s, smallpox in the United States declined as a serious public health concern. In the mid-nineteenth century, America's cities had a higher mortality rate than the countryside due to diseases such as typhus, tuberculosis, and cholera, whose spread was encouraged by unsanitary living conditions and overcrowding. Overall mortality rates declined in the post-Civil War years as the United States implemented sanitary reform. When cholera, for instance, again threatened the inhabitants of New York City in 1866, the death rate was minimized by applying Englishman John Snow's 1850 discovery that the disease was spread by water contaminated by feces.

The African slave trade and transoceanic immigration were also significant factors in the increasing population in North America from 1750 to 1914. From the sixteenth century to the

nineteenth century, approximately 10 million to 11 million enslaved Africans were brought to the Americas, with more than half of this forced migration between 1760 and 1860. While most of these Africans were brought to the Caribbean and Brazil, approximately 250,000 slaves were brought to the United States during the late eighteenth century before the slave trade was outlawed in 1808.

An even larger demographic shift occurred from 1820 to 1930 when 50 million Europeans left Europe in the largest transoceanic migration in world history. Thirty-one million of these immigrants traveled to the United States, while another 13 million traveled to other parts of the Americas. The first wave of immigration consisted mainly of northwestern Europeans who traveled to Canada or the United States. Canada's major period of immigration was 1826–1835, when it received 40 percent of all European immigrants traveling to the Americas. The second wave of immigration occurred between the 1880s and the 1930s. These immigrants, more likely to be Catholic or Jewish, came primarily from southern and eastern Europe. During the first decade of the twentieth century, on average almost 1 million immigrants arrived in the United States each year. The foreign-born population during this period reached 14.7 percent of the total population in 1910.

Significant emigration also occurred from Canada and Mexico to the United States. Half a million Canadians, out of a population of only 4.5 million, migrated to the United States in the final decades of the nineteenth century; they constituted 10 percent of U.S. immigrants from 1890 to 1914. Historians attribute this shift to a rising Canadian population without concurrent growth in industrialization, urbanization, or tillable land. As a result of Mexican immigration, in 1910 more than 200,000 Mexican nationals and 100,000 of their children lived in the United States.

The United States also experienced internal migration. In the late 1800s an ever-growing number of Americans moved west. In 1860, the Eastern Seaboard was the home of more than half of the U.S. population. However, by 1910 this number dropped to 41 percent. Western and Pacific states experienced the fastest growth, growing from 14 percent to 30 percent. In Canada,

➤ SHIFTS IN THE AMERICAS' INDIGENOUS POPULATION

In contrast to most other ethnic groups, America's indigenous population experienced a period of general decline from 1750 to 1900. Before 1492, the Americas were dominated by descendants of northeastern Eurasians who scholars believe migrated to the Americas from approximately 10,000 to 8,000 BCE. Isolated for nearly 10,000 years, the Americas' indigenous populations lacked immunities to many Eurasian and African diseases; therefore, Western diseases resulted in virgin soil epidemics, epidemics in which a new and deadly disease spreads to nearly all members of a population. Some isolated indigenous groups did not encounter European diseases until the nineteenth century. For instance, malaria was unknown to the Chinookans and Kalapuyans, two of the largest groups in northwestern Canada. In the 1820s, they had a combined population of 18,580. A decade later, malaria combined with other diseases reduced their population to 2,433. Their demographic decline suggests patterns of other Native American groups. While numbers are debated, it is estimated that in North America, Indian population numbers dropped from 1.9 million to 500,000 from 1500 to 1900. In the United States and Canada, the number of Native Americans continued to decline until 1900. (The 1870 census marks the lowest recorded Native American population in the United States, with just under 30,000.) This pattern, though, was reversed by the early twentieth century as their population began a period of growth.

—Kassi Klinefelter

the westernmost territories, present-day British Columbia, did not experience widespread settlement until the 1850s and 1860s after gold was discovered in the area and then the Hudson Bay Company's land was sold to the state, respectively. Only a small number of blacks moved west. Despite having received emancipation during the Civil War, they mainly remained in the South. In 1860, 93 percent of African Americans lived in slave states. Forty years later this number had dropped by only 2 percent.

Significant urbanization also occurred in Canada and the United States in the late nineteenth

and early twentieth centuries. In 1810 the United States had only 2 cities—New York and Philadelphia—with populations of more than 50,000; by 1860 the number rose to 16 cities. By 1920, the U.S. census for the first time recorded more residents living in cities than rural areas. U.S. urbanization was uneven. In 1920, 74 percent of urban residents lived in the Northeast or the Midwest, while only 17 percent resided in the South. Canada's urbanization, in contrast, began at the turn of the twentieth century. The largest period of urban growth occurred from 1900 to 1911, when Canada's urban population rose from 28.7 percent to 37.2 percent. In the early twentieth century, Canada's cities, while generally smaller than their American counterparts, grew nearly 200 percent. In both Canada and the United States, immigration and industrialization were the main causes of urbanization.

Population Patterns in Latin America

According to a United Nations estimate, the population of Latin America grew from 16 million in 1750 to 85 million in 1914. This more than fivefold increase occurred in two phases. The first phase saw relatively slow but steady growth for more than a century, in which the people of Latin America doubled in number (16 to 30 million); while the second phase witnessed the population almost tripling (30 to 85 million) in little more than sixty years.

In 1750, the Latin American population consisted of three racial groups and mixtures of the same: Indians, who were generally the conquered people and the lowest in the social and political hierarchy; African slaves, who worked as slaves on plantations, in the mines and as servants; and the whites, both those born in the Americas (creoles) and those born in Spain or

Portugal (*peninsulares*, or *gachupines*) who occupied the highest rung of the social and political order.

The Indians of the Americas, who (except for the Inuit) had been the sole occupants of the American continent and may have numbered about 50 million on the eve of their conquest by Europeans, suffered a demographic disaster in the sixteenth and seventeenth centuries. Largely as a result of disease, the Indian population of the Americas declined in the sixteenth and seventeenth centuries to perhaps five million; by the eighteenth century this demographic hemorrhage had stopped and the indigenous population began a very slow rebound.

The European conquerors made up for the loss of Indian labor by importing African slaves, and by 1750 there may have been three and a half million of them in the Americas. The Spanish and Portuguese in Latin America probably numbered four million in 1750. About four and a half million Latin Americans were *mestizos*, descendants of Indian mothers and European fathers. The remaining half a million were *mulattos*, mixed offspring of African and European couplings. The mestizos were the fastest growing element of the Latin American population until the latter half of the nineteenth century.

By the 1780s, increased European demand for tropical products, particularly sugar, chocolate, coffee, and cotton, stimulated increased settlement in Brazil, the Caribbean coast of Venezuela and Columbia, and Cuba. This led to a moderate increase in immigration from Spain, particularly Andalusia and the Basque Provinces as well as the start of larger imports of African slaves to work on the new plantations. Additionally, stepped-up European demand for hides and leather, as well as for jerked beef to feed the increased number of plantation slaves who grew the tropical goods, prompted European and mestizo frontiersmen to move out on the Argentine pampas and the Venezuelan llanos to hunt the wild cattle that roamed these grasslands.

The wars for independence had a negative impact on the moderate population growth that Latin America was experiencing, but except in Uruguay and Hispaniola, the slowing effect of these wars on population increase was quickly repaired. More serious were the consequences

of disease epidemics that increased mortality as the port cities grew in commercial activity, population, and squalor. Improvements in city water supplies, sanitation and sewerage systems brought most of the epidemics under control, but not until the early twentieth century.

In the latter half of the nineteenth century, the great European and North American economic expansion fueled a growing demand for Latin American exports, especially coffee, meat, sugar, bananas, minerals and rubber, but much of Latin America was too sparsely populated to take full advantage of this burgeoning demand. In the first half of the century, the increased demand for labor to produce sugar and coffee stimulated a spike in the African slave trade, especially to Brazil and Cuba, but after 1850, British naval and diplomatic efforts ended that source of laborers. The alternative labor supply was European and, to a much lesser extent, Asian. Latin American leaders had a racial preference for European immigration; they saw this not only as the solution to their labor shortage but also as a way to “whiten” populations in which “backward” darker racial strains were so prominent. Under the slogan “To govern is to populate,” most Latin American governments in the last half of the nineteenth and the first decades of the twentieth century launched programs to encourage immigration from Europe.

There had been a very moderate flow of immigration from Europe throughout the period. Before independence, most of the European immigration to Brazil had, by government fiat, been Portuguese, while Spanish law restricted immigration to Spanish colonies to Spaniards. After achieving independence, the new states threw the gates open to all Europeans, but hoped to attract northern Europeans especially.

However, it was not until the latter part of the nineteenth century that massive immigration from Europe began. Large numbers of Italians, Spaniards, Portuguese, and Germans migrated to southern Brazil, Argentina, and Uruguay in the late nineteenth and early twentieth centuries. People from England, France, and Ireland found homes in Argentina and Chile, and many Spaniards migrated to Cuba before and after the Spanish American War (1898). Lebanese

➤ TRANS OCEANIC SWALLOWS

In the 1890s, the cost of a transatlantic crossing was reduced to about \$10 for steerage, enabling agricultural migrant workers to take passage on steamships from northern Italy to Argentina. The migrants could work during the harvest season in the southern hemisphere’s summer and fall. In the southern winter, these migrants would return to Italy, to harvest the grapes and olives in the Mediterranean harvest time. These annual sojourners were known as *golandrinos* (swallows) because they returned to Italy at the time the swallows returned from their winter migration to Africa.

—Wilfred J. Bisson

and Poles added to the ethnic diversity of most Latin American capitals.

The largest number of immigrants to Brazil, Argentina, and Uruguay were from Northern Italy. More Argentines claim Italian ancestry than claim Spanish roots. The Italians who migrated to Argentina and southern Brazil were expected to become tenant farmers on large estates, but after a few years in the new lands, many migrated to the growing cities. The focus for immigrants to Argentina was Buenos Aires, which in the early years of the twentieth century became the first Latin American city to have a population of a million. Rio de Janeiro was the next to achieve that distinction a few years later. São Paulo, today the largest metropolis in South America, was also an early magnet for Italian as well as Portuguese immigrants. With the abolition of slavery, these immigrants were expected to provide cheap labor for the coffee *fazenda* (coffee plantations). In some places coffee fazendas were divided into plots that were rented on a share-crop basis to immigrants. It was expected that one immigrant family could care for and harvest 1,000 coffee trees. But this arrangement was not sufficient to hold immigrants on the land after they had paid off the money the employer had advanced for their ocean passage. Many found opportunities in booming São Paulo and other cities.

Latin America’s population was further diversified by immigration from Asia. As early as the 1860s, Chinese indentured workers began to be

imported into Peru to work the guano fields on the islands off the coast and to extract nitrates from mines in what became Northern Chile after the War of the Pacific. Chinese indentured workers were also brought to Cuba to cut sugar cane. (Fulgencio Baptista, president-dictator of Cuba from 1933 to 1959 who was overthrown by Fidel Castro, was descended from one of these Chinese immigrants, while Castro's father was an immigrant from Spain.)

Japanese immigrants also began arriving in Latin America in the early twentieth century. Most of these were brought in to work on the coffee fazendas, but most quickly found niches in the diversified economy of São Paulo. Today, about a million and a half Brazilians claim Japanese ancestry, as do nearly 100,000 Peruvians.

On the eve of World War I, Latin America was still a very lightly populated region, though it was more than five times as populous as it had been in 1750. In 1750, the region of southern South America was a backwater, but by 1914 it had become the most dynamic part of Latin America. During the 164 years since 1750, Latin America's population had become more "Europeanized." One question that historians have been unable to answer is, what happened to the many Afro-Argentines who lived in the La Plata region in the eighteenth century? Did they not leave descendants? Did their descendants meld into the mass of Argentine population, without leaving a trace?

Population Patterns in Oceania

Following European contact, a series of cultural and demographic changes occurred throughout Oceania. These transformations included the exchange of material goods, cultural symbols, and genetic material; dramatic reduction in native populations because of introduced diseases; the arrival of settlers from Europe and East Asia; and the imposition of European colonial rule. Yet indigenous peoples and cultures persisted through all of these transitions and continued to survive through the twentieth century.

By 1750, European explorers had charted many of the major island groups in the Pacific Ocean. The last major island chain to be discovered by European people was Hawaii, which was sighted in January 1778 by the crew on Captain James Cook's third voyage of discovery. Hawaiians were among the last Polynesians to make contact with Europeans. Other groups in highland New Guinea and Western Australia did not make contact with Europeans until the twentieth century. Contact with Europeans resulted in trade, conflict, and occasionally settlement. The earliest European settlers in Oceania, often referred to as beachcombers, were European men who "went native," adapting to the local culture and marrying women from the islands where they stayed, sometimes raising large families.

Epidemics caused by microbes such as smallpox and influenza had a dramatic impact in Oceania, causing large numbers of islanders, who had no natural immunity, to die. At the same time, sexually transmitted diseases were often spread through the widespread practice of exchanging sexual favors for trade goods. Syphilis was particularly problematic, as it reduced the birthrate among Oceanic populations. These diseases often resulted in the deaths of the majority of the native population of a given island over a span of a century or less. In the late nineteenth and early twentieth centuries, Hansen's disease (leprosy), feared throughout the world, was introduced into Oceania. Because of these diseases, Oceanic populations had often been dramatically reduced by the time Europeans

began exploiting and colonizing them more systematically.

Whaling and trade played a major role in the dispersion of different groups of people throughout Oceania. Native people were often recruited onto whaling ships that would take them on a yearly circuit, following pods of whales around the Pacific Ocean. Whaling companies encouraged sailors to rely on credit, keeping the sailors in debt and thus forcing many to a life at sea. Port towns such as Honolulu and Levuka, Fiji, developed and prospered as a result of whaling and trade networks and often served as the first foothold of colonial settlement in the islands. British settlement in Australia and French settlement in New Caledonia in the nineteenth century were initiated by the perceived need to transport and house prisoners in far-off lands. Penal colonies represented another kind of colonial foothold for European nations. Eventually, port towns and penal colonies would grow to become major colonial centers for European maritime powers.

When Europeans began establishing settlements in Oceania, they believed they were colonizing lands that were empty or full of savages who were destined to be assimilated or to simply die off. The imposition of European-style settlement patterns, religion, and ideology often resulted in conflict with native people. The British were particularly enthusiastic in their colonization of New Zealand and Australia, in which thousands of settlers, along with imported flora and fauna (particularly sheep), were introduced. Because of colonial pressures, the Maori fought a number of wars with British settlers in New Zealand in the mid-nineteenth century. Alongside the British and French, Germany began to assert its presence in the Pacific by the late nineteenth century, establishing colonies in Micronesia and engaging in diplomatic conflict with the Americans and British over colonial rights to Samoa. The United States, itself a settler society, would make an important entrance into Oceania by annexing the Hawaiian Islands in 1900.

Imperial claims to islands in Oceania were accompanied by an influx of European settlers. These settlers often formed a wealthy minority.

➤ HANSEN'S DISEASE IN THE PACIFIC

Hansen's disease, more commonly referred to as leprosy, is one of history's most feared and misunderstood illnesses. Its appearance in Oceania resulted in the establishment of isolated settlements, such as Kalaupapa, Hawaii; Quail Island, New Zealand; and Makogai, Fiji. Thousands of people were forcibly removed from their homes and families and were imprisoned in these quarantine stations. In Hawaii, the disease was given many names, but perhaps the most telling one is *ma'i ho'oka'awale 'ohana* (the disease that tears families apart). Compared to smallpox or influenza, Hansen's disease caused a small number of deaths, but the legacy of forced removal and exile has left an important mark on history in Oceania.

—James L. Flexner

In contrast, thousands of migrant laborers moved throughout Oceania in the nineteenth and twentieth centuries. Many came from China or Japan and worked throughout Oceania, from the sugar plantations of Hawaii to the goldfields of New Zealand and Australia. Most of the laborers were men, and many remained on those islands and established families, sometimes marrying native women.

By the beginning of World War I, the populations in Oceania had changed drastically. What had been a region dominated by native people and cultures, with the occasional beachcomber, was transformed into a region of empires in which no island existed without some kind of European claim to dominance, whether real or imagined. At the same time, many Oceanic people, from Australian Aboriginals to native Hawaiians, continued their traditional lifeways while adapting to developments in the modern world. Much of twentieth-century history in the Pacific is marked as much by the resilience and continuity of native cultures as by the transformations outlined above.

Thinking about Population—Malthus

Thomas Robert Malthus (1766–1834) is well known for many things but is remembered mainly for his views of population growth and its dangers. He was a Cambridge graduate and an Anglican curate and professor. Each of these positions molded, shaped, and influenced Malthus's writings.

Malthus's most famous book, *An Essay on the Principle of Population*, went through six editions between 1798 and 1826. Each new version added data, answered criticisms, and presented more detailed discussion of the author's views on the topic of population. The essay was

➤ MALTHUS'S DIFFERING OPINIONS ON THE CORN LAWS

Malthus's ideas influenced pieces of legislation other than the 1834 Poor Law. The Corn Laws, which created import tariffs on foreign grain between 1815 and 1846, were a way of protecting the price of British corn by placing tariffs on grain imports. During the debate on the Corn Laws, Malthus wrote two distinct and opposing pamphlets. In 1814 in his first pamphlet, he supported the idea of free trade and opposed the proposed Corn Law legislation. By 1815, however, he had changed his position. Given the uncertainties of the post-Napoleonic world, Malthus argued that the United Kingdom should not depend on foreign imports. Malthus, in this way, became an opponent of the increasingly popular idea of free trade.

—Glenn Duerr

a response mainly to the arguments of William Godwin (1756–1836), the English journalist and political philosopher, and the French writer the Marquis de Condorcet (1743–1794), both of whom were strong believers in human progress and the ultimate perfectibility of society. Countering their arguments that population growth was a sign of economic health and the general progress of society, Malthus viewed population growth as leading to inevitable catastrophe.

Malthus's basic argument was that population growth will always have a tendency to outstrip the resources, especially the food resources, needed for existence. Such a catastrophe occurs because population increases geometrically (for example, 2, 4, 8, 16, etc.), whereas food production increases arithmetically (for example, 1, 2, 3, 4, etc.). Population increases geometrically because it is compounded with the birth of each new human being.

Population increases can be held in check by positive checks, such as famine, disease, and war that raise the death rate, and preventive checks, which lower the birth rates. The main preventive check was moral restraint, by which he meant delaying marriage and practicing sexual abstinence until that time. His advocacy of moral restraint was directed mainly toward the poor, who were both the main reason for population growth and its primary victims. His emphasis on moral restraint derives in part from his training as an Anglican curate and Christian teachings on the dangers of sexual promiscuity. Malthus's concerns also led him to question the benefits of public charity for the poor. Such charity encouraged further population growth and undermined the character and morality of the poor.

Malthus's writings were both influential and controversial. William Pitt the Younger, prime minister from 1783 to 1801 and 1804 to 1806, and the British Whig politicians who wrote the Poor Law Amendment Act of 1834 were both influenced by Malthus's thinking about the effects of charity. Others criticized Malthus for what they perceived as his callousness toward the poor and his excessive pessimism about the human ability to increase agricultural production. Malthus's arguments about how overpopulation leads to inevitable competition for limited

resources contributed to Charles Darwin's ideas of the struggle for existence and natural selection. Beginning in the 1960s, Paul Ehrlich, the author of *The Population Bomb* (1968), and many others who were concerned with the dangers of overpopulation echoed many of Malthus's ideas and came to be known as Neo-Malthusians.

Race Suicide

Race suicide refers to late-nineteenth- and early-twentieth-century fears in the United States about decreasing birthrates of white native-born citizens and a corresponding increase in fertility among immigrant and nonwhite racial groups. Historians agree that such a decline was occurring and attribute it to an increase in marital fertility control through child spacing, contraceptive use, and abortion. In Herbert Klein's study of the population history of the United States, he notes that fertility rates among white women in the United States dropped from approximately seven births per woman in 1800 to roughly three and a half in 1900. Conversely, from 1850 to 1930, the foreign-born population of the United States increased from 2.2 million to 14.2 million. Concern over race suicide was especially prominent in northern cities most affected by immigration and the northern migration of African Americans from the South. For example, in 1890 four-fifths of the New York City population was foreign-born or first-generation Americans. Native-born white Americans feared that when combined with the influx of immigrants from southern and eastern Europe in the late 1800s and their higher birthrates, democracy and American culture were threatened.

Decreasing birthrates during the late 1800s were also documented in European countries. France, in particular, had the lowest rate of fertility among European nations during the nineteenth century. In England, the downturn in fertility in the late nineteenth century raised concerns about the nation's ability to maintain its empire. While declining birthrates in Europe and the United States were of national concern, their conceptualization as a race suicide was specific to the United States.

The term "race suicide" was coined by the American sociologist Edward Alsworth Ross in his 1901 article "The Causes of Racial Superiority." Ross, like other nativists, believed that the characteristics of native-born white Americans—foresight, industriousness, and self-reliance—made them the superior race. However, Ross feared that these same characteristics led native-born whites to have fewer offspring so they could provide them a higher standard of living. Ross thought that superior white Americans were committing race suicide by failing to match or exceed the birthrates of immigrants and nonwhites.

U.S. president Theodore Roosevelt shared Ross's alarm about the falling birthrates of native-born white Americans. In 1903 Roosevelt drew public attention to race and birthrates when he publicly expressed his fears about race suicide. Roosevelt chastised feminists and "self-indulgent" men and women for their desire for smaller families. He exhorted white men and women to have large families as part of their patriotic duty to the nation and to civilization. During Roosevelt's presidency, Americans sent photos and letters about their large families to the White House and received presidential letters of congratulations in return. However, some Americans rejected the notion that the country was suffering from a race suicide. Feminists, such as Reverend Anna Howard Shaw, responded to Roosevelt's critiques, pointing out the hypocrisy of focusing on a potential race suicide while many living children were already suffering from poverty, child labor, and lack of medical care.

The concept of race suicide developed within the larger context of eugenics and scientific racism during the late nineteenth and early twentieth centuries. Eugenicists such as Frances Galton and Charles Davenport held the

➤ BETTER BABY CONTESTS

Concerns in the United States about race led to a host of race betterment projects, including Better Baby Contests. These contests began in the early twentieth century as a way to reward parents for children who reached certain standards of racial, aesthetic, physical, and developmental perfection. After noticing the ways that livestock competitions bettered farm animals, Mary T. Watts and Margaret Clark, club women and rural reformers from Iowa, concluded that this same model could be used to improve human beings. Thus began the first Better Baby Contest as part of the Iowa State Fair in 1911.

Better Baby Contests were open to the public and consisted of physician-judges using standardized scorecards to evaluate infants. The contestants were divided into groups based on age (12–24 months or 24–36 months) and then underwent tests for physical, aesthetic, and psychological fitness. The scorecard measured weight, height, and cranial circumference as well as eye and nose shape, facial expressions, attention, and energy. Winning babies were awarded cash prizes and medals and often were featured in local

newspapers. All the parents who entered their babies in contests received a scorecard containing notes from the physicians about how to improve their child's condition. Thus, Better Baby Contests were a way for parents to gain access to medical evaluations for their children. By 1914 most states held Better Baby Contests, often as part of state fairs, and more than 100,000 babies had been examined.

While Better Baby Contests were at first well received, reservations about their competitive nature and skepticism about the quality of received medical advice for less-than-perfect infants generated criticism. Additionally, the contests were often open only to white babies, and the judging criteria reflected Eurocentric ideals of what qualified as perfection. By the 1930s, the Great Depression and centralized New Deal health policies led to the demise of Better Baby Contests. Overall, Better Baby Contests were one early-twentieth-century effort to stave off the threat of race suicide by encouraging the propagation of fit children.

—Lena McQuade

misguided belief that human stocks or races could be improved through regulating reproduction. Race suicide, with its emphasis on encouraging the “fit” to reproduce, was considered a form of positive eugenics as opposed to negative eugenic practices such as sterilization. Fears of race suicide were also based on false scientific theories of racial hierarchy such as those advocated by French diplomat Joseph Arthur de Gobineau. Following Gobineau's theory of the inborn inequality of all human races, many Americans believed that there was a hierarchy of races that placed whites and northern Europeans at the zenith of civilization, blacks and Africans at the bottom, and all other races in the middle. Proponents of these racist theories were concerned that increased reproduction among the less desirable would lead to the decline of American culture. Likewise, they were also worried that this decline would be hastened by a lack of reproduction—a race suicide—among economically sufficient native-born whites.

Despite turn-of-the-century policy makers' and politicians' concerns about race suicide, some current historical research suggests that these fears may have been misplaced. In their study of fertility rates among immigrant, second-generation, and native-born women of native parents, historical scholars Miriam King and Steven Ruggles found that second-generation women had the lowest fertility rates of any other group. Basing their study on U.S. Census data from 1900, they discovered that the overall fertility of immigrants and their children was markedly lower than that of native-born women of native parents. While there are questions about the reliability of census data from the turn of the century—it is possible that some women were not surveyed or that their responses to census officials might have been incorrectly counted—King and Ruggles' conclusions raise the possibility that fears about race suicide were perhaps unfounded. The controversy over race suicide was most likely a

response to changing social structures, particularly immigration, urbanization, and feminism, during the early 1900s.

Birthrate Reduction through Family Planning

During the eighteenth and nineteenth centuries, before the mass production of reliable contraceptives, people experimented with a remarkably creative array of tools, toys, and techniques to prevent conception. Until the twentieth century, however, the only clearly effective method of contraception was abstinence. Ultimately, developments in medical technology and improved education about the realities of conception and pregnancy resulted in a greater acceptance of family planning in the twentieth century.

In the eighteenth century, Europeans and Americans relied on several strategies, many of which were ineffective or highly unreliable, to forestall pregnancy. One such strategy was douching. After intercourse, women would rinse their vaginas with water or a combination of water and other substances, such as vinegar. Another common method was the rhythm method, a means of avoiding or assuring pregnancy by timing intercourse according to a woman's menstrual cycle. The withdrawal of the

penis before ejaculation was another strategy to avoid pregnancy. In addition to these methods, many people used mechanical contraceptives during intercourse, including a wide range of diaphragms, pessaries and condoms.

During this era, the contraceptive probably used most frequently in England was the condom. Although the purpose of the condom was primarily to prevent disease—that is, as a prophylactic—contemporaries recognized that the condom could also prevent impregnation. In reality, though, the condom was an unreliable tool for either purpose. Condoms were produced from a wide range of substances, including the large intestines of sundry farm animals, and the cost of the materials combined with the fact that manufacturers created them by hand made condoms expensive. Because of this cost, eighteenth-century men reused their condoms, and those who failed to clean their prophylactics after intercourse may have actually helped to spread disease.

British scholar Thomas Malthus's theory on population growth and the inevitability of poverty significantly influenced economic, political and scientific thought in the nineteenth century. (National Library of Medicine)

THE WOMAN REBEL

No historical figure is more strongly associated with birth control than the nurse, activist, and writer Margaret Sanger. Though her greatest claim of fame would come later, Sanger first promoted the idea of birth control in 1914, when she published issues of her magazine, *The Woman Rebel*. The magazine's first issue proclaimed that its aim was "to advocate the prevention of conception and to impart such knowledge in the columns of this paper." *The Woman Rebel* did so bluntly, in part by challenging long-held superstitions about sex used to deter and even scare people away from intercourse. She declared, for instance, that "Seldom does the girl practicing promiscuity become pregnant." Sanger repeatedly struck at these types of assumptions, which she dismissed as a "stupid fallacy." In another issue, she declared that marriage laws only served to "abrogate the freedom of woman by enforcing on her a continuous sexual slavery and a compulsory motherhood." This type of frank discussion aroused the fears of censors, and later that year Sanger was indicted for publishing articles deemed "obscene, lewd, lascivious, filthy, and of an indecent nature." After fleeing to Europe to avoid trial, Sanger returned in 1915, and in 1916 charges against her were dismissed.

—Joel Silverman

Attitudes toward family planning changed across Europe in the nineteenth century thanks in part to the English economist Thomas Malthus (1766–1834), who in 1798 wrote the influential pamphlet *An Essay on the Principle of Population As It Affects the Future Improvement of Society, with Remarks on the Speculations of Mr. Godwin, M. Condorcet, and Other Writers*. In his pamphlet, Malthus warned that the food supply would not keep up with the growth of the population, since population expanded geometrically and the food supply only expanded arithmetically. His solutions to this problem included controlling the growth of population through abstinence and marrying later in life. Although Malthus actually opposed the use of contraception—he was, after all, an

Anglican clergyman—proponents of family planning championed his theories about population control. Malthus argued against the conventional wisdom that larger populations led to more wealth. In his view an increase in population instead drained the resources of society. Societies that ignored the need to control their populations could face famine, disease, and war. In the 1800s, neo-Malthusians adopted part of Malthus's argument to suggest that birth control could assist societies in solving social problems such as poverty.

The neo-Malthusians' arguments were complemented by improvements in contraceptive technology. The introduction of mass production techniques for condoms in the nineteenth century decreased costs and made contraception more available to those who desired it. But social mores and religious doctrine reduced the potential market for such goods. Laws in England and America banned texts that discussed contraceptives as obscene, and in 1873, the U.S. Congress approved a law that essentially banned the dissemination of materials relating to contraception and abortion through the U.S. mail.

With the increasing presence of women in public roles and with changing attitudes toward sexuality, activists took up the cause of birth control in the early twentieth century. As modernist men and women openly discussed sex in urban cafes and in other public forums, they began to champion family planning as an individual liberty. Activists such as Margaret Sanger, who coined the phrase "birth control," realized that they might successfully challenge anticontraceptive laws by demonstrating that those laws conflicted with popular ideals about free speech.

Urbanization in India under Colonial Rule

Indian cities underwent many substantial changes between 1750 and 1914. Many existing cities such as Allahabad grew larger, while some such as Lahore shrank. Several cities such as Bombay (present-day Mumbai), Calcutta (Kolkata), Madras (Chennai), and New Delhi, all created to serve as administrative and commercial centers, were new. The nature of cities also changed during this period. Some cities such as Bombay and Calcutta, for example, saw the emergence of an urban working class as a result of industrialization. Others took on a new European appearance as a result of British construction of military and civil districts or cantonments that were patterned after European rather than Indian cities. Generally, the number and size of towns increased, with the urban population growing from 8.7 percent in 1871 to 10.2 percent in 1921 due to periodic famine in the countryside and expanding industrialization in the cities.

At the beginning of the eighteenth century the major British colonial cities were Bombay, Calcutta, and Madras. These cities served the British East India Company as commercial, administrative, and military centers and grew rapidly as the company conquered new territories; as a result, during the nineteenth century they became the most populous cities in India. For example, the population of Calcutta grew from 120,000 in 1750 to 350,000 in 1820, while the population of Bombay went from roughly 161,000 in 1816 to 773,000 in 1881. Calcutta served as the capital of British India from 1772, when the first governor-general, Warren Hastings, transferred all important offices to the city from Murshidabad, until 1911, when the capital was moved to the newly built city of New Delhi.

Prior to British conquest, the major cities in northern India, such as Delhi, Agra, Lucknow, Benares, Ahmedabad, and Lahore, were administrative, religious, and commercial centers for the Mughal empire and its successor states. In

1700 Delhi, as the capital of the Mughal empire, had a population of roughly 500,000 and was an important religious center for Hindus, Muslims, and Jains. The city was a major commercial hub for regional and international trade in textiles and agricultural products as well as banking.

In the south, Mysore and Hyderabad were important provincial capitals, while Poona (Pune) served as the capital of the Maratha empire. Hyderabad, the capital of the princely state of Hyderabad, became allied with the British in the 1760s but remained ruled by the nizams or kings until incorporation into the republic of India in 1948. The population of Hyderabad grew from just under 200,000 in 1800 to 367,000 in 1881 and 448,000 in 1901. The city was an important Muslim cultural center with numerous mosques and schools; it also was a major commercial center throughout the eighteenth and nineteenth centuries.

With the crumbling of the Mughal empire, Delhi declined in importance as a cultural, political, and economic center especially after the sack of the city by the Persian warlord Nadir Shah in 1739. In particular, Lucknow, Hyderabad, and Bhopal replaced Delhi (and Agra) as chief Muslim cultural centers. By 1800 the population of Delhi dropped to about 100,000 from a high of about 500,000. Merchants, bankers, and artisans left Delhi for more prosperous and stable cities such as Hyderabad, Lucknow, and Calcutta.

Lucknow became the capital of the kingdom of Awadh in 1775 and grew rapidly under the patronage of the nawab or king. Growing to a population of about 200,000 by 1800, Lucknow became the fourth-largest city in India and served as the home of a distinctive culture. It was a wealthy commercial city that supported large numbers of artisans, attracted by the lavish consumption of luxury goods by the royal court. The city became famous in northern India for its literature, music, and dance and the elegant manners and overall refinement of its people. The city was well known for both its Urdu-language poets and courtesans. The British, however, considered the city to be dirty, decadent, and dangerous especially after the city served as a major center of the rebellion in 1857–1858. Lucknow was also notable for its substantial Shia Muslim population.

COLONIAL BOMBAY

By the late nineteenth century, the British had transformed Bombay into one of India's key trade ports and a major center of industrial production. This photograph, taken by Deen Dayal, highlights the dominance of British colonial architecture as well as the port activity far off in the distance.

—Eric Strahorn

(British Library)

As they conquered new territories, the British initiated numerous changes in the cities they took over. For example, they added new sections to each city for the military, known as cantonments, as well as civil lines for the civilian bureaucracy. These new areas allowed the British to avoid what they considered the dirty, unsanitary, and even dangerous old sections of cities. They also attempted to replicate British cities by building English-style houses, churches, libraries, and race courses. The cantonments also had an important economic impact. For example, the British established a military cantonment in the town of Cawnpore (Kanpur) in 1801. Cawnpore had a population of about 5,000 in 1801 but grew to 30,000 in 1830. Especially after 1860, Cawnpore became a major industrial center due to increased military spending by the British. Merchants from throughout northern India flocked to Cawnpore to set up leather goods workshops and cotton and woolen mills to provide the military with boots, uniforms, and blankets.

Following the rebellion of 1857–1858, the British sought to strengthen their control and prevent further uprisings. In many of the larger cities such as Madras and Bombay, they established new police forces patterned after the London Metropolitan Police and the Irish Constabulary. In cities that had been involved in the rebellion, such as Lucknow, the British did more than create new police forces. They sought to transform them so that they could be better controlled. In Lucknow, they demolished roughly two-fifths of the city, destroying mosques, houses, and entire neighborhoods to make room for wide streets that provided for the more efficient movement of troops. The city declined in importance after the provincial capital was transferred to the city of Allahabad, which itself grew rapidly, doubling its population from 55,000 in 1860 to 120,000 in 1890.

In the late nineteenth and early twentieth centuries the British built railroads connecting the major Indian cities. This altered trade routes throughout India so that Bombay and Calcutta replaced older cities such as Surat as the country's major ports. In turn, this fueled the industrialization of Bombay and Calcutta. By the late nineteenth century these and other capital cities became centers for the Indian nationalist movement. The Indian National Congress was founded in 1885, and its first annual meeting was in Bombay. The northern city of Allahabad was the hometown for Congress party leaders Motilal Nehru and Jawaharlal Nehru and became an important center for the Congress after 1900.

City Growth in East Asia

In 1750, just before the outbreak of political, agricultural, and industrial revolutions of the West, five of the largest cities in the world were in East Asia. The Chinese imperial capital of Beijing was the largest city in the world with a population of more than 900,000, while Edo, capital of Tokugawa Japan, was second with at least 700,000 inhabitants. The “merchants’ capital” of Osaka, the nearby imperial capital of Kyoto in Japan, and Hangzhou of China were also among the world’s top ten cities in the mid-eighteenth century. However, by 1914 Tokyo (formerly Edo), remained the only East Asian city among the top ten of the world’s largest urban areas.

Edo (meaning “bay entrance”) grew dramatically after Ieyasu, the first Tokugawa shogun, designated the once small fishing village as the headquarters of his government in 1600. As the apparatus of bureaucracy and the number of resident samurai grew, so did Edo. Most of the country’s taxes were sent to Edo to pay for the operations and expansion of the shogun’s government. Urban growth was primarily generated, however, by the government’s “alternate attendance” requirement that most of Japan’s 250 daimyo lords spend every other year living in Edo with their immediate family members—who could never leave Edo—and their major vassals. Consequently, the number of servants, merchants, artisans, entertainers, and other townsmen to serve the needs of elite samurai and their families in Edo grew exponentially despite disasters such as the Great Fire of 1657, which burned down more than 60 percent of the city.

Osaka, Kyoto, and Nagasaki also were major cities of politics, culture, and trade in Japan during the Tokugawa era (1600–1867), but the shogun’s government in Edo was able to maintain political control over the country until Westerners seeking trade and rebellious samurai forced the shogun from power in 1868 and “restored” imperial rule. The new imperial government and the newly installed emperor, Meiji, quickly moved to Edo, renamed it Tokyo (meaning “eastern capital”), took over the reigns of political authority, and even took over the shogun’s castle. With the increase in international trade in the

late nineteenth and early twentieth centuries both in Tokyo and in nearby Yokohama, adoption of industrialization policies, and rebuilding of the city (major portions of which had not been rebuilt since the devastating Ansei earthquake of 1855), Tokyo continued to expand. By 1914 it had a population of 3.5 million, the largest city in Asia.

While the urban population and urban space of Edo/Tokyo adapted to natural disasters and a new government consciously adopted Western methods of industrialization in the late 1800s, the Chinese cities of Shanghai and Hong Kong dramatically expanded by being forcibly brought into the sphere of Western colonialism and international trade. After a series of commercial, legal, and political disputes with the imperial government in Beijing in the early nineteenth century, Britain fought and defeated China in what are known as the Opium Wars (so-called because one issue, but certainly not the only issue, was the lucrative and morally questionable trade in the illegal drug). According to the Treaty of Nanjing, which ended the First Opium War in 1842, five Chinese cities, including Shanghai, were opened to residence and unrestricted trade by British and subsequently other Western merchants. In addition, Hong Kong Island was ceded to Britain “in perpetuity.”

At the conclusion of the Second Opium War (or Arrow War) in 1860, the Chinese government ceded part of the Kowloon peninsula on the mainland facing Hong Kong Island to the British; in 1898 China agreed to lease the rest of Kowloon and the adjoining New Territories and islands to the British for 99 years. Hong Kong therefore became a single political entity composed of Hong Kong Island, the Kowloon peninsula, and the New Territories. Situated at the mouth of the Pearl River leading to Guangzhou and the heavily populated Guangdong Province, Hong Kong became an economic boomtown, an international trade and shipping port, and an intersection of British and Chinese culture. At the time Britain took control of Hong Kong Island in 1842, only 1,500 people lived on the island, nearly all of whom were fishermen. By 1860, the population of Hong Kong Island and Kowloon had grown to 100,000. After the New Territories were added at the end of the

nineteenth century, the population of Hong Kong grew to nearly 200,000 people, working as tradesmen, merchants, fisherman, farmers, and factory workers.

Meanwhile, Shanghai was the only one of the five cities opened to Westerners for unrestricted trade by the Treaty of Nanjing that witnessed substantial urban and economic growth in the following decades. Located near the mouth of the Yangtze River, leading to Nanjing, Wuhan, and into the heart of China's agricultural region, Shanghai had been an important transportation and commercial center since the Song era (960–1279 CE). Important in both coastal and river trade, Shanghai also emerged as a major center of cotton manufacture and trade. Native associations controlled most industries and legal institutions of the city and also assisted the many Chinese who fled to Shanghai due to rebellions and famine. Yet government-imposed trade restrictions and piracy historically hampered Shanghai's economic growth. In 1800 Shanghai's population was about 90,000, a substantial city to be sure but far less than the 1.1 million population of Beijing. By 1914, however, Shanghai's population increased more than ten times and was virtually the same as the population of Beijing, which remarkably had not increased during the nineteenth and early twentieth centuries. By 1925 Shanghai was China's largest city and has remained so to the present day. The reason for this dramatic growth was the incorporation of Shanghai into the international trade network as a consequence of the First Opium War. Moreover, its strategic location made Shanghai the entry port for all trade going to major cities located along the Yangtze River in central China.

Cities in East Asia brought into the international trade network, forcibly or otherwise, witnessed the most substantial urban growth from the late eighteenth to the early twentieth centuries. And in Japan's case, uniting both the political and imperial capital in Tokyo and consciously establishing "Western" industrialization policies also significantly contributed to its urban growth. Urban growth in East Asia brought many benefits but also brought problems such as increased crime, public health issues, unemployment, and the environmental pressures of growing populations living in relatively compact

areas. All of these problems would have to be addressed in the twentieth century.

Urbanization in Europe

Europe's population in 1750 was roughly 111 million; a century later it was 209 million, and by 1900 it had added another 100 million inhabitants. In 1750 an estimated 12.2 percent of Europeans lived in cities, and about 19 percent did a century later. By 1910 the portion had doubled to more than 40 percent. Britain was Europe's most urbanized society in 1750, with about 24 percent of its population living in cities, a proportion that doubled by 1850 and rose to almost 80 percent by 1911. Over the same period France went from about 15 percent to 44 percent, and the urbanized population of German states more than doubled, from 28.3 percent in 1850 to 60 percent in 1910.

Capital cities such as London, Paris, and Berlin absorbed much of this growth, but in every country provincial centers grew up and flourished as well. In 1750 London was home to 11 percent of Britain's population, and in 1800 it was still Britain's only city with more than 100,000 inhabitants. In 1800 Europe as a whole had 21 cities—only three of which were in France—with more than 100,000 residents. After a century of urbanization Europe could boast 143 such cities. In 1911 Germany contained 48 of these, while Britain had 39 and France had only 15.

Between 1750 and 1914 population growth and technological innovation accelerated trends

in urban growth and development. By 1914 Enlightenment-era cities had become the aging centers of centrifugally expanding metropolises, transformed by industrialization; readily available gas and electricity; steam, diesel, and gasoline-powered locomotion; revolutions in structural engineering; ever more densely packed populations; and effective systems of public health and administration.

Before the 1850s the Industrial Revolution, which had its origins in rural Britain, gradually gravitated toward towns and cities, creating centers of production in the English Midlands, the Parisian suburbs, and later the German Ruhr Valley. Existing road and river transportation routes delivered coal and raw materials to urban factories and allowed the efficient transport of finished products. Relatively dense populations provided local labor, while ancillary support firms found it convenient to serve multiple industries in close proximity. Navigation canals and then steam-powered railroads drew industrial centers and their suppliers and markets more tightly together, while steam shipping made even transoceanic shipping cheaper and faster. Older port cities thrived and grew in regional importance. Natural population growth in Europe fed cities' increasing appetite for labor, including women and children.

Events such as the Irish Potato Famine of the late 1840s encouraged the movement of poor and unskilled individuals and families to industrial centers such as Liverpool and Manchester and resulted in ever more densely packed slums among whose residents substance abuse and crime became commonplace. Industrial Manchester grew from 41,032 in 1774 to 270,901 in 1830 and more than doubled again by 1900. Skies darkened as soft coal smoke settled above industrial centers and capitals such as Paris and London. Indeed, capitals such as Paris, St. Petersburg, Vienna, and Berlin also served as the industrial centers of their respective countries.

Although plague had disappeared from Europe, new scourges of tuberculosis and especially cholera, which swept from seaport to seaport and inland in a series of pandemics from the late 1820s, killed thousands. Disease prompted major changes in the supply of drinking water and the removal of waste products

Manchester, England was the first and most famous of Europe's new industrial cities. It grew from 25,000 in 1772 to 455,000 in 1851. (North Wind Picture Archives)

to and from cities. Supplying drinking water to burgeoning cities such as Paris (with a population of 550,000 in 1800) and London (with a population of 1 million in 1800) often entailed drawing upon polluted sources. Once cholera was convincingly associated with tainted water (in London), municipal authorities either regulated or took control of this supply. Sewerage and other forms of public sanitation had long been recognized by Europeans as a function of the city government, and urban growth and concurrent patterns of disease attributed to filth prompted concerted civic action in many cities. This is often referred to as the Sanitation Movement, which intensified in the second half of the nineteenth century.

Upgrading infrastructure, especially in capital cities, also often meant clearing away older structures and replacing them with open spaces such as parks and wide streets for carts and carriages. Medieval town walls disappeared from Paris, Vienna, and Florence, their courses becoming broad boulevards that physically and symbolically both joined and divided the old from the new. Neoclassical town planners and military defense officials respectively stressed the beauty and utility of long, straight corridors down which a royal procession or a royal cannonball aimed at rioters might travel at will. Paris's Champs Elysees as well as London's Regent Street and Trafalgar Square represent this public formalism. Planners affected by

the Romantic Movement, who believed in the aesthetic and healthful properties of natural open space, saw to it that even expensive and greatly sought-after urban green spaces needed to be preserved and made available to public use as parks in Paris (Palais Jardin Royal, 1746),

Berlin (Tiergarten, 1772), and Vienna (Augarten, 1775). Budapest built new buildings for its Hungarian parliament during the 1880s, and in the 1830s London replaced its Parliament buildings in grand neomedieval style after fire gutted the old complex.

➤ ALEXIS DE TOCQUEVILLE ON MANCHESTER, ENGLAND

Though perhaps best known for *Democracy in America*, Alexis de Tocqueville traveled extensively throughout England and Ireland in the 1830s and 1840s with the mission of comparing the social and political order of these regions with his native France. The following is an excerpt from his travel notes, which were edited and translated more than a century later in *Journeys to England and Ireland*.

“Thirty or forty factories rise on the tops of the hills I have just described. . . . The wretched dwellings of the poor are scattered haphazard around them. Round them stretches land uncultivated but without the charm of rustic nature, and still without the amenities of a town. . . . Some of these roads are paved, but most of them are full of ruts and puddles into which foot or carriage wheel sinks

deep. Heaps of dung, rubble from buildings, putrid, stagnant pools are found here and there among the houses and over the bumpy, pitted surfaces of the public places. . . . Below some of the miserable dwellings is a row of cellars to which a sunken corridor leads. Twelve to fifteen human beings are crowded pell-mell into each of these damp, repulsive holes. . . . Look up and all around this place you will see the huge palaces of industry [factories]. . . . These vast structures keep air and light out of the human habitations they dominate.”

—Joseph Byrne

Alexis de Tocqueville, *Journeys to England and Ireland*, translated and edited by J. P. Mayer (New York: Doubleday, 1968).

As cities became more crowded, the effective movement of people became ever more important. Horse-powered omnibuses and tracked trolleys moved crowds on already congested streets, and in the 1830s discussions began about the possibility of building an underground railway system for London, with actual construction beginning in 1860. The subway opened in 1863 and was designed to link the inner city with the main railroad terminals that brought workers into the city from the rapidly expanding northern suburbs. Railway stations were in the avant-garde of nineteenth-century cast-iron building construction. Often fusing the new technology of metal framing and extensive use of glass with the Romantic era's Gothic Revival style, rail stations embodied the Victorian desire for efficiency and good taste. Retail trade also took advantage of the new technology at Paris's Bazar de l'Industrie, Milan's Galleria, and Moscow's GUM department store. While Americans used iron to build skyward (the term “skyscraper” was coined in Chicago in 1891), European cities retained skylines dominated by their palaces and cathedrals.

Eighteenth-century cities provided a comfortable level of social life and entertainment for those with the leisure and resources to tap

into them. Coffee houses (Paris had 1,800 cafés in 1788) and chocolate shops, opera houses and theaters, a horse race track or two, and some more or less seedy gambling establishments catered to upper-class tastes. Gin mills, bordellos, and truly seedy gambling houses took the money of beggars and the working poor. Classes mingled in Iberian bullrings and in public parks and gardens, and eighteenth-century London entrepreneurs introduced pleasure gardens with their heady combination of cards, food, music, dancing, and surreptitious sex at Ranelagh and Vauxhall. Smaller cities with hot springs, such as Belgium's Spa and England's Bath, developed to serve the wealthy as they pursued good health and good conversation among their own kind during the social seasons.

Such pleasures and a kind of liberal utopianism fueled later-nineteenth-century urban reform movements, often called Garden City or City Beautiful. Urban planning as a profession had its roots in these attempts to remedy the pathological social and economic conditions among the lower classes by creating urban physical environments with clean air, water, streets, and buildings that were both aesthetically pleasing and fully functional.

City Planning—Haussmann's Paris

City planner Baron Georges-Eugène Haussmann (1809–1891) as prefect of the Seine oversaw a sweeping transformation of Paris aimed at enlarging the city's streets, building architectural landmarks, creating parks, and improving hygiene. Contemporary Paris still bears his imprint, as do cities from Buenos Aires to Lyon that were modeled after the Parisian style.

Louis-Napoléon Bonaparte, who served as president of France from 1848 to 1852 and then as Emperor Napoléon III until 1870, initiated the plans for refashioning Paris for several reasons. The city had only 82 miles (132 kilometers) of sewers and few wells in 1848, so the Seine River doubled as a sewer and a source of fresh water. Hygiene was consequently deficient, with cholera epidemics in 1831 and 1848 killing 18,000 and 19,000 people, respectively. Public parks were rare. Narrow twisting streets and 16 bridges (10 of them privately owned) were insufficient for a city that grew from 1 million in 1848 to 2 million in 1870. Small streets also made it easy to erect barricades during the many political upheavals that followed the French Revolution.

Riders and carriages along the Avenue du Bois in Paris, by Georges Stein, about 1900. (Mary Evans Picture Library/The Image Works)

New construction projects would improve sanitation, employ the restless working class, and make barricades less effective. Napoléon III dreamed of matching the achievements of his uncle Napoléon I, who had built the Ourcq Canal and several bridges in Paris, and even of Roman Emperor Augustus, who had beautified ancient Rome. In addition, the project would put into practice Comte de Saint-Simon's semimystical Christian-Scientific socialism, a philosophy that appealed to the emperor. It would also satiate Napoléon III's personal passion for architecture and create gardens similar to those he had enjoyed while in exile in London.

A few projects, including the lengthening of Rivoli Street, began as early as 1848, but the opposition of Jean-Jacques Berger, prefect of the Seine, to deficit spending convinced Napoléon III to replace him in 1853 with the more proactive Haussmann. Haussmann, a lifelong civil servant with an authoritarian personality, had a virtual blank check since Paris had no elected city council and he enjoyed direct access to the emperor.

Following a survey to draw an accurate map of Paris, Haussmann added 90 miles (145 kilometers) of streets and improved many existing ones. Such streets were large (the Avenue de l'Impératrice reached a record width of 460 feet or 140 meters), paved with asphalt rather than cobblestones, lit with gas, and lined with stone buildings of standardized design. Avenues frequently ended on large new edifices to provide monumental vistas. Among them were new wings linking the Louvre to the Tuileries Palace; a prefecture of police, a court of justice, and a hospital (Hôtel Dieu) on the Ile de la Cité; an opera house; and central markets in the Halles neighborhood.

Haussmann's collaborator Adolphe Alphand (1817–1891) was charged with creating large parks in the English style. The Bois de Boulogne on the city's west side was considered such a success with its winding alleys, race track, waterfall, and internal lake that Alphand built four similar parks in Vincennes, Buttes Chaumont, Parc Monceau, and Montsouris. A network of smaller neighborhood parks throughout the city pushed the total area of public parks from 47 to 4,500 acres (19 to 1,821 hectares).

Less glamorous yet essential to improved hygiene were waterworks designed by engineer

Eugène Belgrand (1810–1878). An ambitious plan to draw water from the Soude-Somme spring 114 miles (183 kilometers) away was abandoned, but several smaller aqueducts improved the city's water supply. A network of modern sewers, linked by a siphon built under the Seine River, collected all waste and directed it to a large collector at Asnières, where it was recycled or released downriver from the capital.

The cost of these ambitious projects totaled 2.5 billion francs from 1850 to 1869, or 44 times the annual budget of the entire city. Haussmann financed most projects by borrowing, hoping that growing revenue would offset the initial investment. Facing opposition in the National Assembly, however, he failed to request proper approval before contracting many such bonds. The ensuing political scandal forced Haussmann's resignation in 1870. The Franco-Prussian War (1870–1871) and the advent of the Third Republic (1871–1940) brought an end to most ongoing projects. Haussmann's influence was lasting despite his undignified departure.

Housing Reform

With the onset of industrialization and urbanization, social reformers such as Robert Owen (1771–1858), Friedrich Engels (1820–1895), and Octavia Hill (1838–1912) voiced criticism and dissatisfaction with the living conditions of working-class families. The existence of poor housing conditions for lower-class families concerned these thinkers and activists, as these conditions appeared to endanger the very existence of civilized life. However, social reformers differed greatly over the reasons and character of as well

as the solution for the perceived Social Question. While many social reformers saw the Social Question as a direct consequence of economic inequality and therefore as a side effect of unrestricted capitalism, others, such as Octavia Hill, took into consideration the cultural dimensions of the substandard living conditions of the lower classes.

Since England had a head start in industrialization, it faced its social repercussions much earlier than all other countries. In response to the emerging housing problem for the lower classes, London took a lead in developing various concepts for the provision of working-class housing within modern cities. Housing trusts (Pure Philanthropy), limited dividend housing companies (Philanthropy and Five Percent), and the concept of friendly rent collecting proved to be the most successful strategies that attracted social reformers from various cities in continental Europe and North America. Three individuals (George Peabody, Sydney Waterlow, and Octavia Hill) dominated the landscape of housing reform for much of the nineteenth century.

In 1862 George Peabody, a successful Massachusetts merchant, decided to donate £500,000 to benefit the London poor. This gift was used to create a housing trust, which was to provide healthy and affordable housing for working-class

The model buildings in Peabody Square, Blackfriars Road, London. Built by the American philanthropist, George Peabody as “working men’s tenements” for the poor. (Hulton Archive/Getty Images)

➤ HERRMANN JULIUS MEYER

After much success as the owner of the German publishing house Bibliographisches Institut, Hermann Julius Meyer (1826–1909) retired in the 1880s and dedicated his life to social reform. Inspired by George Peabody's housing trust in London, Meyer provided nearly 19 million marks for the construction of four large settlement projects for working-class families in Leipzig. This housing trust became the largest such institution in Germany. Meyer insisted on providing housing only for those who were in real need and who fit his image of the ideal family. Renters had to comply with a variety of requirements. Only workers with a steady income between 800 and 1,800 marks per year were admitted. Earning more than 1,800 marks might result in the renter being expelled from his apartment.

Meyer also insisted that only families with three to five members should be admitted as renters in his apartments. Therefore, he instructed his architect to build buildings four stories high with apartments that provided sufficient space for such a small number of people. Subletting was prohibited and would lead to immediate cancellation of the rental contract. Meyer's first settlement project in the Leipzig suburb of Lindenau consisted of several apartment buildings that were subdivided into smaller houses with multiple entrances and staircases so that long hallways and thus contact between renters were avoided. The buildings surrounded a large inner place with small plots of gardens that were leased to the tenants.

—Thomas Adam

families in and around the British capital. This philanthropic enterprise soon received competition from Sydney Waterlow's Improved Industrial Dwellings Company, founded in 1863, that was based on the idea that affordable housing could be produced while guaranteeing a limited profit of 5 percent. Both concepts found admirers and imitators all over Europe and North America. Over the next three decades, housing trusts and limited dividend companies appeared in many European and North American cities. Within Germany, Herrmann Julius Meyer, the owner of the world famous publishing house *Bibliographisches Institut*, followed in Peabody's footsteps. Starting in 1887, Meyer created the largest German housing trust in the city of Leipzig. Henry I. Bowditch, a wealthy Boston physician, introduced Waterlow's model to the United States. In 1871 Bowditch convinced 163 wealthy Bostonians to join him in the creation of the Boston Cooperative Building Company, which was one of the first American limited dividend housing companies.

Bowditch was also the first to introduce to an American audience Octavia Hill's ideas about house management and the improvement of the conditions of the poor. Since 1864 Hill had taken over the management of several thousand apartments for lower-class tenants

in London. In contrast to Peabody and Waterlow, Hill was convinced that the housing crisis could not be solved solely by economic reform (namely, higher incomes for workers); any solution must include cultural and moral education. Hill championed the principle that the poor need as much instruction and guidance as they need economic improvement. According to her concept of friendly rent collecting, renters had to pay the rent weekly in advance, and the rent was collected by upper-class women (the nineteenth-century version of social workers). These women were expected to establish friendly relations with the tenants and were in charge of teaching the tenants standards of cleanliness and orderly behavior.

Based on this assumption, Hill created during the 1860s a model for social housing that attracted the attention of housing reformers from Russia, Germany, the United States, and South Africa. In the ensuing decades, Hill Associations were founded in Amsterdam, Berlin, St. Petersburg, Philadelphia, and New York, to name just a few prominent cities; her writings were translated into German, Russian, and many other languages. Hill's ideas even influenced modern city planning in Japan. Seki Hajime publicly professed his intellectual debt to Hill when he developed his solution to the housing crisis

of Osaka during the 1920s. In South Africa the government adopted Hill's ideas for developing a state-sponsored training program for women housing managers, who were employed to administer the colored and European townships in the country's largest municipalities of Port Elizabeth, East London, and Johannesburg from the 1930s onward.

The Growth of Cities in the United States, 1820–1914

The process of urbanization—the shift from rural, agrarian communities to an urban industrial society—occurred steadily after 1820 in the United States. In that year there existed only 56 towns with 2,500 to 25,000 residents, and 5 large cities. By 1870, these numbers exploded to 612 towns, 45 cities, and 6 metropolises with over 250,000 inhabitants. In this period, immigrants were arriving en masse from Europe, many having been actively recruited by railroad companies and midwestern states that desired to populate their fertile farm land. Those not settling as yeoman farmers settled mostly in crowded cities, contributing to congestion and urban growth, as well as to industrial production.

During the 1860s and 1870s, the bulk of European newcomers arrived from northwestern Europe, primarily from the British Isles, the German states, Scandinavia, and Switzerland. These European source areas expanded after 1880 to include immigrants from southern and eastern Europe. The vast majority of all immigrants avoided the American South, given the

dominant plantation agricultural system that provided little industrial incentive for newcomers. The Civil War did little to alter this migration pattern. With increased industrialization came a more rapid shift to urban areas, so that by 1880, the urban population had become 28 percent of the total population, compared with 11 percent in 1840.

As linear business blocks appeared along small town main streets, larger urban downtowns were undergoing immense changes of their own. *Downtown* refers to the center city in general, including the mixed land uses of industry, retail, hotels, warehouses, office space, theaters, and tenements. The term downtown originated in New York, due to the location of the financial district at the southern tip of Manhattan. As the American frontier moved west, newer cities were laid out with specialized business districts in mind. The modern central business district, or CBD, appeared in larger cities during these postwar decades and encouraged specialized land-use zones. The CBD became the office core of downtown, often including high-end retail options and entertainment venues.

The bidding process for valuable urban space encouraged industrial activities to separate from the office core of the city, accompanied by a similar "filtering out" of social and ethnic populations and classes. During these decades, residential districts became more socially, ethnically, and occupationally similar and less diverse. Prior to the 1860s, most large cities had contained a great mixture of wholesale and retail traders, financiers, professionals, craftsmen, government workers, and a wide variety of residences and social classes all mixed together. By the 1880s, larger cities witnessed a new pattern of concentric land-use rings. Progressing outward from the CBD was the industrial zone, working-class neighborhoods, wealthier suburbs, and finally the agricultural hinterland. This urban pattern still generally characterizes today's larger American metropolises.

New industrial wealth enabled the upper and middle classes to escape the congested city of "teeming masses," leading to a growing demand for suburban housing. The poorer classes, full of immigrants, remained in the central city to rent in slum or near-slum conditions. When

substantial numbers of African Americans migrated to northern industrial cities, they competed with immigrants at the bottom of the social hierarchy.

Tenement apartments often lacked heating, windows, running water, indoor plumbing, and proper sewers. Approximately one in five urban families took in boarders during the nineteenth century, despite crowding. Even worse, the homeless were left to find sleep in doorways or alleys. There were no public housing developments or medical services during this time—only a few charitable associations to cope with the needs of millions.

Philanthropists attempted numerous experiments with subsidized housing for the poor, though such efforts were generally short-lived due in part to mismanagement. Overcrowding and poor sanitation led to epidemic outbreaks of disease: tuberculosis, cholera, diphtheria, and influenza claimed as many lives as did industrial hazards. As commentators fretted on the revolutionary potential of downtrodden urban masses, the efforts of private charities eventually gave way to Progressive era legislative reforms. These collective efforts led to some much needed improvements by 1900, such as reducing infant mortality, vocational training for ghetto youths, the advent of kindergartens to ease working mothers' daily problems, the creation of parks and playgrounds, housing codes, and increased attention to slum conditions. The failure of these measures to eradicate urban poverty in a time of unprecedented wealth, however, led to the conclusion that the root causes of poverty were not to be found in the quality of the physical environment alone.

At the same time as Progressives sought urban reform, newer suburban communities drew away middle- and upper-class populations. Between 1815 and 1860, the cities of New York, Philadelphia, Boston, and Chicago exhibited the most extensive suburban growth yet witnessed in the world. The urban poor and African Americans led the way to the periphery during the early nineteenth century. By the 1850s, however, the country borderlands beyond the city were increasingly discovered by middle- and upper-class families.

The American suburban ideal was entrenched prior to the Civil War. Around Chicago,

for instance, a variety of country homes and “villa-residences” had already materialized. Only after 1865 did the horse railways of Chicago—combined with existing steam railroads—fuel an even more rapid transition of families to that city's periphery.

A series of innovative transportation improvements allowed ever more American families to realize the new suburban dream. Two inventions had already provided access to the borderlands by the 1840s. Steamboat service, particularly in New York, up the Hudson River, and around Long Island, enabled many families to live in outlying small towns. Brooklyn began to prosper with middle-class commuter families. It was railroad travel that precipitated a revolution in suburban living, however. It made possible the success of places like Llewellyn Park and additional square miles of borderland country cut into 1- to 3-acre (0.4 to 1.2 hectare) lots.

By the 1870s, political alliances—known today as urban “growth machines”—had organized for mutual self-interest. These were coalitions of growth proponents that viewed suburban development on massive scales as economically beneficial. Real estate developers, land owners, and city boosters learned to promote urban peripheries systematically, often in partnership with transit owners, utilities, and local governments. Following the Civil War, America's largest cities underwent dramatic spatial change. A combination of steam ferry, omnibus, commuter railroad, horse car, elevated railroad, and cable car enabled cities to virtually turn themselves “inside out.” This new distribution of population was governed primarily by growth coalitions enhancing their investments by attracting the wealthy and excluding the poor. The number of commuters between suburb and city center increased as businessmen opted for the benefits of country living, within an easy and cheap commute of downtown.

Of course, millions of workers and their families, concentrated in vast urban slums, could only dream about suburban life. By the end of the nineteenth century, an estimated two of every three American urban residents were still tenants, most of them living in crowded tenement buildings.

American Urban Landscape Architecture—Frederick Law Olmsted

Frederick Law Olmsted (1822–1903) is one of the pioneers of landscape architecture in the United States and the designer of the first generation of great urban parks in the country. In addition to his work as a landscape architect, Olmsted had worked as a journalist and as the secretary of the U.S. Sanitary Commission during the American Civil War. His work as a landscape architect and his pioneering ideas about the ideal city form were continued by his son Frederick Law Olmsted Jr. and by other colleagues in his landscape architecture firm.

The list of Olmsted's projects for green areas, urban parks, parkways, and other landscape projects in New York state is long and includes Central Park and Prospect Park in New York City, Buffalo Park and Parkway System in Buffalo, and the Niagara Falls State Reserve. He also was key to the planning of the Emerald Necklace in Boston; several sections of the 1893

➤ CITY BEAUTIFUL MOVEMENT

The City Beautiful Movement developed in the transition from the nineteenth century to the twentieth century (1897–1902) as a response to the challenges created by the industrialization and the urbanization of the United States as well as an attempt to upgrade the appearance of cities. It was part of a wider process of social and urban reform developed in the context of the Progressive Era ideals and was influenced by what had been done in Europe under the classicist principles of the Beaux Arts School of Paris (e.g., in the boulevards of Paris, under the guidance of Haussmann, and in the construction of the Ringstrasse in Vienna) and by an eclectic combination of aesthetic ideals previously applied in cities all over the country. Daniel Burnham, a Chicago-based architect responsible for several classic buildings in that city and the leader of the team responsible for the construction of the World's Columbian Exposition in 1893, was the leading figure of the City Beautiful Movement. He was also the head of the team responsible for the design of the 1901 McMillan Plan for Washington, a team that also included Frederick Law Olmsted Jr. The priority given to beauty by the City Beautiful Movement was replaced in the 1910s by a focus on the functionality of the city and by the idea of planning as a comprehensive activity. This marked the birth of American city planning, a process in which Frederick Law Olmsted Jr. played a key role.

—Carlos Nunes Silva

Chicago World's Columbia Exposition, whose general plan was designed by Daniel Burnham; Belle-Isle Park in Detroit; Piedmont Park in Atlanta; the area around the United States Capitol in Washington, D.C.; the landscape design for dozens of college and university campuses; Cherokee Park in Louisville; Golden Gate Park in San Francisco; Mount Royal Park in Montreal, Canada; and the design and planning of several major suburbs (e.g., Riverside, Illinois; Moraine Farm, Beverly, Massachusetts; and Biltmore Estate, North Carolina).

The project for Central Park in Manhattan, New York, is perhaps his best-known work. The creation of this park was first proposed in the 1840s by, among others, Andrew Jackson

Downing (1815–1852), the first notable American landscape architect. Downing was inspired by Hyde Park in London and by the Bois de Boulogne in Paris. In 1853 city authorities decided to create such a park in the middle of the island of Manhattan, and a design contest was launched in 1857. Olmsted and his partner, the English-born architect Calvert Vaux (1824–1895), submitted the winning proposal. The construction lasted from 1858 to 1876 on land that included swamps and shanties. Calvert Vaux had been the lead designer and had begun planning with Downing, who died soon after the partnership started. Following the death of Downing, Vaux invited Olmsted to join the project, which was the start of a long and fruitful collaboration in the planning of urban parks.

Central Park was designed in terms of the republican ideal common to early-nineteenth-century discourse, that is, that all the citizens of a democracy ideally should be inculcated with virtue in order to better contribute to the society. Along with other proponents of the city parks movement, Olmsted hoped to create an urban retreat where people from different social classes could safely mingle and be ennobled by natural vistas, thereby lessening social tensions in the city between wealthy and poor.

Among other influences, Olmsted's landscape architecture reflected the European urban parks he visited years before as well as the fruitful collaboration he developed with Calvert Vaux. Olmsted traveled in Europe on several occasions in the 1850s and visited several cities and urban parks in Europe. Birkenhead Park, opened in 1847 near Liverpool, England, made a particularly strong impression on him.

Olmsted's vision in part was a forerunner of the later City Beautiful Movement, which was based on Progressive Era ideals about urban reform. According to this perspective, civic virtue would result from city beautification and from Beaux-Arts classicism, which had in Daniel Burnham and Charles Mulford Robinson two of its most active practitioners.

Olmsted's legacy was continued by his son Frederick Law Olmsted Jr., one of the two most important landscape architects to practice City Beautiful planning, the other being John Nolen. Frederick Law Olmsted Jr. worked within

the boundaries of the City Beautiful movement but also in the formation of city planning. By becoming involved in city planning, which was understood as a continuous and comprehensive planning process, the younger Olmsted distanced himself gradually from the progressivist ideal behind city beautification and embellishment.

Mass Transportation

Preindustrial communities were typically small in both population and land area. Work and home were close together, so the question of the journey to work was not significant. People walked when they needed to get somewhere, but with the possible exception of taking goods to market, distances were short for the majority of the population.

All this changed with industrialization. As cities grew larger and population densities increased, the need grew for efficient mass transport in cities. To accomplish this required the creation of a system in which regularly scheduled passenger services operated on a predetermined route, using shared vehicles. The first such systems were privately owned and operated but, increasingly, came into public ownership because of their importance to the urban infrastructure.

The largest cities experienced the problem of how to move large numbers of people around the city first. The solution generally was

in the form of short-stage horse-drawn coaches operated by private entrepreneurs or for-hire horse-drawn taxicabs. London's experience was typical. By the beginning of the nineteenth century London had become an international financial center, the country's largest port, an industrial center, and the center of government. Its population was about 1 million by 1800, increasing to 1.75 million by 1831. As businesses expanded, they frequently took over the most central sites; those residents who could afford to move did so, but the poorer sections of the city became increasingly overcrowded and congested.

Privately operated horse-drawn coaches had been operating since the 1760s to and from the villages just outside central London. By the 1820s, about a fifth of all stage coaches licensed in the country, about 600, operated in the London area. Their design made them unsuitable for extended travel on city streets, however, and they were expensive (horses were expensive to look after, and license fees and mileage duties increased their operating costs), thus putting them out of reach of most working people.

A better design—simply a box on wheels that was easy to get into and out of—had been pioneered in Paris, where in 1828 100 of these so-called city coaches were in operation. This design was adapted by a London coach builder, George Shillibeer, to carry 20 passengers pulled by three horses. The first, known as Shillibeer's omnibus, started operations in July 1829. Shillibeer added more, and competitors started operating smaller omnibuses holding 12 passengers.

The costs of operating omnibuses in London fell as the mileage duty was reduced. The number of passengers who could be carried increased with the addition of lengthwise seats on the top, the first double-decker buses. Similar horse-drawn buses operated in all major cities. In the United States, the first ones were used in New York City in 1829 and in Philadelphia in 1831. Some cities, including London and New York, improved the smoothness of the ride by laying iron rails in the streets, flush with the surface to avoid disrupting other traffic.

Steam engines had been adapted for use by riverboats early in the nineteenth century, and most major cities saw them in use. The problem

with adapting the steam engine to land transport was the size: early steam engines were too heavy for ordinary roads and required specially built tracks for street railway use. London's first such steam-powered street railway opened in 1836.

A later alternative to street-level steam railways were cable-hauled systems. With these, a continuous-loop cable was laid just under the road surface, turned by a large steam engine located in a central powerhouse. Each carriage attached itself to the cable and was hauled along its route as the cable moved. London's first such cable rail line opened in 1841. In the United States, 23 cities operated cable systems in 1890. Soon after, they were replaced by electric traction systems except in San Francisco, where cable cars proved more suitable than electric traction for the hilly terrain.

Mass-transportation systems still created enormous road congestion, especially as cities grew larger. In the second half of the nineteenth century, attention began to turn to solving this problem. New York City adapted the steam railway to the city by putting it above street level on an elevated track (the el), opening its first elevated line in 1876. An alternative was to go underground. The first underground passenger railway, 3.5 miles (5.6 kilometers) in length, opened in London in 1863. Initially it was not a completely closed underground system, as the steam locomotives had to periodically vent built-up steam in one of the cuttings that existed along the tracks. As the system expanded, ventilation remained a problem, partly solved by the changeover to electric traction at the end of the century. Once deep-level lines were built, ventilation fans were a necessity.

The first application of electricity to urban mass transit was in Richmond, Virginia, in 1888, using power from overhead lines. In London, the electrification of tramways developed slowly, with the first being opened in 1901, but speeded up with the decision to electrify the former horse tramways in the center of the city in 1903. The first application of electricity underground in 1890 was not successful, as the line was too small and underpowered, but ones built by private entrepreneurs after 1900 were more successful once technology had developed sufficiently to enable larger trains to be powered by electricity.

The impact of electrification, both underground and on the surface, was great. It was much cleaner than horses and quieter than steam, although the generation of electricity contributed to a different type of pollution, as did the later changeover to liquid fuels. Fast, improved access to the center of the city permitted residential growth outside, following the new lines. Aboveground, the shift to gasoline- or diesel-powered buses, replacing earlier electric battery or steam buses, began in earnest after 1890. These buses were cheaper to operate than horse-drawn ones and could carry more passengers. In London in 1911, only 13 percent of all passenger vehicles were still horse-drawn, a share falling to 6 percent by 1913.

In continental Europe, the Paris Metro opened its first line in 1900, although plans to build an underground rail system there dated back to 1845. Its carriages were made of wood and offered both first- and second-class carriages, a two-class system that remained in place until 1991. The Berlin U-Bahn opened its first line in 1902.

The building of underground systems was slower in the United States. The first was a short line in Boston, opened in 1897, and the first in New York City was opened in 1904. Both of these systems were initially built by private interests. In the United States, public transit systems reached a peak passenger load of 17.2 million in 1926 but then began losing riders due to competition from private automobiles.

■ Introduction: Thinking about Nature

Throughout the ages, human beings have speculated about the meaning and significance of the natural world. In eastern Asian thought, nature was a source of beauty and a guidepost to discovering the "Way." To many religions, it was revered as the dwelling place of the gods and spirits who had the power to confer or deny sustenance. Hindus, Buddhists, and Jains taught that nature was sacred, leading some to adhere to *ahimsa*, the doctrine of non-violence toward all living things. Europeans tended to view nature as an adversary that could benefit humankind if dominated and controlled. Only with the rise of environmentalism in the past two centuries has nature come to be viewed as something needing to be conserved, preserved, and protected from human damage.

Although environmentalism as a broadly supported activist social program is conventionally dated from the 1960s, concern over protecting

nature goes back to the late eighteenth century. Not surprisingly, such a concern originated at a time when nascent industrialization, growing population, and Europe's worldwide commercial expansion all contributed to increasing the scale and intensity at which humans were using and abusing the natural world. By 1800, commercial hunting had seriously depleted the populations of beaver, sable, ermine, and other fur-bearing animals in North America and Siberia. Demands for fuel, farmland, building materials, and ship construction had increased wood consumption to the point at which deforestation and soil erosion became matters of concern for European governments and European colonial administrators in India, the Caribbean islands, and the Indian Ocean island of Mauritius. As industrialization took root in Europe and spread to the United States and Japan in the nineteenth century, urban crowding, inadequate systems

for waste and sewage disposal, polluted water supplies, and smoke pollution all came to be understood as pressing environmental issues.

As a result, during the eighteenth and nineteenth centuries organizations dedicated to environmental causes proliferated, and governments in many parts of the world adopted policies to limit pollution and protect wilderness areas from uncontrolled exploitation. Efforts to preserve forests from overuse date back to the Middle Ages in Europe, but government-sponsored scientific forestry emerged only in the eighteenth century, when a number of German states adopted forestry programs based on detailed survey techniques, studies of growth rates, systematic replanting programs, and regulation of forest use—all under the direction of professional foresters. German forestry schools provided a training ground for foresters of many European nations and the United States, and German foresters provided leadership for new conservation programs in several states, including the United States and British India. The success of scientific conservation programs inspired the work of the American George Perkins Marsh (1801–1882), whose *Man and Nature* (1864) warned against mankind's profligate use of forests and other natural resources. Forests, he argued, should be preserved not only for their wood but also for their capacity to prevent floods, limit soil erosion, protect watersheds, and provide habitat for wildlife.

For Marsh and advocates of early forestry programs, the purposes of conservation were basically utilitarian. For many of their contemporaries, however, the preservation of nature had a spiritual and moral dimension. A line of philosophers, poets, essayists, and mystics stretching from the late 1700s to the early 1900s declared that nature provided more than products to warm, clothe, and feed human beings. More importantly, it served as a source of moral inspiration, self-awareness, spiritual insight, peace, comfort, mystery, and succor and as an antidote to the commercialism and materialism of industrial society. Such convictions inspired movements to preserve wild habitats and wild species, which in turn led to the beginnings of the national parks movement and the founding of wildlife reserves in many parts of the

world including Africa, where big-game hunting and habitat loss threatened populations of elephants, rhinoceroses, hippopotami, and many large carnivores.

Yet another type of early environmental activity was centered in the very industrial cities that Romantic poets and transcendentalist philosophers found so threatening and repugnant. Inspired by concerns for public health, the needs of manufacturers for adequate water supplies, and crises such as London's "Big Stink" of 1858 (caused by the stench emanating from the Thames River), major cities in Europe and North America installed or upgraded sewer systems, piped in clean water, and made efforts to remove the mountains of garbage their residents produced every day. Reformers also succeeded in setting aside or expanding open spaces for urban parks, where city dwellers would have opportunities for recreation and at least some limited contact with trees, lakes, and green grass.

Efforts to protect the environment in the eighteenth and nineteenth centuries had some notable successes. By the late 1800s, scientific forestry was being practiced in many parts of the world, and many millions of square miles of forests were being regulated and managed by government agencies. The construction of sewer and clean water systems undoubtedly made big-city life healthier, especially in the United States, Europe, and the British dominions.

One should not, however, exaggerate the level of environmental awareness in the 1800s or the number of environmental success stories. Many individuals remained convinced of nature's limitless bounty (despite mounting evidence to the contrary) or resisted environmental reforms because they were too expensive or flew in the face of individualism and economic opportunity. The relatively small numbers of people who joined environmental organizations were drawn mainly from the middle and upper classes. They were, for example, the main supporters of programs for urban smoke abatement; their efforts were opposed by members of the working class, who depended on cheap coal for heat and feared job losses if manufacturers were forced to restrict production or install expensive equipment. Many environmental "solutions" papered over rather than solved problems.

Garbage often was hauled out of cities only to be dumped offshore or burned; untreated sewage typically was discharged into rivers beyond the city limits with little thought given to downstream environmental damage.

In other cases, environmental activism was too little and too late. Beginning in the late 1800s a number of groups in Europe and elsewhere were formed to protect species of wild animals. The Royal Society for the Protection of Birds, founded in England in 1889, and other similar organizations had some success in halting the slaughter of birds whose plumage was used to decorate women's hats and army officers' uniforms. In 1900 what is often referred to as the world's first international environmental conference met in London to consider ways to protect African animals from overhunting. The European colonial powers in attendance signed a convention that protected gorillas, giraffes, and chimpanzees and limited hunting of gazelles and elephants. It did little good, however, for lions and cheetahs, which were classified as vermin and whose hunting was encouraged. Nor could such steps erase the damage of what man the predator had already caused in the 1800s: extinctions of the American passenger pigeon and countless other small mammals and birds, the collapse of Pacific whale and seal populations, dangerous reductions of African and Indian big game, and the reduction of the immense American bison herds from an estimated 30 million animals around 1800 to less than 1,000 a century later.

—James H. Overfield

The Enlightenment Tradition—Thinking about Nature

The European Enlightenment was marked by many diverse ways of thinking about nature and its relationship to humanity. Although there were many disagreements and contradictions in Enlightenment views about nature, a few themes can be picked out. In thinking about nature, the Enlightenment built on the Christian tradition by concentrating on its usefulness for humans. The use of land for the maximum benefit of humanity was a moral value and a criterion

for ranking civilizations. Scottish Enlightenment thinkers such as economist Adam Smith (1723–1790) divided history into four stages defined by a relationship with the land: hunter-gathering, pastoral, agricultural, and commercial. Progress through the stages was seen as a process of improvement. It continued in the Enlightenment's own time through the often violent displacement of herding peoples, hunter-gatherers, and other people not making the full use of their land, such as Scottish Highlanders and Native Americans, by more “civilized” peoples. The process by which unproductive wilderness was turned into productive agricultural land often involved the transformation of unowned or communally owned land into private property on the European model. Those natural features that prevented agriculturalists from making full use of land, such as mountains or economically useless trees, were condemned as blemishes.

None of this means that the thinkers of the Enlightenment were universally hostile to or contemptuous of nature. The tradition of natural theology—of using nature to demonstrate the existence and attributes of God—remained powerful in the eighteenth and early nineteenth centuries and increasingly drew from the evidence of natural history as well as physics. It received a classic formulation in William Paley's *Natural Theology, or, Evidences of the Existence and Attributes of the Deity* (1802). The beauty and glories of nature were widely praised, particularly by botanists and zoologists such as Georges-Louis Leclerc de Buffon (1707–1788), director of the Royal Botanical Garden in Paris, and Swedish inventor of modern biological classification Carolus Linnaeus (1707–1778). The writings of eighteenth-century naturalists such as the Anglican minister Gilbert White (1720–1793) reflect a deep love of nature, as shown in the close observations recounted in his frequently reprinted *The Natural History and Antiquities of Selborne* (1789). The study of nature was regarded as a way of improving the mind, and natural history in particular became a popular avocation among many.

Gardens and parks were widespread, and public ones such as London's Hyde Park were popular recreation spots. Many wealthy

landowners devoted a large portion of their land and wealth to the creation of ornamental gardens, such as Thomas Jefferson's gardens at Monticello. However, the point of eighteenth-century gardens and parks was to show nature as shaped by the hand of humanity. The lack of interest in preserving the land in its original state can be seen in the wide popularity of exotic plants as garden ornaments. The rigid geometry of the formal garden of the age of Louis XIV (r. 1643–1715) had been abandoned in favor of something more adapted to the contours of the land, but no one would mistake the eighteenth-century garden for a wilderness. The activity that did promote keeping large areas of land in something close to their natural state was hunting, the sport and often the obsession of European aristocrats and nobles. The Enlightenment monarch Frederick the Great of Prussia (r. 1740–1788) was one of the few European rulers who disliked it.

Many believed that the cultivation of the land improved not merely the land but also the cultivator. French Enlightenment champion Voltaire's novel *Candide* (1759) ends with the famous line "let us cultivate our garden" ("il faut cultiver notre jardin"), which shows that *Candide* has given up his world-spanning ambitions and has settled on a poor but contented life. The image of the virtuous farmer in contrast with the corrupt city dweller occurs frequently in the propaganda of the American Revolutionary era. However, the farmer, particularly the European peasant, was not seen as someone who had perfected a craft but instead as someone who would benefit from advice. Agricultural improvement was a popular cause in the eighteenth century, spawning numerous societies and publications even if its impact on actual farming practices was limited. Some groups working for agricultural improvement were gatherings of local landowners, while some, such as the Paris-based Royal Society of Agriculture, were backed with state power and resources.

One area where much of the Enlightenment, particularly the radical and skeptical Enlightenment, differed from mainstream Christianity was that it saw humanity as part of nature rather than separated from it by the possession

➤ THOMAS JEFFERSON ON LAND AND INDIANS

In 1803 President Thomas Jefferson wrote this letter to Indian Agent Benjamin Hawkins expressing his views on Native Americans, settlers, and the changing uses of the land:

"I consider the business of hunting as already become insufficient to furnish clothing and subsistence to the Indians. The promotion of agriculture, therefore, and household manufacture, are essential in their preservation, and I am disposed to aid and encourage it liberally. This will enable them to live on much smaller portions of land, and indeed will render their vast forests useless but for the range of cattle; for which purpose, also, as they become better farmers, they will be found useless, and even disadvantageous. While they are learning to do better on less land, our increasing numbers will be calling for more land, and thus a coincidence of interest will be produced between those who have lands to spare, and want other necessities, and those who have such necessities to spare, and want lands. This commerce, then, will be for the good of both, and those who are friends to both ought to encourage it."

—William E. Burns

of a soul. As such, humanity, like animals and plants, was shaped by its natural environment. *The Spirit of the Laws* (1748) by Charles-Louis de Secondat, Baron de Montesquieu, ascribed many aspects of human society to the different climates in which different societies had developed.

Natural History and the Roots of the Modern Environmental Movement

While environmental thought dates back to the ancients, the roots of modern environmentalism are commonly traced to two intellectual movements of the eighteenth and nineteenth centuries: the Enlightenment and Romanticism. Whether one interprets the latter as a reaction to or as an outgrowth of the former (the latter opinion now predominating), historians generally portray the modern environmental movement as emanating in part from the scientific rationality of the Enlightenment and in part from the Romantic ideal of a holistic and sublime nature.

Notably, the three particular events most widely associated with the dawn of modern environmentalism—the 1962 publication of *Silent*

Spring by Rachel Carson, the 1901–1909 presidency of Theodore Roosevelt, and the 1864 publication of *Man and Nature* by George Perkins Marsh—allude more to an Enlightenment heritage than to Romanticism. In all three of these chronologically disparate events, each identified individual shared two important characteristics: a thorough understanding of the scientific process and a belief that public policy should be based on scientific knowledge. Carson was a scientist, Roosevelt nearly so, and although Marsh avowed that he was not a scientist, his writings demonstrate a talent for synthesizing scientific information. Although densely written, Marsh's tome remains remarkably cogent today inasmuch as it presciently identified a now-familiar suite of threats to species, forests, water, and deserts. The book certainly takes pride of place as the first focused treatment of problems that we now generically characterize as environmental (a term unavailable to Marsh, who used the term “physical geography” in roughly the same way that we now define the term “environment”) and the first to make a strong and articulate call for the more rational use of the earth's resources.

Carson, Roosevelt, and Marsh also held beliefs about nature that were essentially Romantic, and it would be wrong to make a sharp distinction between the rationalist and Romantic tendencies in their worldviews. This interwoven complexity is prefigured in the natural historians of the eighteenth and nineteenth centuries, many of whom strongly influenced the thinking of Marsh and his successors. Notable figures of this period include the French Comte de Buffon (1707–1788), who first articulated the principles of biogeography; the Swede Carolus Linnaeus (1707–1788), the father of modern taxonomy; and the English curate Gilbert White (1720–1793), whose 1789 *Natural History of Selborne* remains the fourth most-often published book in the English language. Along with their peers, these natural historians falteringly pushed forward the haphazard development of various protoecological concepts, concepts that would eventually come to be subsumed under the rubric of “ecology” although that particular word would not be coined until 1866 by the German biologist Ernst Haeckel (who would define ecology as “the investigation of the total relations of the animal both to its inorganic

George Perkins Marsh's 1864 work *Man and Nature*, republished in 1874 as *The Earth as Modified by Human Action*, is considered a classic of the early environmental movement. (Library of Congress)

and to its organic environment”). One critical concept was that nature appeared as it did due to the effects of species interacting with each other and not due to the direct benevolence of a divine power ensuring that all would be harmonious in nature, this being a central premise of the dominant ideology of natural theology. Among these interacting species was man, whose effects on the earth did not escape the notice of many of these natural historians.

Despite living in an age of reason, a phrase used somewhat interchangeably with the Enlightenment, these individuals also largely shared a belief in an underlying harmony in nature, an organic holism that lay beyond the scope of a purely empirical and reductionist rationality. For example, as Donald Worster recounts in his pathbreaking history of environmental ideas, *Nature's Economy* (1977), even as Gilbert White fully embraced the utility of nature for the purposes of man, he also described his hometown southwest of London as partially representing an Arcadian dream of reconnecting man to the “vital energies” of the earth. In such manner, these natural historians not only laid down a scientific foundation for future environmentalists but also put forth a mode of thinking about the interrelatedness of nature that would become a staple first of the Romantic movement and in turn of the environmental movement.

Emblematic of this dual role of natural history was the Prussian explorer Alexander von Humboldt, who set out on his five-year expedition to the Americas in 1799. The scientific and narrative volumes that Humboldt produced upon his return to Europe would solidify his status as the era's preeminent man of science, a celebrity whose reputation would not fade into its current near-obscurity until the early twentieth century. Both during and after Humboldt's lifetime, the sheer range of his physical and intellectual explorations into the natural world would inspire legions of post-Enlightenment scientists, very much including Marsh. Yet more inspiring than Humboldt's scientific credentials was the fact that he had made a critical intellectual connection between man and his environment, which in turn resulted from the Prussian explorer's insistence on studying nature as a unified whole. Humboldt's philosophical approach to science

➤ EARLY AMERICAN NATURALISTS

Alexander von Humboldt was fascinated with the United States, even though his time there was limited to a short stay on his way home to Europe from the New World's tropical regions. He would no doubt have relished the opportunity to follow in the footsteps of the pantheon of American naturalists who had made their marks by exploring the virgin North American continent. These included Mark Catesby, John James Audubon, John and William Bartram, François and François-André Michaux, Alexander Wilson, Benjamin Silliman, Thomas Nuttall, and Benjamin Smith Barton. These names should figure prominently in the development of environmental thought. A predominant reason they do not is the fact that scholarship on the early roots of American conservation has generally focused on American Romanticism, a tradition that has emphasized the important roles of such well-known writers as Cooper, Emerson, and Thoreau. Yet it was these North American naturalists who first expressed concern over deforestation and erosion, decried the regional extirpation of species, and celebrated the sublimity and balance of nature.

—Charles Chester

thus constituted a necessary stepping-stone in Marsh's ominous recognition that “man has reacted upon organized and inorganic nature, and thereby modified, if not determined, the material structure of his earthly home.”

In sum, there have been particularly important periods in the growth of the environmental movement. But when we look closely at these periods and at the conservation personae who define them, we find that Marsh, Roosevelt, Pinchot, Muir, and more recent advocates all share a large conceptual debt to an earlier pantheon of explorer-naturalists. Looking at the world with the optimistic skepticism of the Enlightenment along with the ideal of a holistic nature inherent in Romanticism, these scientists endeavored to understand man's role in nature. In doing so, they ultimately enabled their successors to understand that man's effects on nature could be dangerously reciprocal.

—Charles Chester

Early Environmental Groups

The United Kingdom's Manchester Association for the Prevention of Smoke, founded in 1842, arguably lays claim to the status as the earliest environmental group on record. No doubt, tilting at the opaque windmill of industrial air pollution must have seemed a quixotic endeavor, for the group faced opposition not only from industrialists but also from laborers, the majority of whom equated belching smokestacks to domestic comfort. So even though the city did institute air pollution regulations within two years of the association's establishment, the cause and effect are unclear, and, more importantly, substantive remediation of the problem would not come for decades.

The United Kingdom lays claim to a number of other local and national environmental groups founded later in the nineteenth century. Established in 1865, the Commons Preservation Society garnered several victories in its efforts

to protect open spaces (and continues today under the name the Commons, Open Spaces and Footpaths Preservation Society, more commonly known as the Open Spaces Society). There was also the Society for the Protection of Birds (now the Royal SPB), established in 1891. Beyond Great Britain, a small number of British subjects in the colony of Natal responded to the decimation of African game populations by establishing the Natal Game Protection Association in 1883, a move that was followed by the establishment of other such associations in southern African colonies.

During this time period the only other country to substantially contribute to this new social phenomenon—again, a phenomenon that long preceded the label of “environmental group”—was the United States. There were some halting initial steps, most notably the establishment of the first Audubon Society in 1886 by the noted naturalist George Bird Grinnell. The editor of the popular sportsman's magazine *Forest and Stream*, Grinnell had already been involved with the Committee on the Protection of North American Birds of the American Ornithologists' Union (AOU), but this was a scientific society with an institutional structure far different from that of a typical environmental group. But even after its reported membership swelled to 39,000 individuals, the group's activities were largely limited to Grinnell's avid pamphleteering. Due to his many other commitments, he was unable to sustain the organization, and it effectively went defunct in 1888.

One of the reasons Grinnell was so busy was his association with the future president Theodore Roosevelt in establishing the Boone and Crockett Club in 1887. This organization was not what we think of today as an environmental group; rather, it was exactly what it proclaimed to be: an elite club with membership limited to 100. No doubt, with its proximity to power—indeed, with its founder in the position of the country's chief executive officer—the club played an instrumental role in several conservation victories. Although the group would later open itself up to a far broader membership base, its institutional structure would never reflect a typical environmental group with membership open to all. The same can be said of its

➤ FAUNA & FLORA INTERNATIONAL

President Theodore Roosevelt kept up a regular correspondence with a number of British sport hunters, some of whom were also converts to the cause of conservation. One of them, Edward North Buxton, was also an associate member of the Boone and Crockett Club that Roosevelt had helped to found. In 1903 the indefatigable Buxton, a verderer or Royal forest official, was alarmed to hear that the colonial authorities in the Sudan were contemplating the degazetting (reducing a protected site so that it no longer legally or physically exists) of a particularly important game reserve. After a successful letter-writing campaign, Buxton would by the end of that year have organized his influential colleagues into the Society for the Preservation of the Wild Fauna of

the Empire (SPFWE). A notable member of the SPFWE was the governor-general of the Sudan—that is, the person whom the group had swayed in its first campaign—and another was Roosevelt, who became an honorary member in 1904. Over the course of the twentieth century the organization's name would change a number of times. Today, the Fauna & Flora International (FFI) works in more than 60 countries through projects ranging from scientific research and landscape planning to sustainable extraction and land acquisition. As old as the organization is its journal, *Oryx*, an authoritative voice on matters of both conservation advocacy and conservation science.

—Charles Chester

European equivalent, the Society for the Protection of Wild Fauna of the Empire, established in England in 1903 and now known as Fauna and Flora International.

Five years after the Boone and Crockett Club began, a much different organization came to life, one that lays strong claim to the description “archetypal.” During the campaign to designate Yosemite as a national park (the area had been protected by the State of California since 1864, eight years before the establishment of Yellowstone as the world's first national park), conservationists had considered the idea of establishing an organization to promote the cause. Although the designation was achieved in 1890, a new group was not organized until 1892. With the noted conservationist John Muir at its helm the Sierra Club was born, with the tripartite mission of fostering enjoyment of the outdoors, providing information about the Pacific coast's mountain regions, and advocating for their protection. During the twentieth century, the Sierra Club would come to be associated mostly with the latter conservation mission, albeit with a far greater geographic encompassment than the mountain ranges of California and a broader suite of environmental concerns than just that of land protection.

Four years later, in 1896, two Boston socialite women founded the Massachusetts Audubon

Society. On the grounds that fashion trends were responsible for the decimation of bird populations on the continent, they convinced hundreds of women to eschew feathered hats. Mass Audubon, as the organization is now informally called, is thus the oldest extant Audubon Society; it was followed by other state and local chapters and the National Committee of Audubon Societies in 1902 (which became the National Association of Audubon Societies in 1905 and finally the National Audubon Society in 1940).

Taking a broad perspective of these pre-World War I environmental groups, it is notable that the earliest did not set a precedent. Whereas the Manchester Association focused on pollution control, subsequent groups focused almost exclusively on wildlife protection. This remained the case throughout the progressive era, the inter-world war years, the post-World War II boom, and up to what is commonly regarded as the birth of the modern environmental movement: the publication of Rachel Carson's *Silent Spring* in 1962. Yet even as widespread adoption of the term “environmental” largely dates from this time period, the pre-World War I organizations provided copious evidence that civil society could and did play an important role in influencing public policy.

American Transcendentalism and Nature

Transcendentalism was the name given to a collection of individuals and a host of new and old notions about the nature of God, humankind, and the physical world and about the relationships among individuals, society, and the natural environment that circulated through the United States, and particularly New England, in the decades before the American Civil War. With

➤ RALPH WALDO EMERSON

The seer of Transcendentalism was Ralph Waldo Emerson (1803–1882), whose self-assured writing and lectures, with his credo of self-reliance and his emphasis on an original relation to nature, gave voice to the sense of unboundedness that took root in Jacksonian America during the 1830s and 1840s. Emerson was the voice of the future as pioneers were moving westward and before the shadow of slavery and the American Civil War crept across the landscape. Emerson, like so many of those he influenced, spoke for the potential of the individual and the nation. His first important essay, “Nature,” was published in 1836 at the inception of the transcendentalist movement. By the 1850s, the Sage of Concord—whose aphorisms could be attuned to the spiritual seeker and the entrepreneur alike—had become a household name throughout the country and one of America’s first national celebrities.

—Louis Mazzari

kinship to the romantic movement in philosophy and the arts, this movement was difficult to define because its adherents refused definition, and was impossible to categorize because its theorists railed against categories. Insisting on self-reliance, they could barely create a community. Yet as a group they offered a philosophy that was emphatically idealistic rather than materialistic, in contrast with the decidedly commercial culture then flourishing. Attempting to break with traditions of all kinds, the transcendentalists sought a new relation between the individual and society through the study of nature. Suddenly the natural world was seen as the incarnation of God’s perfection, and Transcendentalists sought to catch that scent of perfectibility from every flower in the meadow.

Transcendentalism began as a turning away from religious dogma and church hierarchy and toward the lessons of nature as discovered by each individual through both observation and, importantly, intuition as a more direct and accurate means toward knowledge and wisdom. Many of the Transcendentalists, including Ralph Waldo Emerson, George Ripley, James Freeman Clarke, Convers Francis, and Theodore Parker, had been trained as Unitarian clergy. By the standards of the early nineteenth century, the Unitarians were extremely liberal, rejecting the Calvinist past and the era’s emotional Christian revivalism. Emerson pointedly broke with the authenticity of the “miracles” of the Bible and announced that an individual’s obligation was not to Jesus but rather to his own divinity. This was a big step away from his earlier Unitarian conviction that all knowledge comes by sensory experience and that we learn about God only through ministerial interpretation of His Word in the Bible. Both Ripley and Emerson left their positions as clergy.

Many critics, including most of the traditional clergy, accused Transcendentalists of pantheism and often of atheism. Yet the movement considered nature—which many capitalized, as though spelling the name of God—as the multi-form manifestation of divinity on earth and the source of information not only about the world but also for the way to lead a moral and spiritual life. For the Transcendentalists, nature could be read the way their forefathers had read the Bible for the underlying truths of life it would

reveal to the observant eye. If God emanates through everything and everyone in the world, then study of even the most humble aspects of the world would reveal universal wisdom. Drawing inspiration from transcendentalism, poet Walt Whitman, in his many editions of *Leaves of Grass* (1855), celebrated the universal in the smallest particular.

The rise of Transcendentalism during the 1830s and 1840s coincided with the birth of America's cash economy and the growth of the factory system, when wealth was becoming the preeminent sign of worthiness among more Americans. Reacting against this new capitalist economy, the Transcendentalists sought instead to somehow use nature as a way to measure a soul. The movement quickly grew to encompass politics and philosophy, the arts and literature, individual self-reliance, and social reform.

Boston was the hub of Transcendentalism, Harvard the alma mater of many of its proponents, and Concord, 20 miles (32 kilometers) to the west, its Delphi, home to its most prominent figures, Henry David Thoreau, Bronson Alcott, and Emerson, the movement's oracle. During its flowering, Transcendentalism generated an influential journal of arts and opinion, the *Dial*, edited by Margaret Fuller. It also led to the founding of two renowned but short-lived communal farms in eastern Massachusetts: Brook Farm (1841 to 1847) and Fruitlands (1843 to 1844). Perhaps the most influential literary work to come out of the movement was Henry David Thoreau's *Walden* (1854). The long-term effects of Transcendentalism have been prodigious, even among those who reacted against it. In perhaps the greatest American novel, *Moby Dick* (1851), Herman Melville refutes Transcendentalism's search for truth in nature; a tragic hero sails the world in a futile and destructive attempt to avenge the white whale, whose terrible and unknown nature remains forever inscrutable.

In different and unforeseen ways, Transcendentalism set the stage for much of subsequent American history, politics, art, and culture, from medical reform to the Marlboro Man, from the self-made American businessman to the counterculture of the 1960s, women's rights, and environmentalism.

The National Parks Movement in the United States

Until the 1890s, most Americans considered the notion of preserving wild land in public parks as preposterous. It was the nation's manifest destiny to expand westward and to settle and exploit the wilderness, not to protect forests, mountains, and rivers.

Two giants of the conservation movement: John Muir (right) and Theodore Roosevelt on Glacier Point at Yosemite National Park, 1906. (Library of Congress)

➤ CULTURE AND NATURE IN THE NATIONAL PARKS

While we tend to think of the wilderness contained within national parks as something natural that predates humans, many scholars have recently argued that nature in these parks is also very much a historical and cultural artifact. At Glacier, Grand Canyon, Yosemite, and other parks, early park administrators removed Indian groups who had used natural resources in these areas for centuries. Park officials at the time also exterminated some predators, which unintentionally allowed other species to multiply; extinguished fires started by lightning or Indians; stocked fish; and built roads, campgrounds, and structures. Where nature ends and culture begins is still very much an open question in national park scholarship. A particularly provocative 1995 essay, William Cronon's "The Trouble with Wilderness, or, Getting Back to the Wrong Nature," ignited much debate among environmentalists.

William Cronon, "The Trouble with Wilderness, or, Getting Back to the Wrong Nature," *Environmental History* 1(1) (1996): 7–28.

Despite the emphasis on settlement and utility, some early-nineteenth-century Americans called for wilderness parks. Most famously, the painter George Catlin in 1832 argued for "a *Nation's Park*" on the Great Plains that would contain "man and beast, in all the wild and freshness of their nature's beauty." Others such as the writer Henry David Thoreau, landscape painters, and early tourists in search of views of the sublime, as spectacular wild landscapes were called, attributed aesthetic and spiritual value to wilderness, although they frequently approached wilderness with ambivalence and some fear.

As wild country disappeared after the Civil War, increasingly large numbers of Americans clamored for wilderness preservation. In 1864 Congress set aside Yosemite Valley and the Mariposa Grove of Sequoias as wilderness preserves and then ceded these properties to the state of California to administer for the people in perpetuity. In 1872 Congress established Yellowstone

National Park, which stands as the first true national park in the world.

The U.S. Census Bureau's announcement of the frontier's closure in 1890 and widespread anxiety over the loss of wilderness in the years immediately after further fueled interest in national parks. Tens of thousands of middle- and upper-class tourists, including members of new preservation groups such as the Sierra Club, made outings to wilderness parks, not just to see the sublime but also to hike and camp. Railroad companies, looking for increased traffic and revenues, also supported the national parks and even built hotels and chalets in some of the parks. Between 1890 and 1916 the federal government not only reclaimed Yosemite but also established 11 additional national parks. Some of these, such as Grand Canyon National Park, started out initially as national monuments, which were federal lands with historic, prehistoric, or scientific values that the president of the United States could set aside as prescribed by the Antiquities Act of 1906. During his presidency, Theodore Roosevelt was aggressive in applying the Antiquities Act to preserve wilderness.

While the number of parks grew during the early twentieth century, they were poorly managed and were inadequately funded by Congress. They also faced considerable threat from outside interests. After the 1906 San Francisco earthquake, the city, desperate for a reliable source of fresh water, lobbied for the construction of a dam in the Hetch Hetchy Valley within Yosemite National Park. The proposal to build a dam in the park furthered conflict between conservationists such as Gifford Pinchot of the U.S. Forest Service, who advocated the scientific management of natural resources on public lands, and preservationists such as John Muir, who argued that national park wilderness should be reserved for the physical and spiritual renewal of visitors. Despite the best efforts of Muir and the Sierra Club that he helped found, Congress passed the Raker Act in 1913 that authorized the construction of the Hetch Hetchy dam.

Disappointment with park management coupled with outrage that a dam had desecrated Yosemite National Park led to calls for the creation of a National Park Service that would efficiently administer and protect the parks. In

1916 Congress fulfilled the wishes of park supporters and established the Organic Act establishing the National Park Service. Famously, the act mandated that the new National Park Service “conserve the scenery and the natural and historic objects and the wild life” within the parks and “provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.”

Painted Nature—Nineteenth-Century Landscape

A European or American landscape painter during the nineteenth century received inspiration from sources as diverse as the natural sciences, philosophies of aesthetics, political ideologies, and the literary arts. The pluralism of nineteenth-century art styles, known broadly as Romanticism, Realism, Symbolism, Impressionism, and Post-Impressionism, and other lesser-known communal approaches such as those of the English Pre-Raphaelites and the French Barbizon School, was a result of burgeoning democratic principles as well as socialist trends in politics, the popularization of the sciences in culture, and growing physical and social mobility brought about through developments in technology and transportation.

The stages of stylistic development in landscape painting may be charted through the representational practices and aesthetic debates formed at the intersections of art, science, and

other cultural productions. Paintings of nature reflected human progress as well as an increased understanding of the underlying mechanism of geological action on terrestrial appearance, as can be seen early in the century in the oeuvre of the German Romantic painter Caspar David Friedrich (1774–1840) and later in the works of the American painter Frederick Church (1826–1900). The artist who composed a landscape used varied methods to communicate the experience of viewing broad vistas or random details within universal or local settings. Compositional strategies developed by artists of the seventeenth and eighteenth centuries conveyed spatial depth. These illusionary spaces served as outdoor stages for grand historical events or picturesque idylls. Before the nineteenth century, the landscape was a supporting ground for acts of human heroism or folly, not a topic unto itself.

During the Romantic era, landscape as subject became an expression of emotional depth rather than historical narrative. During this period, a framework of subjectivity based on the doctrines of the eighteenth-century philosophers Edmund Burke, Immanuel Kant, and Jean-Jacques Rousseau placed the observer of a landscape painting within the picture’s ground as a spectator, enabling him or her to experience the immensity of nature. Within their respective cultures, Caspar David Friedrich, the British painter J. M. W. Turner (1775–1851), and the French artist Eugène Delacroix (1798–1863) transformed the way people viewed the landscape by elevating the experiential above the rational (imagination over reason).

Following the progression from eighteenth-century ideals of the picturesque and the sublime, natural scenery became an essential visual motif used within the styles of Romanticism and Realism. Awe-inspiring visions of the Romantic gave way to real landscapes modeled on the close observation of nature. Painters began to reflect on questions other than those concerned with beauty. The appearance of steam engines within the paintings of Turner documented a technological advance that transformed the previously remote areas of Britain, and some art historians credit Turner with addressing the ecological consequences of the rapid urbanization of previously pastoral acreage. Other British

► CASPAR DAVID FRIEDRICH, “THE WRECK OF HOPE”

Caspar David Friedrich was one of the most important German painters in nineteenth-century Europe. Trained as a topographic draftsman, Friedrich expanded upon his own measured understanding of nature through his participation in the rich cultural milieu of Romantic Dresden. This dramatic vista epitomizes the type of spectacular view worthy of attention from a Romantic landscape painter. The subject of the painting, “The Wreck of the Hope,” was an event reported widely in the press throughout northern Europe. Friedrich fabricated the image from these accounts. The eccentric composition anticipates the emphasis on inventive arrangements of surface design that would figure significantly in landscape painting at the end of the nineteenth century.

—Catherine Clinger

(Bildarchiv Preussischer Kulturbesitz/Art Resource, NY)

artists such as John Constable (1776–1837) depicted a new space of human and nature interface, and the Scottish painter William Dyce (1806–1864) situated his views in a way that acknowledged the effects of geological, historical, and astronomical time. Later in the century, the French Pointillist painter Georges Seurat (1859–1891) addressed ideologies of leisure time from a socialist perspective that was closely linked with the psycho-physical theories of Charles Henry, which proposed that the compositional arrangement of vertical, horizontal, and diagonal lines could have a soothing or aggravating effect on the viewer and could thus be used to incite a specific response. Seurat also employed the theory of simultaneous contrast of color proposed by Michel Eugène Chevreul to visually engage the viewer in the optical mixing of primary colors (red, blue, yellow) with secondary hues (orange, green, violet) in a dot pattern.

Whether consciously or unwittingly, the depiction of landscape assisted modern nation-states in their quest to consolidate state power through the presentation of visual evidence of their existence. A prime example of this is the group of American painters known as the Hudson River School who associated the country's unspoiled wilderness with its limitless economic

potential. Some artists, such as the Barbizon painter Théodore Rousseau (1812–1867), actively resisted the appropriation of wilderness for mercantile purposes. Rousseau led protests against the French government's plan to construct roads and initiate monocultural forest practices in the beloved Forest of Fontainebleau.

Later in the nineteenth century, the Impressionist painters modeled their approach to landscape on the Realist plein-air painters who worked in the out-of-doors. Their subject was light. Shapes within nature became indistinct, and color was used to an exaggerated effect. Claude Monet (1840–1926) represented a verdant garden in a way that made one doubt its solidity. It seems that once the light faded from the sky, all would dissolve with it. The measured fields of foreground, middle ground, and background gave way to the flattening of space and the patterning of surface by the end of the nineteenth century. The spatially ambiguous landscapes of post-Impressionist Paul Cézanne (1839–1906) were among the primary sources for Cubist artists in the early twentieth century.

There were also artists who worked independently of these major movements. The fervent renderings of the south of France by the Dutch painter Vincent Van Gogh (1853–1890)

stand on their own as testaments to his unique vision. The theoretical approaches used to codify the range of human emotional responses to landscape, relate modern color theory, or comment on industrial development did not always inform the practice of a nineteenth-century landscape painter. However, the advance of individual rights of certain classes and races in Europe and America did result in greater diversity in the artistic production of landscape painting

that set the stage for the radical artistic projects of the twentieth century.

Society and Culture

Few periods in world history present greater challenges to social and cultural historians than the years between 1750 and 1914. Unquestionably, societies around the world changed in many ways. Slavery and serfdom were virtually abolished, industrialization expanded the middle class and created a new class of salaried factory workers, aristocrats in Europe and Japan lost ancient privileges, and age-old inequalities between men and women were challenged. Change was not the entire story, however. Many long-standing social relationships and attitudes endured, leading many social historians to make continuity rather than change the era's dominant theme. Much the same can be said about cultural history. Revolutionary political, economic, and technological developments in combination with increased literacy and greater contacts among the world's peoples brought inevitable changes, but many values, perceptions, customs, and tastes continued.

In the area of social history, the most extraordinary development between 1750 and 1914 was the nearly complete suppression of legalized slavery. This was extraordinary because slavery had existed for thousands of years, during which time it had evoked little outrage or opposition. It was extraordinary furthermore because the level of slave trading and the number of enslaved individuals both reached historic peaks in the late eighteenth century. The drive for abolition, spearheaded by Protestant religious groups and others inspired by the Enlightenment ideal of universal human rights, began in Europe and British North America in the late eighteenth century. Between 1761 and 1807 Portugal, several New England states, revolutionary France, and Haiti abolished slavery, and in 1807 Great Britain, the world's leading slave-trading nation, and the United States both outlawed the slave trade. During the nineteenth century slavery was abolished throughout Europe, Europe's African and Asian colonies, Latin America, the United States, and Thailand. By the early twentieth century slavery and the slave trade existed only in outlying areas of the Ottoman empire and East Africa.

Slaves were not the only exploited social group to disappear between 1750 and 1914. Serfdom, a centuries-old European socioeconomic system that bound millions of peasants to a particular agricultural estate and required them to perform unpaid labor for their lord, gradually ended as states granted serfs freedom to move, marry whom they wished, pursue professions other than farming, and own land. Serfdom ended in Austrian Habsburg lands in 1781, in Prussia between 1807 and 1816, in Hungary in 1848, and in Russia in 1861 (individually owned serfs) and 1867 (state-owned serfs). Russia's emancipation decrees freed over 40 million individuals, ten times the number of slaves freed by Abraham Lincoln's Emancipation Proclamation.

Another group whose numbers shrunk between 1750 and 1914 consisted of pastoralists, nomads, and foragers who lived outside well-defined state structures and hence in the nineteenth century were lumped together as “tribal peoples.”

Another group whose numbers shrunk between 1750 and 1914 consisted of pastoralists, nomads, and foragers who lived outside well-defined state structures and hence in the nineteenth century were lumped together as “tribal peoples.” Although their numbers in the late eighteenth century were small, no more than 4.8 percent of the world’s population, they occupied large swaths of territory in Asia, the Americas, Africa, and Australia. In the 1800s, however, several factors combined to reduce their numbers further. States and colonial governments expropriated their grazing and hunting lands and redistributed them as private property to farmers, ranchers, and mining and railroad companies. When native peoples resisted, governments responded with the full force of their modernized armies and in a few cases launched extermination campaigns against them. Missionaries introduced doctrines that undermined traditional beliefs, and European settlers introduced new diseases, alcohol, and firearms, which in combination had more deadly results than warfare. By 1900 foragers existed only in a few remote and isolated regions, and most pastoral nomads had been assimilated, removed to reservations, or killed off by wars and disease.

The freeing of slaves and serfs and the organized campaigns to drive pastoralists and foragers off their lands are examples of social changes brought about largely by state action. Other examples abound between 1750 and 1914. In revolutionary France and, over time, most of Europe, legislative change and revolutions stripped nobles of their privileges and diluted their political power by extending voting rights in parliamentary elections to members of the middle and lower classes. In Meiji Japan the country’s leadership took steps to end Japan’s ancient class hierarchies by opening careers to all Japanese irrespective of their social standing and depriving aristocratic samurai of their legal privileges, including their monopoly on military service. The Meiji government also took steps to improve the lot of those at the bottom of society. In 1871 it granted full equality to the *barakumin*, outcasts who since early Tokugawa times had been forced to live in segregated communities and pursue professions as butchers, leather workers, grave diggers, and executioners, all considered to be “unclean” by other Japanese.

In some cases, the results of such state-mandated changes were more symbolic than real. European aristocrats, for example, maintained their wealth and high social standing throughout the nineteenth century and continued to play major roles as army officers, diplomats, and cabinet ministers. In Japan, ex-samurai dominated the small oligarchy that controlled politics during the Meiji period, while the *barakumin* continued to experience discrimination and low wages. Most former slaves and serfs, although technically free, continued to be exploited.

Other major causes of social change between 1750 and 1914 were urbanization and industrialization. Cities grew around the world because of overall population growth and rural to urban migration.

Only in industrializing areas, however, did the makeup of these cities' populations change significantly. Factories created a new class of salaried workers, including women and children, who unlike artisans and craftsmen did not own their tools and equipment and had no ownership stake in the business that employed them. Poverty and squalor marked their lives, especially in the early stages of industrialization. Over time, however, prices for food and manufactured goods fell as a result of productivity gains, while wages increased, partly because of pressures brought to bear by labor unions and socialist political parties. Although hardship and unemployment did not disappear, the new working class in the industrialized West enjoyed rising living standards from the mid-1800s until World War I.

Urbanization and industrialization also contributed to the creation of the modern middle class, or bourgeoisie. The preindustrial bourgeoisie, consisting of artisans and petty shopkeepers at the bottom, professionals (mainly lawyers and physicians) above them, and merchants and financiers at the top, had existed in many parts of the world for centuries. With industrialization, the middle class was first transformed by the entry into its ranks of industrial entrepreneurs, the most successful of whom joined bankers and wealthy retailers at the top of the bourgeoisie social pyramid. Below this extremely wealthy group were families with incomes from small businesses, real estate, government posts, managerial positions, and careers in medicine, academia, engineering, accounting, and the law. The lower middle class, or petty bourgeoisie, consisted of shopkeepers, schoolteachers, minor officials, clerks, and some craftsmen in luxury trades.

The bourgeoisie were responsible for many important political and cultural developments in nineteenth-century Europe and America. They provided support for liberalism and parliamentary rule. They were strong believers in education as a means of social and professional advancement. With wealth and leisure, they provided readership for newspapers and novels, bought tickets to concerts and plays, patronized museums and libraries, went on tours, took vacations at seaside resorts and spas, and avidly participated in new sporting and recreational activities by taking up bicycling, tennis, and golf and attending athletic contests between amateur and professional teams.

The bourgeoisie also supplied much of the energy for the beginnings of modern feminism. Although challenges to discriminatory practices against women took place in many parts of the world, they were strongest in Europe and areas of European settlement, where women were better educated, had more freedom, and benefited from the growing acceptance of the idea of universal human rights.

In the past small numbers of European women had questioned ideas of male superiority and dominance, but only in the late eighteenth century did the idea of equality between the sexes gain wider support. During the French Revolution the Society of

In the past small numbers of European women had questioned ideas of male superiority and dominance, but only in the late eighteenth century did the idea of equality between the sexes gain wider support.

Revolutionary Republican Women demanded equality within marriage, access to public education, greater vocational opportunities, and political rights. In 1792 the English writer Mary Wollstonecraft argued in her widely read *A Vindication of the Rights of Women* that women were the intellectual equals of men but lacked education. Such voices were muted in the conservative atmosphere of the early 1800s, but from the 1850s onward increased schooling for girls, new employment opportunities for women, a declining birthrate (which reduced the time women devoted to child care), and the implications of democratic and socialist ideologies all contributed to feminism's revival. Despite opposition, women made progress. Rewritten civil codes gave married and divorced women greater rights, universities were opened to women, and negative stereotypes about women's abilities and roles in society weakened. The feminists' greatest battle was over political rights. Suffragists fought to gain the vote, but by 1916 only women in Scandinavia, New Zealand, Australia, and the states of Idaho, Utah, Wyoming, and Colorado could vote in national elections. Elsewhere women gained this right after World War I.

Beyond Europe and areas of European settlement, efforts to end discriminatory practices against women were inspired by Western missionaries, colonial officials, and Western-educated intellectuals and political leaders who came to see their society's treatment of women as an impediment to progress and a sign of backwardness. In China, for example, Protestant missionaries played an important role in a campaign to end footbinding, a practice that Westerners and many Chinese came to view as the archsymbol of Chinese women's oppression. In India, missionaries, British officials, and a number of Western-educated male Hindus sought, with some success, to end *sati* (the ritual suicide of widows by burning) and child marriage, allow widow remarriage, and reduce illiteracy. In the Middle East, efforts to educate girls were undertaken by missionaries and, beginning with the rule of Muhammad Ali (r. 1805–1848) in Egypt and the era of the Tanzimat reforms (1839–1876) in the Ottoman empire, also by Egyptian and Ottoman leaders. Such plans were largely unrealized, however, and throughout the region discussions of women's political rights, educational opportunities, and dress were limited mainly to upper-class women in cosmopolitan cities such as Cairo, Beirut, and Istanbul. Only in Japan, where Meiji reformers expanded educational opportunities for girls in the 1870s, did anything close to a feminist movement develop. Feminist writings began to appear in the 1880s, and in 1911 the first feminist organization, Seitosha (Blue Stocking Society), was founded.

Major social and cultural shifts came more slowly to areas that experienced little industrialization. In Latin America a white ruling class of wealthy landowners and merchants dominated society, while the Indian population fell into deeper poverty, especially from the 1870s onward, when white and mestizo landowners expropriated millions of acres of communal Indian lands. Only after the beginnings of industrialization and the influx of European immigrants in the 1880s did a small working class and a modestly growing middle class introduce an element of change to the region's culture and social relationships.

Continuity also characterized social developments in China, where most of the population remained peasants. Artisans and merchants played important economic roles, but with little industrialization, the number of factory workers was minuscule, and the middle class experienced no appreciable growth. China's Confucian-inspired social order, which placed the gentry, or scholar officials, at the top and farmers, artisans, and merchants below them, remained unchallenged despite rebellion, imperialism, and military defeat. Only in the 1890s did reformers begin to question the qualifications of the gentry to lead China and the value of the civil service examination system, which for centuries had produced the country's social and political elite by testing young men on their mastery of Confucianism. In 1906 the government abolished the examinations, a profoundly important step that set the stage for the overthrow of the imperial government itself in 1911.

In Europe's Asian and African colonies, colonial administrators, with the exception of their campaigns against slavery, had little interest in sponsoring or mandating changes in existing social values and hierarchies. To do so, it was believed, would only cause instability and resistance. In India, the British made no effort to weaken the caste system and in fact contributed to its growing rigidity and the heightened caste-consciousness of the Indian people. They did this by collecting and disseminating detailed information on their subjects' caste affiliations and by encouraging the idea that caste was an indicator of intelligence, racial purity, status, and suitability for different occupations. In Africa, the colonial era gave rise to the idea that Africa's population could best be understood as composed of numerous tribes, perceived to be a form of social organization suitable only for hunters and gatherers and primitive agriculturists. Such an assumption downplayed the complexity of precolonial African society, which consisted of a mosaic of lineage groups, age cohorts, clans, villages, chiefdoms, kingdoms, and empires. Tribes, however, made convenient units of administration, and in the system of indirect rule introduced by the British, chiefs, as heads of tribes, were given responsibility for local affairs.

The effects of British rule on the Indian caste system and the previously discussed role of Western missionaries in promoting feminist causes in China and the Middle East are two examples of a phenomenon that increased significantly between 1750 and 1914: cultural interchange. The prime example of this interchange was the diffusion of Euro-American mores, customs, tastes, fashions, and pastimes to many parts of the world. European business suits and top hats became the norm for statesmen and businessmen across much of Asia and parts of Africa. Upper-class women in Meiji Japan continued to wear traditional kimonos in their homes but when attending social events danced to Strauss waltzes in gowns imported from Paris and London and adorned themselves with Western-style jewelry and hats. Western fashion norms also affected many Pacific island women, who adopted Mother Hubbard dresses, wide loose-fitting gowns with long sleeves and a high neck, at the urging of missionaries who had been shocked by the natives' penchant for nudity and perceived sexual promiscuity.

Western influence went well beyond fashion. Western-style churches, office buildings, and train stations became part of the urban landscape in hundreds of colonial cities. In Japan, after Tokyo's Ginza district was destroyed by fire in 1872, it was rebuilt with two- and three-story Georgian-style brick buildings designed by an Irish architect. In larger cities, colonial administrators and native rulers built museums for the display of art and artifacts and theaters and opera halls where Western music was performed. The most famous such building was the Royal Opera House of Cairo, built on orders of Khedive Ismail. Designed by Italian architects, it opened in 1869 with a performance of Giuseppe Verdi's *Rigoletto* and two years later premiered Verdi's even more famous opera, *Aida*. Residents of African and Asian cities could also participate in Western pastimes. The Oriental Cricket Club was founded by Mumbai in 1848. An English-style thoroughbred race course was built in Shanghai in the same year. Baseball was introduced in Japan in 1878 by Japanese students returning from the United States, and by 1900 hundreds of club teams existed. Association football, or soccer, gained enormous popularity in Britain in the late 1800s and simultaneously was introduced in South America and other parts of the world. In the twentieth century this English invention became the world's most popular sport.

Western tastes and cultural norms had little impact at the village level or among the poor and illiterate. Nor were they welcomed universally. In the Middle East, many Muslims viewed Westernization as a dangerous threat to Islam. In Japan, the mania to Westernize that gripped the nation in the 1870s and 1880s had faded by 1900. And in India, an affirmation of Hindu customs and a rejection of further Anglicanization of Indian culture became a central theme for nationalist politicians such as Bal Gangadhar Tilak, who opposed British efforts to raise the age of marriage from 10 to 12 years old because he opposed the colonizers' right

In the Middle East, many Muslims viewed Westernization as a dangerous threat to Islam. In Japan, the mania to Westernize that gripped the nation in the 1870s and 1880s had faded by 1900.

to interfere in Indians' beliefs and customs. Mohandas Gandhi, who asserted the superiority of Indian civilization to that of the West in *Indian Home Rule* (1909) and rejected Western dress in favor of simple peasant's garb, capitalized on these sentiments as he led India to independence between the 1920s and 1947.

Asian and African influences on Western culture between 1750 and 1914 were relatively insignificant. Although explorers' accounts, travel, travel literature, opportunities to study non-Western art in museums, and the emergence of anthropology as an academic discipline provided Europeans and Americans with vast amounts of information about the non-Western world, concrete signs of Afro-Asian influence on Euro-American culture were limited. Eighteenth-century interior designers, furniture makers, landscape architects, and pottery makers went through a period of chinoiserie in which they adopted certain principles of Chinese design in their work. Beginning in the mid-1800s, the opening of Japan to world trade created a flurry of interest in Japanese

painting, textiles, and ceramics. Prominent painters such as Degas, Renoir, Van Gogh, Pissarro, and Monet and the architect Frank Lloyd Wright are all on the list of painters and designers inspired by Japanese design. In the early 1900s Picasso and Matisse were influenced by African art, and the New Orleans musicians who started the musical style that came to be known as jazz were inspired by their African heritage. Outside the world of art and music, however, the cultures of Africa and Asia were subjects of interest but not sources of inspiration or models for the reform of behavior, society, or politics.

■ Introduction: Families

Despite the fundamental importance of families to the structure and functioning of human societies, family history became a subject of inquiry and research among academic historians only in the 1960s and 1970s. Drawing on parish registers (which recorded births, deaths, and marriages), census records (which became increasingly available in the nineteenth century), tax records, probate records, and a variety of literary sources, historians, mostly French and English, were able to shed new light on the “modern European family,” characterized by nuclear rather than extended families, late marriage, a relatively large number of individuals who remained single, and efforts on the part of married couples to control or reduce fertility. Exploding the myth that such “modern” practices resulted from nineteenth-century industrialization and urbanization, these historians showed that such practices were well under way in much of England and northwestern Europe as early as the sixteenth century. Interest in family history was given further impetus by the pioneering work of the French historian Philippe Ariès, whose *L'Enfant et la Vie Familiale sous l'Ancien Régime* (1960; English translation, *Centuries of Childhood*, 1962) argued that the modern concept of childhood emerged from the sixteenth to eighteenth centuries in western Europe, when upper- and middle-class Europeans no longer viewed young people between the ages of 7 and 15 as “miniature adults.” Instead, they came to view these

years as a distinct life stage during which children needed to be nurtured and protected from adult realities such as birth, death, sex, war, and tragedy. Although Ariès's conclusions have been criticized, his imaginative use of cultural evidence in addition to demographic data has had a lasting influence on the field of family history.

Since the 1960s and 1970s family history has flourished but has tended to focus on developments in Europe, especially western Europe and North America, where changes in family life affected and were affected by industrialization, urbanization, migration, secularism, increased literacy, public schooling, feminism, and new political ideologies such as democracy, liberalism, and socialism. A major stimulus to the study of the family was the upsurge of interest in women's history from the 1970s onward. In their studies of courtship, motherhood, divorce, inheritance laws, and views of girlhood, historians trained in women's history inevitably deepened our understanding of the history of families. As a result of recent work in family history, we now more fully understand how family attitudes and practices varied according to class and region and how they changed over time. These changes are amply discussed in the entries in this section.

Whereas family life in nineteenth-century western Europe and North America was marked by both continuity and significant change, throughout eastern Europe, Latin America, Asia, and Africa traditional family-related attitudes

and practices largely persisted. Arranged marriages, extended rather than nuclear families, patriarchy, veneration of ancestors, the acceptance of polygyny, and long-established practices relating to divorce and widowhood continued, even though they began to be questioned and criticized by Western missionaries, colonial administrators, and native social reformers. In Meiji Japan, for example, despite the new regime's support for female education, the growing number of women in the workforce, and the existence of a nascent feminist movement, the official policy of the Meiji reformers was to consign women to their traditional role as head of the household, homemaker, and "good wife and wise mother." Article 5 of the Police Security Regulations of 1890 (renewed in 1900) barred women from joining political organizations, voting, and standing for public office. In China, traditional notions of marriage and the family came under attack during the Taiping Rebellion (1850–1864), whose leaders declared equality between men and women and outlawed concubinage and footbinding in areas they controlled. Campaigns against arranged marriages and footbinding were renewed in the 1890s but had little effect except among small numbers of Western-oriented middle-class families. Similarly, in the Middle East the debate about marriage and the family was initiated by reformers such as the Egyptians Qasim Amin (1863–1908) and Muhammad Abduh (1845–1905), who called for female education and greater equality within marriage. Their works created controversy but resulted in no concrete changes in family law or practice.

The situation was somewhat different in India and Africa. In both regions, not only did traditional practices come under criticism from Western missionaries and native reformers, but colonial administrations had the power to put at least some of their ideas into practice through legislation. In India, for example, the campaign against widow burning (*sati*), which was supported both by Westerners and also Indian reformers such as Rammohun Roy (1774–1833), culminated in the 1829 legislation that outlawed the practice in much of India. In 1856 the Indian government passed the Widow Remarriage Act, which prohibited the practice of enforced widowhood, even for women who were widowed

while still young. At the end of the century reformers took up the issue of child brides after the death of an 11-year-old Bengali girl due to forceful intercourse by her 35-year-old husband in 1889. In 1891 the administration proposed the Age of Consent Act to raise the age of consent and consummation from 10 to 12 years. The legislation was supported by Indian reformers and some Indian women but was bitterly opposed by Hindu nationalists. Although it passed in 1891, it never was seriously implemented, and the marriage of girls as young as 11 is still practiced in parts of early-twenty-first century India.

In colonial Africa missionaries wrestled with how best to deal with the issue of polygyny, the widespread but by no means universal practice of African men having multiple wives. Although some missionaries believed that Africans could remain in polygynous marriages even after becoming Christians, the majority opinion was that monogamy was an indispensable part of converting. Colonial governments supported this majority opinion and established legal codes that favored or enforced monogamous Christian marriage. In Nigeria in 1884 and the Gold Coast in 1908 British authorities established legal registration procedures for Christian marriages and licensed churches to perform state-sanctioned marriage ceremonies that required monogamy. Other regimes levied special taxes on men with more than one wife. As in India, however, missionary efforts and legislation made little headway in changing age-old African attitudes toward families and marriage. In the early twenty-first century the percentage of African men and women in polygynous marriages is only slightly lower than what it had been in the nineteenth century.

African Families in the Early Colonial Era

The sudden military invasion of most of Africa by European countries in the late nineteenth century had a dramatic impact on African family life. Warfare, diseases, the rise of migrant labor, the chaos of war, and the imposition of new colonial legal institutions all affected family relationships. Elder men in many societies lost their ability to control younger men and women as

they had in the past. However, colonial officials sometimes collaborated with prominent African men to restrain the freedom of women and younger male relatives.

Military invasions of Africa between 1870 and 1910 tore apart many African families. Many African men died fighting British troops and their African allies in Kenya, Sierra Leone, Zimbabwe, and elsewhere. French forces in West and Central Africa, Portuguese soldiers in Angola and Mozambique, and the soldiers of Leopold II of Belgium in the Congo not only resulted in combat deaths but also forced many families to flee to safety in remote areas or to European missions. Troop movements also contributed to the spread of diseases such as sleeping sickness. Upheavals such as these also made it possible for some women and younger men to escape the authority of male elders and leading men who lost their lives or their prestige in anticolonial conflicts. Some women in Kenya chose to follow colonial military columns and migrant laborers working on railroad construction and on plantations far from home rather than stay at home. The ambiguous relationship of colonial officials to domestic slavery sometimes allowed families to reunite. In areas such as French West Africa, some slaves took advantage of French efforts to ban servitude to seek out family members. However, in northern Nigeria and elsewhere, other slave owners sought to mask their purchase of slaves by describing their purchases as marriage transactions.

Once the fighting was over and colonial regimes were established, economic changes also affected family life. Migrant labor, especially the need for workers in South African mines, meant that male workers could spend many years away from their home villages and their families. Some families suffered, especially when migrant workers did not send money home. Women in Mozambique took over tasks once dominated by men in agricultural work or sought to move to urban areas to support themselves. Younger men paid in wages often challenged the authority of elders, who lacked access to cash. The wide use of mercenaries and foreign Africans as clerks and traders helped to create new family arrangements. Gabonese traders stationed in Dahomey and Cameroon often married local

women, while Zanzibari, Hausa, and Senegalese troops garrisoned far from home formed families with local women.

Maintaining stability was a goal of many colonial governments, but their policies often disrupted local gender relations. Most governments did little to restrict polygamous marriages, but the chaos of early colonial occupation led many women to flee husbands and ask for divorces in newly formed courts of law. Women in Ghana had some success demanding payments and the dissolution of marriages in court, but authorities often conspired with leading men to make divorce very difficult. In Zambia and Zimbabwe, colonial officials abandoned their earlier willingness to listen to women's concerns and gradually worked to limit women's rights within marriages between 1890 and 1914. While French officials in West Africa and British authorities in Zanzibar and northern Nigeria tried to limit freedoms for slaves, many captives left their defeated masters and tried to reunite with their old families. By 1914 many governments tried to strengthen the power of elder men through new legal codes and discrimination against women and younger men. However, some women used these courts to demand more independence or more resources from husbands and male relatives.

Religious changes had mixed results for African families. Many African societies disdained Christian mission teachings on marriage and the prohibition on premarital sex, but female converts to Christianity often refused to accept polygamous marriages. African-led Zionist churches in South Africa, by contrast, defended polygamy. Violence against women and children was often less acceptable among African converts. Thus, religious changes affected African families in many different ways.

Family Law in Meiji Japan— The Civil Code of 1898

For 30 years following the Tokugawa regime's collapse, Japan's political and intellectual leaders struggled to fashion a legal code that balanced the best features of Western principles and traditional Japanese culture. In the end, the Civil Code of 1898 reflected deep Japanese ambivalence toward modern notions of individual rights and retained the considerable powers that traditional household patriarchs had over their families.

The need for legal reform became apparent shortly after the Meiji Restoration. In the 1850s, Western gunboat diplomacy forced Japanese leaders to accept a series of humiliating treaties that opened Japanese ports to foreign trade, put tariffs under international control, and created a system of extraterritoriality. Foreign nationals accused of crimes in Japan were tried not by Japanese law but rather in consular courts of their home countries. Angered by the Tokugawa

shogun's inability to satisfactorily rebuff Western demands, young Japanese officials overthrew the regime and in 1868 established a new government in Emperor Meiji's name dedicated to the rapid adoption of Western technology and institutions.

The Meiji government needed a new legal system that was both uniform across different regions and social classes in Japan and acceptable to Westerners for the repeal of extraterritoriality. During the 1870s, the Meiji regime replaced formerly semiautonomous feudal domains with centralized administration from Tokyo. The samurai-dominated class structure was also abolished, making Japanese subjects equal before the law. There was still a need for a uniform legal code to replace earlier laws that differed according to domain and class. In 1869, the government charged Eto Shimpei (1834–1874) with drafting a civil code based on French law. In 1880, the Meiji government asked the French lawyer Gustave Emile Boissonade, who had been hired to teach officials in the Japanese Ministry of Justice, for a draft of a civil code. A government committee reviewed the Boissonade project and submitted its own draft, which was approved in 1890 to become effective in 1893.

EXCERPTS FROM THE JAPANESE CIVIL CODE

The following chapter and section divisions are taken from Book IV, "Relatives," of the Japanese Civil Code, adopted in 1898:

"Chapter II: The Head and Members of a House

Section II: Rights and Duties of the Head and Members of a House

Article 746: The head of a house and its members bear the (family) name of such house.

Article 747: The head of a house is bound to support its members.

Article 748: Property acquired by members of a house in their own name constitutes their own separate property.

When it is uncertain whether property belongs to the head or a member of a house it is presumed to be the property of the head of the house.

Article 749: Members of a house may not fix their place(s) of residence against the will of the head of the house.

So long as members of a house are not at the residence(s) designated by the head of the house and contrary to the provisions of the preceding paragraph, the head of the house is relieved from his obligation to support such member(s). . . .

Article 750: The consent of the head of the house is required when a member of a house (desires) to be a party to marriage or adoption. . . ."

Civil Code of Japan, trans. W. J. Sebald (Kobe: J. L. Thompson, 1934), 169–170.

The new civil code created considerable controversy between supporters of Western theories of individual natural rights and traditionalists who believed that maintaining the patriarchal household system was vital to Japan's social stability and cultural survival. The Japanese Diet passed a bill postponing enactment of the civil code and appointed a commission, which rewrote Books Four and Five on family matters. Hozumi Yatsuka (1860–1912) feared that ancestor worship and filial piety, which he believed were at the foundation of Japanese culture, would deteriorate if family authority over individuals was not spelled out in law. Saionji Kimmochi (1849–1940), on the other hand, thought that Japan should conform to international legal standards and that attempts to preserve cultural particularities were misguided.

The Meiji Civil Code embraced individualism in property ownership and personal liability but gave household heads extensive powers over family members. Books One through Three on general provisions, property rights, and contracts were based largely on the earlier French drafts. Book Four on relatives and Book Five on succession, however, were rewritten according to Japanese practice. Individuals were required to be registered as part of an extended family or house. Approval of the house head was required for any member to change households through marriage or adoption. Houses were patriarchal, and wives generally entered the households of their husbands. Women could be house heads if no suitable male heir was available, but upon their marriage headship usually passed to the husband. In cases of divorce, the children usually remained in the father's house. Women could own property, but the house head was designated as the property's manager, although the wife's consent was required for him to sell the property or use it as security for a loan. As these examples show, the house head's authority circumscribed individual rights granted in other parts of the Meiji Civil Code.

The Meiji Civil Code remained in effect until after World War II, when the Allied occupation of Japan prompted a revision that abolished the house head system in 1947.

Hindu Critics of Traditional Indian Marriage—Rammohan Roy and Ishwarchandra Vidyasagar

In the nineteenth century, Rammohan Roy (1773–1833), known as the "father of modern India" and founder of the Vedantist-reformist society Brahmo Samaj, and Ishwarchandra Vidyasagar (1820–1891), a prolific scholar and reformer who worked to secure greater educational access for women and lower-caste Indians, challenged traditional Hindu marriage practices as part of their more general critique of the treatment of Hindu women. Upper-caste Hindu orthodoxy advocated *sati* (in which widows cremated themselves by throwing themselves upon their husbands' funeral pyres or burning themselves) and argued that the practice was sanctioned by Hindu law in the *Vedas*, *Śāstras*, and *Puranas*. Roy, on the other hand, found an altogether different interpretation: *sati* was immoral, and it was either murder or suicide but not a virtuous action. Instead, Roy asserted that a widowed Hindu was supposed to lead a life of asceticism; such a view was provided for in the *Vedas*, the laws of Manu, and the *dharmasāstras*.

The role of Hindu inheritance laws further influenced Roy's stance on *sati* and the treatment of Hindu widows. In his "Brief Remarks Regarding Modern Encroachments on the Ancient Rights of Females, According to the Hindoo Law of Inheritance" (1822), Roy declared that modern Indian civilization was degraded and that the interpretation and application of Hindu law

► ROY ON SATI AND HINDU MARRIAGE, 1822

“It is not from religious prejudices and early impressions only that Hindu widows burn themselves on the piles of their deceased husbands, but also from their witnessing the distress in which widows of the same rank in life are involved, and the insults and slights to which they are daily subjected, that they become in a great measure regardless of existence after the death of their husbands: and this indifference, accompanied with the hope of future reward held out to them, leads them to the horrible act of suicide. These restraints on female inheritance encourage, in a great degree, polygamy, a frequent source of the greatest misery in native families; a grand object of Hindoos being to secure provision for their male offspring, the law, which relieves them from the necessity of giving an equal portion to their wives, removes a principal restraint on the indulgence of their inclinations in respect to the number they marry.”

—Vidyasagar on Hindu (Re)Marriage, 1855

“An adequate idea of the intolerable hardships of early widowhood can be formed by those only

whose daughters, sisters, daughters-in-law, and other female relatives, have been deprived of their husbands during their infancy. How many hundreds of widows, unable to observe the austerities of a *Brahmacharya* life [i.e., celibacy], betake themselves to prostitution and foeticide and thus bring disgrace upon the families of their fathers, mothers, and husbands. If the marriage of widows be allowed, it will remove the insupportable torments of life-long widowhood, diminish the crimes of prostitution and foeticide, and secure all families from disgrace and infamy.”

—John R. Pincince

Raja Rammohan Roy, “Brief Remarks Regarding Modern Encroachments on the Ancient Rights of Females,” in *The Essential Writings of Raja Rammohan Roy*, edited by Bruce Carlisle Robertson (Delhi: Oxford University Press, 1999), 150–151; Isvarchandra Vidyasagar, *Marriage of Hindu Widows* (Calcutta: K. P. Bagchi, 1976), 16–17.

left women, and widows specifically, in a state of destitution. For example, Roy argued that Hindu inheritance laws in Bengal created conditions whereby family members coerced a Hindu widow to join her dead husband on the funeral pyre, thereby removing her from inheritance claims and the commitment of family members to provide her sustenance and support.

According to Roy, women in general were mistreated by men: by their fathers, brothers, husbands, uncles, and religious men. It was no wonder that Hindu widows might choose sati in an act of desperation. In other words, sati was an act of suicide or, worse, murder. Beyond that, Roy was largely silent on the subject of Hindu marriage or widow remarriage. Instead, he continuously stressed an austere life for a Hindu widow. With regard to marriage generally, Roy frequently was critical of polygamy, child marriage, and dowry, especially as practiced among his own upper-caste group of *kulin* Brahmins.

In 1829 the administration of Lord William Bentinck (1774–1839), governor-general during

1828–1835, passed Regulation XVII, which abolished sati. The preamble to the regulation noted that the “revolting” practice violated Hindu laws and instead offered “a life of purity and retirement” for widowed Hindi women. This interpretation was in accordance with the arguments set forth by Roy in his pamphlets. Not until 1856 were Hindu widows accorded the right to remarry, largely due to the endeavors of Ishwar-chandra Vidyasagar.

Like Roy before him, Vidyasagar offered a new interpretation of the texts that formed the compendium of Hindu law and legal commentary on Hindu marriage. Unlike Roy, however, Vidyasagar considered three, rather than two, options available to Hindu widows: remarriage, asceticism or *brahmacharya*, and sati. Whereas Roy supported a widowhood of asceticism, Vidyasagar defended the right of Hindu widows to remarry, most notably in his pamphlet “In Favor of Widow Re-marriage,” first published in 1855. He wrote a number of pamphlets in support of remarriage, spoke and argued on the

subject in public, and even established a society to advance Hindu widow remarriage. He also advanced the cause in offices of the East India Company administration. Eventually Vidyasagar succeeded when the government of Bengal passed the Hindu Widow's Remarriage Act of 1856 (Act XV of 1856). Vidyasagar, as a social reformer, was equally critical of polygamy; child marriage, particularly child widowhood; inheritance laws; and the oppressive conditions of the extended Hindu family.

Family Law in Revolutionary and Napoleonic France

The French Revolution produced profound changes in French society, including family law. During the Revolution, women gained legal equality with men and sought changes to their marital status. The wedding no longer required priests, and after September 1792 only a civil marriage was legal. This required only a mutual pledge signed before a civil authority. Divorce, prohibited by the Church, was legalized and simplified, allowing women to file for divorce after

September 1792. This led to a rush for divorces, and within two years, almost 6,000 divorces were granted in Paris alone. Many unwed couples lived together, which led to many children born out of wedlock. By 1797, the government recorded some 4,000 foundlings in Paris and about 44,000 foundlings in the rest of France.

The Jacobin government (1793–1794) advocated its own family program aimed at breaking up the traditional family, an institution that mirrored the inequalities and injustices of pre-Revolutionary France. The government suppressed the husband's authority, made spouses equal in rights, set up family courts that supplanted patriarchal authority, abolished the law of primogeniture, and ended the right of parents to jail a minor child for disciplinary purposes. The ideas of equality and liberty emancipated sons and daughters from their parents and loosened parenting.

French family law was drastically reversed after the rise of Napoleon Bonaparte, who seized power in November 1799. Napoleon promulgated his famous Civil Code in 1804 and set a new legal basis for the family. The Civil Code's provisions concerning family law and the treatment of women were hotly debated, since they represented a step back from the Revolutionary principles and a resurrection of the customary and religious-based laws of the ancien régime. Napoleon's conservative views on this subject and his emphasis on the value of family played an important role in this. The interests of individual family members were subordinate to the interests of the family unit.

Under Napoleon, marriage was completely secularized and turned into a civil ceremony. The issue of a dowry, which was a prevalent tradition at the time, was resolved through an arrangement between the couple in their marriage contract. The age limits were set at 18 for a man and 15 for a woman, but the government had the right to grant dispensations of age. The marriage could be dissolved only in case of the death of one of the parties or through a lawfully pronounced divorce.

After the Revolution, many felt that morality had declined because it had become too easy to obtain divorces. The Catholic Church opposed divorce and civil marriages in general and lobbied

in favor of restoring its control over the family. However, Napoleon's Civil Code made it more difficult to obtain a divorce. Divorce by mutual consent (Article 233) was retained, but the only legal grounds for divorce were adultery, cruel and excessive punishment of one spouse (Article 232), and "outrageous conduct, ill-usage, or grievous injury" (Article 231). These changes were detrimental to women's status and a retreat from the Revolutionary laws that set simple and equal grounds for divorce for both genders. For example, under the Civil Code, if a wife caught her husband having sex with another woman and shot him, she was considered a murderer. If the situation was reversed, the husband's actions were considered justified, and charges could not be brought against him. Furthermore, a woman's right to divorce was seriously curtailed by the provision that allowed the husband to keep a mistress physically outside the home to avoid the charge of adultery. The wife found guilty of adultery could be imprisoned from three months to two years, depending on the inclination of the husband. Yet a husband convicted of adultery was subject only to a fine of from 100 to 2,000 francs.

The Civil Code also strengthened the authority of fathers and husbands. The wife owed obedience to her husband (Article 213), but the husband pledged protection to the wife. The wife was obliged to live with her husband and to follow him anywhere he decided to reside. She could not plead in her own name, without her husband's permission, in business transactions. However, Article 218 stressed that "if the husband refuses to authorize his wife to plead in her own name, the judge may give her authority." Women's property was managed by a husband or a male relative, and women were treated as if they were minors in legal proceedings.

Fathers had the right to imprison disobedient children for a month up to the age of 16 and for six months thereafter. A father could prevent his son's marriage until he was 26 and his daughter's until she reached 21. Elder children still needed the formal permission of their parents to marry (Articles 148–153, 173–174). To preserve the family, the Civil Code reversed the Revolutionary laws concerning illegitimate children. Individual legitimate children could not be disinherited, but illegitimate children could

inherit only if they were legitimized. The wife was excluded from inheriting any portion of the family property since it was assumed that the husband would make separate arrangements for the maintenance of his spouse.

Family Law in Nineteenth-Century Europe—Marriage, Women's Status, and Child Custody

Just as the nineteenth century saw dramatic changes in perceptions of the family and womanhood, it also was a period of change in the area of family law and women's legal status. The Napoleonic Code, enacted in France in 1804, perhaps exemplifies the period best. The code overturned legislation adopted during the French Revolution that legalized divorce and gave women greater rights in matters pertaining to child custody, property divisions, and alimony. The code also put into law the developing separation between public and private that confined women to the domestic sphere. Under the new laws, which were enacted throughout the Napoleonic empire, women had no legal rights to property and had limited access to divorce. Even this limited access to divorce was reduced further in France, when in 1816 divorce was made illegal, not to be restored until 1884.

In England, unaffected by the Napoleonic Code, laws also were restrictive but were gradually modified over the century as women argued for their rights. Beginning with the 1753 Marriage Act, Parliament began enacting laws

CAROLINE NORTON

Caroline Norton (1808–1877) was a feminist and social reformer in addition to being considered one of the great beauties of her age. Her marriage to lawyer George Norton was a failure, and in 1836 she left her husband. George Norton garnered the income from his wife's books and hid away their children in Scotland and Yorkshire. He refused to grant her a divorce and retained control of their children. Caroline was given supervised visiting rights only after one of the sons was killed in a riding accident. She became an advocate for women's rights within marriage and wrote a number of books and pamphlets on the subject. The following is an excerpt from one of her texts, *English Laws for Women in the Nineteenth Century*:

"I learnt, too, the LAW as to my children—that the right was with the father; that neither my innocence nor his guilt could alter it. . . . The eldest was but six years old, the second four, the youngest two and a half, when we were parted. I wrote, therefore, and petitioned the father and husband in whose power I was, for leave to see them—for

leave to keep them, until they were a little older. Mr. Norton's answer was, that . . . if I wanted to see them, I might have an interview with them at the chambers of his attorney. I refused, and wrote as follows to my solicitor. . . . 'I must decline seeing my children in the manner proposed. I say nothing of the harshness, the inhumanity of telling me I must either see them at the chambers of his solicitor, or not at all; but I say it is not DECENT that the father of those children should force me, their mother, out of the very tenderness I bear them, to visit them at the chambers of the attorney who . . . conducted the proceedings for the intended divorce. . . . Why then, are my children kept from me?—from me, whom even their own witnesses proved to be a careful and devoted mother? Mr. Norton says, the Law gives him my children.'"

affecting marriage. Under this law, legal marriages were to be performed by a clergyman of the Church of England as a public act except for Jews and Quakers. Parental consent was required for anyone under the age of 21. While the law's intent was to prevent sons and daughters of the gentry and aristocracy from marrying without their parents' knowledge, it was a move toward the regulation of marriage by the state. In 1857 Parliament passed the Matrimonial Causes Act. Previously, divorce, while legal, was only obtainable through an act of Parliament, making it impossible for the poor and difficult even for those who could afford it. The 1857 act equalized access to divorce by allowing proceedings to take place in a court of law, but women were encumbered with a heavier burden of proof than men when presenting grounds for divorce. While men were allowed divorce on grounds of adultery, women also had to prove that their husbands had committed incest, had abandoned them, or had been unusually cruel.

In addition, married women's access to their property remained limited. Under the English law of coverture, upon marriage a woman's property was ceded to her husband. Any property or earnings she might acquire while married also belonged to her husband. In the 1800s, however, married women slowly gained greater control over their property as a series of laws concerning married women's property were passed and amended. In 1870 a law was passed that allowed married women to retain control of a limited amount of any earnings as well as any property owned prior to marriage. Finally in 1882, with the Married Women's Property Act, a married woman was allowed full access to her property and wages just as if she were single.

Restrictions also existed regarding women's rights to their children in the cases of divorce or separation. In the early 1800s women had no recourse to custody of their children, as women were considered incapable of rearing a child properly on their own. This began

to change, however, as a new notion of natural, moral motherhood came to bear on issues of child custody. The shift to a more private, domestic concept of the family brought with it the idea that women were naturally more inclined toward a child's welfare than men, and by the late 1830s this shift affected both social thinking and legislation. After a very public divorce from her husband George, Caroline Norton, a novelist and poet, lobbied Parliament for the custody of her young children. In her arguments, Norton argued that women, as mothers, played a critical role in a child's life. After failing to pass in the House of Lords, the bill was eventually passed and made law in 1839 as the Infant Custody Act. Under this law, women, as long as they had not committed adultery, could petition for custody of their children under the age of 7. While important, this law still did not hold men and women as equals in regard to their rights to children, and the laws changed very slowly over the following decades. In 1873 the Custody Acts gave women rights to children under the age of 16, but it was not until 1925 with the Guardianship of Infants Act, nearly a century after Norton first presented her case, that men and women had fully equal rights under the law to their children.

Changes in family law in continental Europe were more limited but resembled those in Britain in some respects. In France, prohibitions against divorce were lifted in 1884, and laws were passed that strengthened women's rights with respect to property and the custody of children. France, like Britain, also passed legislation to protect children from mistreatment by their parents. In Italy, before unification, systems of family law in the various Italian states drew heavily on the Austrian and French civil codes and also were influenced by the teachings of the Roman Catholic Church on matters relating to divorce, for example. After unification, the *codice civile* outlawed divorce but affirmed the secular character of marriage by affirming that all marriages had to be recorded by the state. Fathers were granted authority over the person and property of children, but their use of the property that women brought to the marriage in the form of a dowry was restricted in various ways. In newly united Germany as a result of a law passed in 1875, a civil ceremony became the

exclusive means of entering into matrimony. Efforts to write a civil code for Germany as a whole proved difficult because of divisions between Protestant regions, where divorce had been permitted since the late 1700s, and Catholic areas, where divorce was illegal. When a new civil code was adopted in 1900, divorce was permitted for reasons of adultery, serious criminal conduct, willful desertion, threats of murder, and "grave violations of duties of marriage or by dishonorable or immoral conduct that has caused so grave a disorder" that the marriage could not continue. Otherwise, the code granted husbands authority over children, property, and the person of their spouse. Nowhere on the continent did the autonomy of married women advance as far as in England.

Divorce Law in Europe and the United States

Throughout the eighteenth and nineteenth centuries, various legal codes and practices defined the often narrow conditions for marriage dissolution in Europe and the United States. The limited possible grounds for a divorce, the demand for proof of a spouse's guilt, and the lengthy and complex legal procedures made marriage dissolution difficult and expensive. Moreover, divorce was likely to result in social ostracism in the Christian West. Therefore, it remained a marginal phenomenon into the twentieth century. It did, however, stir heated political and social debates in Europe and the United States, as definitions and codifications of divorce seemed to

► LES DIVORCEUSES—CARICATURES OF THE DIVORCE DEBATE

In 1848, the French illustrated newspaper *Le Charivari* published a series of drawings titled “Les divorceuses” by political satirist Honoré Daumier (1808–1879). During that revolutionary year, new attempts to reinstate divorce in France were brought forward by Minister of Justice Adolphe Crémieux. Radical women’s groups quickly joined in the debate, demanding the right to divorce, while critics across the political spectrum pointed to the moral dangers of women’s social and sexual liberation that would result from the codification of divorce. Daumier’s caricatures ridiculed the politicized women demanding their rights and suggested not only the absurdity of divorce legislation itself but also women’s inability to comprehend national politics.

question the sanctity of marriage and called for a reevaluation of married women’s rights.

Divorce had been available in a number of early modern Protestant states, dating as far back as the era of the Protestant Reformation. A more widespread liberalization of divorce laws, however, only occurred at the turn of the nineteenth century with the rise of the liberal secular state. Throughout the nineteenth century, legislators, journalists, and preachers debated the terms, conditions, and what critics perceived as possibly immoral outcomes of divorce in Europe and the United States. In revolutionary France, as the movement entered its radical phase in the fall of 1792, the Legislative Assembly broke with the Catholic Church’s doctrine that marriage was indissoluble by allowing spouses to divorce legally on the grounds of immorality, cruelty, insanity, conviction for certain crimes, two years’ desertion, emigration, or mutual consent. Based on the principle that marriage was a civil contract, divorce proceedings were cheap and available to all men and women.

The Napoleonic Civil Code (1804), however, redefined the criteria for marriage dissolution in France and by extension those parts of Europe under French rule (including Italy, the Netherlands, Belgium, and parts of Germany). Divorce was made much more difficult because of the strictly defined criteria for at-fault divorce and by the long, complex, and expensive procedures it required. In 1816, following the restoration of the French monarchy, divorce in France was abolished altogether, but the regulations of the civil code were reestablished in 1884.

In Belgium, a civil code introduced in 1831 copied the Napoleonic regulations on divorce, which remained in force until World War I. Similarly, the 1838 Dutch code resembled the Napoleonic code, although divorce by mutual consent could only be obtained after a five-year period of judicial separation. In Italy, divorce was not included in the civil code of 1865, and numerous attempts to introduce it (from 1878 onward) failed, until divorce was finally legalized in 1974. In Prussia, the *Allgemeine Landrecht* (General

State Law) that had been under construction since 1750 was finished in 1794. It defined marriage as dissoluble but, according to the guilt principle, required that one party was responsible for the marital breakdown. This principle of responsibility was maintained and more strictly applied in the *Bürgerliches Gesetzbuch* (Civil Code) that codified divorce in the German empire in 1900. In England, divorce was only attainable by an act of Parliament until the Matrimonial Causes Act was passed in 1857 and allowed for divorce through law courts on the grounds of adultery, incest, cruelty, bigamy, or desertion. In the United States, although the divorce policy remained restrictive and only allowed for at-fault divorce, a complete dissolution of marriage with the possibility to remarry became possible in most states as early as 1800.

Despite the different trajectories of European civil codes and their treatment of divorce, the grounds on which a divorce could be obtained were remarkably similar in all nineteenth-century secular states (in Catholic countries such as Spain, canon law, the internal ecclesiastical law of the Catholic Church, remained in force until well into the twentieth century and made it impossible to dissolve the sacramental marital bond). Desertion for seven years or more, adultery, and cruelty were the most common grounds on which the injured party could seek a divorce. Other grounds included insanity, severe insult, refusal of sexual intercourse, impotency, conviction to a degrading punishment, abandonment of Christianity, and the impossibility to live together. Of these causes, cruelty was most cited by women, whereas divorce because of adultery was usually granted to men.

For adultery, the Napoleonic code had specified that a husband could be granted a divorce on the grounds of simple adultery, whereas a wife could only ask to be separated from an adulterous husband if he housed his mistress. The double standard was upheld in the Victorian Anglo-American world too, as women's adultery was considered more dangerous because it could result in illegitimate offspring. Women's adultery was also seen as anomalous in itself, as women (in contrast to men) were supposedly immune to sexual urges.

The image of the innocent and submissive wife was also prevalent in proceedings based on

allegations of cruelty. Especially in the United States, where the romantic, companionate marriage was most ardently advocated, women's petitions for divorce could be framed as self-defense. This option was less available to European women, as the French legal code stipulated that women were to obey their husbands. In legal practice, this resulted in granting husbands marital authority, similar to the authority they exerted over their children. A man's right to correct his wife was tacitly acknowledged as long as it did not disturb the community's social order.

Childhood

Childhood, at first, seems a static idea that has always had the modern meanings of play, innocence, and learning. However, this ideal of childhood is a relatively recent creation, and ideas of childhood varied throughout time and space. In the Western world, the meanings of childhood underwent many transformations from the eighteenth through the early twentieth centuries. Allowing for class and geographical variations, there were three broadly defined phases: the pre-Enlightenment phase, the Enlightenment phase, and the Industrial phase.

Prior to the Enlightenment era, childhood was not considered a distinct phase of life. Working-class children, including both the urban working class and the rural peasantry, left home to become apprentices or domestic servants and were seen as neither children nor fully independent adults until they married. Furthermore, the primary role of family was patriarchal and often authoritarian, and its purpose was to pass on land and status to offspring, not to nurture or protect them. Some historians argue that children were seen not as a blessing but as an emotional and financial burden on the family until they were old

enough to become economically viable. For example, for working-class families historians point to the high rates of child abandonment while noting that in upper-class households parents and children were separated, as wealthy children were often left to wet nurses, nannies, and tutors. Furthermore, many historians argue that the high infant and child death rates kept parents from investing too much in their children. Finally, prior to the Enlightenment era many Western societies believed that all children were tainted by Original Sin and thus born corrupt.

However, in the eighteenth century many Enlightenment thinkers challenged the idea that children were born sinful and reified childhood as a time of blessed innocence. Rousseau, influenced by earlier thinkers such as John Locke, argued in his famous 1762 book *Émile* that children, unlike adults, were born free from the taint of modern civilization and that their education should nurture that natural innocence instead of focusing on rote memorization. However, Rousseau only advocated this for males and argued that females should be confined to domestic tasks and spheres. Later, Romantics such as William Wordsworth sentimentalized childhood and used children as metaphors of innocence, truth, and beauty in their works. These thinkers contributed to the idea that children should be valued despite their lack of economic worth and that the key to their development was education. Further, they gave parents permission to lavish affection on their children, whereas paternalistic authority and harsh discipline were previously deemed crucial to raising one's offspring. Indeed, motherhood was given a new importance at least among the middle and upper classes, as mothers were seen as the primary teachers of children and as having a great deal of influence on their development for good or ill.

These ideals, in conjunction with lowered rates of infant mortality and an increase in privacy and leisure time for upper and middle classes, served to sanctify childhood as a particularly important and joyous part of life. However, these ideals sometimes clashed with the realities of working-class life during the Industrial era when children were increasingly employed in factories, as their wages were often needed to supplement the family income. Though conditions varied, in some industries,

THE CREATION OF THE BRITISH BOY SCOUTS

For many people, belonging to an international youth group such as the Boy Scouts or Girl Guides was a significant part of their childhood. The Boy Scouts was originally created at the end of the nineteenth century due to concerns about the declining British Empire. In particular, Britain's poor performance in the Boer War raised concerns about the moral and physical fitness of the populace; many connected increased urban living and women's rights to a crisis in British masculinity. In response to these concerns Robert Baden-Powell, a decorated Boer War veteran, created the Boy Scouts in 1908. The Scouts, which focused on morality, physical fitness, obedience to authority, acceptance of one's social station, and staunch patriotism, used outdoor activities and the appropriated and reinterpreted customs of North American indigenous peoples to reawaken young men's "primitive" masculinity. The movement was widely popular among the middle and upper classes. It spread to North America in 1910, and the female branch, the Girl Guides, was created in 1912. Though the underlying messages of the movement have changed, it remains an internationally accepted organization.

—Heather Stanley

particularly the textile industry, the hours and conditions were seen by the upper and middle classes as brutal. Philanthropists and government officials worried about the development of children forced to work from an early age, especially as they had little or no schooling. This led to the creation of child labor laws in many countries, and eventually many Western nation-states made elementary schooling both free and compulsory although attendance was difficult to enforce. As children became more visible, especially as school attendance increased, new standards were set for development and endorsed by a newly professionalized group of experts.

Though it seems at first that the history of childhood from the eighteenth to the twentieth centuries is a story of progress, it should be noted that many families rejected measures such as compulsory education as interfering and paternalistic. For many working-class children, school conditions were the same as work but without remuneration. However, it is clear that

ideas of childhood changed drastically during this time period as children went from being defined as not yet adults to individual entities experiencing a more clearly demarcated time in their life cycle that, in turn, was given much increased importance.

Birth Control

The use and development of birth control in the West during the nineteenth century was shaped by religious beliefs about marriage and sexual behavior that prohibited birth control use, and by views about women's control over their bodies. These views shaped Victorians' understanding of human reproduction and sexuality and the production, distribution, and consumption of various forms or methods of birth control. At the same time, developments in medical science and technology improved the knowledge and control of human reproduction and sexuality. Into this amalgam of ideas have to be added the Victorian social and cultural concerns with propriety and decorum, and similar informal restraints in other societies.

The nineteenth century is notable for the development of contraceptive devices, as well as chemical agents such as spermicide. Also of significance during the century was the publicity that birth control received. In the early decades of the century, broad health reform movements

included family planning as a way to improve women's (and their offsprings') health. Ideas about sexual restraint influenced the practice of birth control, since abstinence was an effective component of any family planning regime.

Not only Christian conservative moralists promoted sexual restraint; health reformers often championed sexual restraint as a requisite for good health. This was a reflection of Victorian ideals that privileged the intellectual and spiritual and disparaged the physical aspects of human life and social behavior. From the 1870s forward, birth control was consistently a major concern of feminists and the women's movement, although various feminists supported it in different ways and to different degrees. Outside the women's movement were groups such as the iconoclastic free lovers, who believed contraception was necessary for women to avoid the trap of marriage.

Various forms of birth control spread throughout western European countries during the century. Family planning through birth control was so effective in France in the first decades of the century that the phrase "French family" came to be a synonym for a family with two children. German medical practitioners and reformers met with success in promoting birth control. In England, the neo-Malthusians promoted and advocated birth control as a way to limit population growth and thereby poverty. Neo-Malthusians based their support of birth control on the arguments of Thomas Robert Malthus that were put forth in his *Essay on Population* (1798)—that the working class should practice "moral restraint" (delaying marriage and practicing abstinence) to ease population growth. One such neo-Malthusian in England was Francis Place, often credited with starting the birth control movement in the English-speaking world in the 1820s. Place recommended methods such as semen-absorbing sponges, as a way for the working class in industrial England to improve their standard of living.

But as working-class communities continued to have the largest families, his entreaties were not effective with that social group. In the United States, neo-Malthusianism was coupled with socialist utopian thought in the publications of British-born Robert Dale Owen (*Moral Physiology* [1830]), and the feminist reformer

and writer Frances “Fanny” Wright. Owen’s book, considered the first American book on birth control, also recommended sponges as well as coitus interruptus and the condom, which became both practical and inexpensive with the vulcanization of rubber in the 1840s. In the United States, the neo-Malthusian Edward B. Foote promoted the use of a cervical diaphragm, another significant technological innovation in the nineteenth century.

The privacy traditionally enshrouding birth control was breached in the nineteenth century by the publication of numerous medical and popular writings. These included works such as Charles Knowlton’s *The Fruits of Philosophy* (1832) and Frederick Hollick’s *The Marriage Guide* (1850), as well as pamphlets and advertisements touting various methods and devices to prevent conception. Opponents of birth control attempted to stem the tide of publicity and diffusion of information by making it illegal to produce, distribute, or consume materials about contraception or abortion, which were legally classified as obscene.

Medical and scientific works on contraception both promoted the latest knowledge about what were believed to be effective methods or devices and criticized unfounded traditional folk methods. An example of this was the work of the German gynecologist Friedrich Adolph Wilde, who had invented the cervical cap. Wilde promoted scientifically confirmed methods of prevention in *Das weibliche Gebär-unvermögen* (1838). In the United States, Charles Knowlton’s *Fruits of Philosophy* (1832) was the first of numerous medical tracts on birth control that promulgated the cervical cap. Throughout Europe, birth control moved into the public sphere; in

Amsterdam, Aletta Jacobs opened a birth control clinic in 1882.

By the end of the of the nineteenth century, urbanization, secularization, and changing views of gender and marriage were leading to the promotion of voluntary motherhood through birth control and laying the groundwork for the birth control movement of the twentieth century.

■ Introduction: Social Change

The entries in this section can be viewed as a series of case studies that illustrate one of the salient features of social history in the period from 1750 to 1914: the existence of tremendous national and regional

differences in the rate and substance of social change.

A transformation of historic proportions occurred in western and central Europe, where a combination of population growth, falling

birthrates, an expansion in state activity, technological innovation, and above all industrialization created a new type of society as different from what had previously existed as agricultural society had been from the hunting and gathering cultures it replaced beginning around 10,000 BCE. Modern Europe's transformation, virtually complete by 1914, included urbanization, growing secularism, higher educational levels, greater equality for women, and new ideas about work and leisure. It also meant a reordering of social groups. The number of farmers and rural laborers declined in both absolute and relative terms; factory workers emerged as a major component of the working class; the middle class grew in numbers, power, and prominence; and older groups such as artisans and landed aristocrats suffered relative decline. All of these changes occurred in an intellectual atmosphere of growing confidence in science and a decline in the intensity of religious belief.

Before 1914, only the United States experienced a social transformation comparable to that of industrialized and urbanized Europe, but it did so under circumstances that made American society unique in some respects. These circumstances included the absence in the American past of an entrenched aristocracy and peasantry; the impact of massive immigration, especially from Europe; the democratizing effects of the Western frontier; and the relatively greater strength of organized religion.

Beginning in the late 1860s, Japan experienced the beginnings of a radical break from its past with the decision of the Meiji regime to embark on a new course of state-directed Westernization. By 1914 aristocratic samurai and daimyo had lost their legal privileges (but only some of their political clout), a nationwide system of public education had been established, and legal equality irrespective of one's social class had been guaranteed by the constitution. Millions of Japanese embraced Western grooming habits, clothing styles, music, sport, and diet. By 1914, however, industrialization was still in its early stages of development, and a majority of Japan's population still consisted of farmers.

Other parts of the world experienced rapid population growth and accelerated urbanization, and inevitably these developments caused

hardship for certain groups and contributed to social tensions. China presents the best example of a society in which the situation of the peasantry deteriorated in the nineteenth century in the face of rising land prices and increased taxes. Some Chinese peasants migrated overseas, and many moved to cities, but these were cities in which the number of factory jobs was minuscule. In 1914 China was still a country of small farmers and a tiny middle class. Until the very end of the period the social and political dominance of the gentry (which in China meant degree holders who had passed the civil service examination at least at the county level) remained unchallenged.

Despite its large cities, India remained a land of small agricultural villages populated by illiterate and generally impoverished peasants whose lives were largely unaffected by British rule. For their part, British colonial officials undertook a small amount of social engineering in their efforts to end *sati*, limit child marriage, and improve the status of widows, but such steps were controversial and difficult to enforce. The British made no effort, however, to tinker with the Indian caste system, the backbone of Indian society. Indeed, certain of their policies might have made caste divisions even more rigid and more central to Indian society than they had been before the British takeover.

Africa, like India, was colonized in the nineteenth century, but the process began in earnest only in the late 1800s, more than a century after the British began to expand their authority in India. The process of colonization brought about massive social disruption to much of Africa and caused severe hardship for farmers and herders who lost their lands or were forced to migrate. Aside from the British and French campaign to suppress slavery, however, colonial officials, who relied heavily on local chiefs to carry out their policies, were uninterested in changing traditional social relationships at the village level.

Latin American society also experienced few fundamental changes in the course of the nineteenth century, despite the uptick in immigration from Europe and Asia in the late 1800s. After independence, few changes in property relations took place, which meant that ethnic and social groups that had dominated colonial

society continued to do so after independence, even though the new governments embraced the concept of equality of all men before the law. Wealth, power, and prestige remained concentrated in the hands of a ruling class of white landowners. The export boom of the late nineteenth century enriched this small minority but brought ruination to many Indian village communities, whose lands were expropriated and whose members were reduced to tenantry and peonage.

The entries that follow all shed light on worldwide social relationships between 1750 and 1914, an era marked not only by revolutionary transformations but also by significant continuities.

—James H. Overfield

The Chinese Gentry in the Late Qing Era

The circumstances of the Chinese gentry changed dramatically with the coming of the Qing dynasty (1644–1912). Long before the Manchus entered China, they were familiar with Chinese institutions. The Qing deeply admired Confucian social and political philosophy but considered their Ming predecessors to be decadent and corrupt. The new rulers were determined to return Chinese government to a mythical Confucian ideal. The examination system remained the primary path for Chinese participation in public service: those who passed earned for themselves and their families entry into an elite class known in the West as the gentry. As had been true for many centuries, any male could rise in station through success in the examinations, but sons of existing gentry had an advantage: their families had both insight into the process and the resources to support the costs. Under the Qing, there was also a category of military gentry, but membership was very small, and the group lacked significant social impact.

There were never sufficient bureaucratic positions open for all aspirants. In theory scholars occupied themselves with governing, but in fact, under the Qing, there were about 1.1 million degree holders competing for 27,000 official positions. Only a small percentage of those holding even the highest designation could expect

public employment. Members of the gentry not holding offices constituted the scholar gentry. Despite the shortage of employment, having a son who passed the examination brought many advantages to families, including reduced taxation and certain legal immunity. In return, the gentry acted as a stabilizing force. They were intermediaries between the government and commoners, sponsored most public construction projects, and provided military assistance when needed.

The Manchurian Qing dynasty had a complex relationship with members of the elite Chinese gentry class primarily because the gentry were not (and indeed never had been) a homogeneous social group. Conflicts between various groups holding gentry status had accelerated as the Ming dynasty spiraled downward. Under the late Ming, fraud in assessing and collecting taxes had involved numerous gentry families in very

THE PRICE OF DISLOYALTY

The Qing emperor Qianlong (r. 1736–1796) understood the importance of preventing potential rivals from gaining too much power. Qianlong doubled the size of China during his reign but watched over the Chinese gentry with care that bordered on paranoia. Qianlong was determined to prevent any disloyalty that might undermine his empire. He punished any suspected breach quickly and harshly. The first example occurred early in his reign when his wife died. Qianlong reverted to a long-abandoned practice of requiring 100 days of mourning. For the first 27 days, government officials were required to wear coarse mourning garb and refrain from pleasure. There was no written prohibition against shaving; in fact, shaving was an innovation introduced (and required) by the Qing. Nevertheless, Qianlong insisted that shaving during a period of mourning was disrespectful. Many of the officials had shaved before they learned of the prohibition, and protested—to no avail—that they had not known of the tradition. Before the end of the controversy, several of the empire's highest officials were beheaded or allowed to commit suicide in lieu of execution for the insult of shaving. Additionally, many of their subordinates were removed from office and banished.

—Carolyn Neel

unsavory activities. Some, particularly the large landholders, had become corrupt and oppressive. Many other members of the scholarly elite were aghast at the state of affairs and saw it as a clear indication that the Mandate of Heaven had passed. But there were also gentry scholars who supported the Ming emperor and followed his heirs into retreat. Those Ming loyalists left the Qing with a deep mistrust of expatriates. Long after the last Ming heir was executed, overseas Chinese were still suspected of treason.

In their treatment of the gentry, the Qing were in many ways more conservative than their Ming predecessors. From the beginning, the Qing sought to preserve Chinese structures, such as the Confucian examination system, as well as their own Manchurian identity. Qing emperors generally monitored the behavior of the gentry carefully and rewarded conformity to traditional Confucian viewpoints. They patronized conservative schools and acted firmly to eliminate the abuse of privileges by gentry families who had profited from coercion and fraud under the Ming. The scholar gentry rewarded the Qing for their protection by providing the rationale and rites that legitimized the Qing as heirs of the Mandate of Heaven. Until late in the dynasty, the Qing prohibited gentry scholars from discussing current politics, encouraging them to spend their time searching for the true meaning of the ancient Confucian writings.

The gentry remained relatively quiet until deteriorating conditions in the nineteenth century stirred both the bureaucracy and gentry scholars to speak out on public issues. Prior to the Opium War, many of the gentry participated in impassioned debates about the problems of increasing drug use in China. Gentry of all levels struggled to preserve Confucian ideology and stability in Chinese society after the disruptions of the Taiping Rebellion and other mid-nineteenth-century disasters. Many came to believe that accepting some elements of European culture was necessary for survival, adopting the motto “Chinese learning as the basis; Western learning for practical use.” By the end of the second war with Britain in 1860, most of the bureaucratic and scholarly gentry passionately supported the Qing dynasty, but their scholarly debate never resulted in a coherent plan.

The European powers had no ambivalence about the role of the gentry, considering them troublesome deterrents to modernity. The Boxer Protocols imposed on China by European states in 1901 suspended the examination system in 45 Chinese cities as punishment to the gentry. In 1905 the crippled Qing abandoned the examination system entirely, but the tradition of scholarly debate about public policies survived.

Chinese Merchants

Chinese merchants have ranged in status from sophisticated entrepreneurs, bankers, and financiers to industrious and intelligent peasants who manage to expand their incomes through handicraft production. It is not possible to develop a blanket description of their activities or their lives. Nevertheless, we can generalize a bit about their wealth, social status, and range of activity. At the apex of the commercial hierarchy stood those families who had achieved both gentry status and wealth in business. Often after a family member had achieved a title through the imperial examination system or as a reward for meritorious service, the family would devote itself to accruing a fortune in business. Qing dynasty officials often forged dynamic relationships and occasionally family ties with these gentry merchants. The idea that merchants were disdained by the Chinese court has been overstated.

It is important not to confuse philosophy with social reality. Confucianism has traditionally held commerce in some disdain, but wealthy merchant families could in fact attain high position. The official Confucian attitude toward merchants was critical, with many Confucian scholars believing that the quest for profits

encouraged competition (and therefore disharmony) and drained resources from the real contributors, particularly the peasant farmers. From this it might appear that commerce was not a vital part of the Chinese economy, but from the Han dynasty until the present, prosperous trading families have been a vital part of the Chinese economy. China's class lines had been permeable for many centuries. If a man (and sadly it was always a male) was bright enough to pass the civil service examinations, any male could aspire to a high-level position. The determining factor was often money; families with the resources to buy a good education for their sons were more likely to attain elevated status. Families whose sons passed the examinations, even if they did not find employment in the bureaucracy, benefitted from lower rates of taxation and certain legal immunities.

Until 1700, China's material culture and standard of living were among the richest in the world. During much of the period following 1750 Chinese internal commerce remained vital, as brokers became essential to moving critical resources across the nation. The Qing dynasty, which generally supported philosophical conservatism, was pragmatic in its dealings with the brokers, bankers, and merchants. Commerce was needed in order to move food and other necessities throughout the empire. In 1763 Yang Yingju, the governor-general of Shaanxi and Gansu, wrote a memorial on grain prices and the internal grain trade (quoted in *Sources of Chinese Tradition*, cited below): "Whenever grain boats from Guangxi came to Guangdong, the merchants were authorized freely to select brokers to whom they could entrust the sale, giving them a reasonable fee for their costs. For a long time, things went this way peacefully."

The Qing accepted responsibility for the state's economic structures. The Finance Ministry was charged with overseeing the functioning of the economic system and the prosperity of the people, yet significantly it had no offices outside the capital. The ministry worked through the court and provincial bureaucracy as well as through personal relationships with powerful merchants and functionaries. In the mid-eighteenth century during the High Qing period, the ministry was very successful in managing

internal trade, but the ministry's ability to impose its will deteriorated with the dynastic decline.

Commerce continued even as the power of the Qing dynasty dwindled. Porcelains and silk were still in high demand, but tea was the most important commercial crop. The tea merchants and brokers thrived, although much of the trade was unofficial, with only about 20 percent of the trade actually reported and taxed by the Qing. One trading family, the Dashengkuai, founded a tea brokerage company in the late seventeenth century that stayed active until the twentieth century. At its height it had many branches throughout China, with 6,000–7,000 employees. In some areas, particularly in Mongolia, where tea consumption was high, other Han Chinese tea brokers were able to become powerful, controlling much of the banking and other financial services. Merchant families also benefited from their associations with other merchant families. One of the characteristics of Chinese merchants was their proclivity for depending on personal relationships in their decision-making processes. Usually family relationships were involved, but voluntary associations, sometimes called fictive kinship, could also be a factor.

After the Opium Wars, the Qing court actively forged relationships with merchant families.

The origins of Chinese Chambers of Commerce in the highly commercialized Lower Yangzi Region are obscure but seem to have been a reaction to increasing foreign influences. After the European incursions, merchants organized themselves to promote Chinese business interests.

By the end of the nineteenth century, the Qing government was actively seeking ties with merchant associations. In one notable instance at the beginning of the twentieth century, the Qing imperial commissioner for commerce, Sheng Xuanhuai, and local elites worked to form the Shanghai Commercial Consultative Association (SCCA). Sheng believed that these groups could help end the divisions between officials and commercial interests, particularly desirable as foreigners became increasingly powerful.

Across China, the number of these associations accelerated as the Qing power declined. During the period 1701–1750 (the High Qing), 18 came into existence; during 1751–1800, 36

came into existence; and between 1801 and 1850, the period of increasing rebellions and foreign encroachments, notably the first Opium War, there were 46 new associations formed. As the Qing deteriorated, between 1851 and 1900 120 new merchant associations formed. During the first 12 years of the twentieth century, there were 62. After the fall of the Qing, many of these merchant associations assumed government functions in attempts, often successful, to maintain order in the face of government dissolution.

Chinese Peasants

Since the twentieth-century revolutions, casual observers have usually characterized Chinese peasants in one or the other of two extremes: as virtuous, diligent yeoman farmers or as vicious, dangerous rebels. The truth, of course, is that they could be either or both. During good economic periods, it was possible for peasant families to accumulate the land and resources to enter into commercial ventures and rise in wealth and position. Unfortunately, the period 1750 through 1914 was a time of hardship for many peasants.

Peasants generally earned their living as subsistence farmers, although some were able to devote the land and time necessary for commercial production. In northern China grains and other dry-land crops were predominant, while rice

was the major crop in the south. Villages in the north differed in social structure from those in the Yangzi delta, largely due to the differing land-ownership patterns. Northern peasants were more likely to own the land that they farmed. Only about 18 percent of peasants in northern China rented land as opposed to 42 percent in the delta, where gentry and merchant families owned many huge estates. As time passed, fewer peasants were able to earn more than necessary to sustain life, but in the areas with the most fertile land, some grew crops—such as tea, mulberry leaves for silkworms, or foodstuffs—for commercial purposes. As was true for peasant farms across the world, Chinese peasant families generally supplemented their income through craft production, weaving cotton or silk, making leather goods, etc. Traditionally, men worked the land while women concentrated on weaving and other indoor tasks, but during periods of low production women also worked in the fields and paddies.

Lineage formed the basis of nearly every peasant village, with all males claiming a common ancestor. The Qing taxed northern villages directly and needed a well-defined organizational structure to deal with the state. They established village councils, which chose men from their own communities to serve as village heads. Councils usually made decisions. Southern village organization was less formal; the state dealt with the southern peasant villages through intermediaries, usually one or more of the wealthy urban landowners. These patterns tended to remain stable; even postrevolutionary organizing met little success in the delta.

Population increase had the most dramatic impact on the lives of peasants. There is a wide variance in population estimates, but the figures used by James Lee and Wang Feng in *One Quarter of Humanity* are well supported. They estimate that the population grew from 225 million in 1750 to 500 million in 1900 even considering the huge numbers who died in famines, rebellions, and wars. The Qianlong emperor doubled the land area of China, but much of the additional ground was minimally suited to agriculture. Improved technology and New World crops such as sweet potatoes, white potatoes, maize, and peanuts sustained the growth for a

time but did not provide a long-term solution. The Qing government's answer to shortages was to urge peasants to simply work harder, bringing about a situation described by Ray Huang as involution: greater effort with lessened returns.

Qing taxation policy worsened the problem. The Chinese monetary system included the use of both silver and copper. Silver was required for payment of taxes and the salaries of officers and bureaucrats; lower-level market transactions were conducted with copper coinage. As silver became rarer, the value ratio between the silver and copper altered from 1:2 to 1:3. Chinese peasants received their income in the devalued copper currency but were required to render taxes in silver. The decline in the value of copper was ruinous to families whose earnings were near subsistence levels; prices escalated as income declined. The deflation in the value of money combined with the scarcity of rice, leaving people vulnerable to famine. One unforeseeable consequence was an increased number of men who were unable to marry. Two factors contributed to the sex imbalance: first, in harsh times parents were much more likely to abandon or kill female infants, so more males lived to reach adulthood. Second, not all females who grew to womanhood were available for marriage. Young women were in high demand as courtesans, concubines, or maids in wealthy families. Their fathers often sold them, but occasionally they left their birth family of their own volition in search of a more secure life. Approximately 20 percent of lower-class males were unable to find wives. Some of these men became urban laborers, some joined roving bands, but nearly all were on the fringes of society, not quite fitting in anywhere. They were a volatile presence.

China has a long history of peasant rebellions. Even before the death of the Qianlong emperor, the Qing faced the White Lotus Rebellion (1796–1804). There were famines in 1810, 1811, 1846, and 1849, resulting in about 45 million deaths. The Jiaqing emperor (r. 1796–1820) faced constant rebellions in one area of China or another, often multiple rebellions at once. From that time onward, emperors dealt with constant famine and rebellion. During the Taiping Rebellion (1850–1871), which cost more than 20 million lives, the Qing dynasty lost two wars

to Europeans. Two El Niño events (1876–1878 and 1888–1902) caused millions more to die from starvation. In 1899 the Yellow River levees broke, destroying more than 2,000 villages. There were further humiliations. In 1895 the Japanese defeated the Qing in a war over control of Korea, and in 1900 European troops put down the Boxer Rebellion, which aimed at expelling foreigners and supporting the Qing. The Qing lost all claim to legitimacy.

Through all of this, despairing and enraged peasants joined in roving armies, smashing village walls and attacking local officials. From the Zhou dynasty forward, widespread famine and rebellion signaled the loss of the mandate to rule. Observers have often credited (or blamed) the intellectual elite for the overthrow of the last ruling dynasty of China, but desperate peasants fueled the rebellions. The downfall of the Qing dynasty in 1911, however, did not better the conditions in which peasants were living.

Japanese Society during the Late Tokugawa Period

The well-ordered feudal society developed by the Tokugawa shogunate in the early seventeenth century began to experience substantial change by the late 1700s and early 1800s. The once-powerful aristocracy made up of daimyo (lords) and samurai (retainers) experienced deep declines, while wealthy merchants and

OSHIO'S REBELLION, 1837

The most sensational demonstration against the late Tokugawa government was led by Oshio Heihachiro (1793–1837), a samurai and former government official who urged villagers around Osaka to rise up and destroy the city. He issued a proclamation in 1837 that declared, “We must first punish the officials who torment the people so cruelly. . . . Then we must execute the haughty and the rich Osaka merchants. Then we must distribute the gold, silver and copper stored in their cellars, and the bales of rice hidden in their storehouses.” Early in 1837 Oshio and several followers led a raid against government offices and set fire to parts of the city, hoping thereby to spark a major peasant revolt. After two days of turmoil, government authorities put down the rebellion. Oshio took his own life, but not before his rebellion had led to the destruction of nearly a quarter of Japan’s key commercial center.

—Daniel A. Métraux

restless tradesmen and peasants grew both in stature and power. The old feudal structure of Japan, which had been built to resist change, was on the verge of collapse in the mid-nineteenth century just at the time that the United States, Great Britain, and other Western nations forced the Tokugawa shogunate to abandon its long-held policy of *sakoku* (isolation from any foreign contact).

For much of the Edo period (1603–1868), Japan was a peaceful and well-ordered society. Although occasional peasant disturbances occurred, especially in the mid-eighteenth century, Japan was capably administered, agriculture flourished, cities grew, and a thriving and a rapidly expanding commercial sector improved standards of living. During two and a half centuries of peace Japan developed a broad network of roads, a growing commercial economy, and the basis of a strong banking and financial system.

Early Tokugawa Japan was a highly organized and stratified society, with the daimyo and samurai at the top and merchants at the bottom. During this peaceful period, samurai put away their swords and became civilian administrators in the daimyo domains (*han*) where they lived.

From generation to generation, samurai were paid fixed salaries, which did not rise with inflation, during the eighteenth and early nineteenth centuries. Tax revenues, often paid in the form of rice, also remained fairly static during much of this period, which meant that many domain governments as well as the shogun’s treasuries were facing shortfalls by the 1830s.

The samurai were facing severe economic and social stress by the early 1800s, worsened by severe cuts in their stipends ordered by cash-strapped domain-based governments. Many samurai families turned to commercial pursuits, often working part-time or full-time in merchants’ or artisans’ shops to supplement their incomes.

Some samurai were forced to pawn their family swords and armor, send their daughters away to work as servants or housekeepers, and even resort to infanticide to avoid financial disaster. In some instances lower-ranking samurai began demanding that leadership positions be given to those of greater talent over those with higher birth.

At the same time, the real income of many merchants and artisans continued to grow. The commercial revolution of the middle and late Tokugawa periods led to the growth of a market economy and the vast expansion of available goods and services. Several merchant families founded lucrative businesses that continue to thrive today including the Mitsui and Sumitomo corporations. These families became very wealthy by building commercial conglomerates that included the production of a variety of goods, increasing numbers of stores, restaurants, inns, and other commercial activities. They also offered massive high-interest loans to the domain governments and to the samurai and daimyo families. Some peasant families, especially large landowners, also prospered as Japan’s growing population required more and more food.

While Japan remained a largely agricultural society, it was also becoming increasingly urban. Regional castle-towns expanded rapidly, but the real growth came in such large cities as Osaka, the nation’s commercial center, and Edo (present-day Tokyo). Edo was little more than a fishing village when the shogunate moved its government there in the early 1600s, but by the mid-nineteenth century it had become one of

the largest urban centers in the world with well over one million residents.

There were, however, real suffering and growing anger among many poorer peasant families. The higher cost of commercial goods, comparatively lower prices for their agricultural products, and occasional famines caused great hardship and considerable unrest. The Tempo famine (1833–1838) caused severe hardships and starvation. Officials in northern Japan in 1836 counted over 100,000 dead, with frequent reports of deserted villages, unburied corpses, and even instances of cannibalism. James McClain cites one diarist who wrote: “Corpses were thrown into wells, and there was a report of a woman who ate her children. The starving and dead were all over. . . . Robbery, burglary, and stealing were the order of the day. . . . The world was without order.”

Many peasants organized themselves into groups to demand help from the government in terms of food relief, temporary postponements in tax collection, and the interdiction of grain shipments to cities. Urban residents, meanwhile, demanded greater shipments of food, tax relief, and an end to price gouging by merchants. When these demands failed to bring desired results, rural and urban riots and uprisings occurred. The more than 400 major disturbances of the 1830s easily outnumbered the riots for the entire seventeenth century. The scale of the disturbances also grew. In 1836 an estimated 100,000 demonstrators caused havoc in Mikawa Province, while nearly 30,000 protesters rose in anger south of Fuji. The large scale of these uprisings and the weak financial condition of the national and domain governments clearly demonstrated the rapid decline in social and government authority throughout Japan.

Another challenge to the established order was the growth of many new religions. New religious movements frequently occurred during times of social turmoil, when especially poorer people turned away from established religions to new millennial religious movements that offered them relief here and now. The most successful of these new religious movements was Tenrikyo (the “Religion of Divine Wisdom”) founded in 1838 by Nakayama Miki (1798–1887) that continues to thrive to this day. Tenri recruited many of

its many members in regions where famine and economic dislocation were greatest in the 1830s and 1840s. Faith, Tenri leaders said, offered mankind the sole means of escape from death and misery in life. Through prayer and faith these new communities of religious believers would overcome the evils of their age and “renew the world” by introducing an earthly paradise where all believers would live in peace and prosperity.

The late Tokugawa era was turbulent, but the quick and nearly bloodless takeover of the government by the leaders of the new imperial army in 1868 and the successful creation of a strong new government precluded a major social uprising that might have otherwise occurred.

Social Change in the Meiji Period

To achieve their goal of turning Japan into an industrial and military power capable of withstanding pressures from the West, leaders of the Meiji Restoration restructured institutions, eliminated old class lines, and opened careers to all classes. By 1914 Japanese society had changed in many ways, but cities were affected more than rural areas, and some groups, notably women, failed to benefit substantially from policies that provided opportunities for political involvement and social mobility to a larger segment of Japanese society.

One of the first acts of the Meiji reformers was the creation of a new peerage, consisting of princes and nobles. Edicts in 1868 abolished the titles of *shogun* (military ruler), *kanpaku* (regent to the emperor), and *sessho* (regent

➤ CHANGES IN DAILY LIFE IN MEIJI JAPAN

In addition to the elimination of old class lines and the opening of many careers to all classes, everyday life was also changed by the influx of Western ideas and influences. The Meiji emperor himself started to wear Western-style military dress, and in 1872 Western dress became mandatory at court and other official functions. Founded in 1873, the prestigious Meiji Sixth Year Society devoted itself to promoting all aspects of Western knowledge. However, the influx of Western ideas did not change the structure of village life or the mode of agricultural production. While industrialization transformed the cities, it only served to widen the contrast between cities and the countryside. For most commoners, daily life remained similar to what it had been in the late Tokugawa years. New foods such as meat and bread were still considered luxuries, and significant changes occurred only after the turn of the century. Susan Hanley, a historian of Tokugawa and Meiji material culture, has argued that because everyday material culture remained the same, people were better able to absorb the shock of other dramatic political, economic, and social changes that occurred during the Meiji period.

—Kirsten Ziomek

to the emperor when a minor). By giving new titles of prince, marquis, count, viscount, and baron to former *daimyo* (feudal lords) and *kuge* (court nobility), members of the old Tokugawa elite were compensated for their loss of political power. They also eradicated the samurai's role as warrior and member of the ruling class. In 1872 the army became truly national, with conscripted commoners becoming its foundation. Other samurai privileges also were eroded. In the 1870s commoners were allowed to acquire surnames (previously used only by *daimyo*, samurai, and some merchants), and in 1876 samurai were prohibited from wearing swords, which were a former mark of social distinction. When the government replaced the *han* (domain) system with prefectures, the samurai also lost their administrative roles. The government stopped paying stipends to the samurai and gave them pensions instead. These changes, which

eradicated the samurai class, led to numerous revolts especially in the southwest, where the Restoration's leaders had originated and where expectations of the new government among the samurai had been highest. Violence culminated in the failed Satsuma Rebellion of 1877, the "last stand of the samurai."

Dissatisfaction with the government's social and political changes was not limited to the samurai. The Freedom and People's Rights Movement, an organization active in the 1870s and 1880s, sought an elected legislature and a commitment to the protection of civil liberties. Although initially comprised of discontented samurai, in the 1880s it gained support from village leaders demanding a role in national politics and a number of elite women who demanded political rights. The government responded to their demands in 1890 by promulgating a constitution, but one that banned women from political activity. The constitution stipulated that the upper house of the Diet was to be appointed by the emperor and that the lower house was to be elected by approximately 450,000 male tax-paying property owners, just over 1 percent of the population.

Most commoners could not vote in the first election, but they benefited from reforms in education and employment. The Ministry of Education, the first ministry created by the new government, set as its goal education for all regardless of wealth and status. In 1873 primary education was mandated for all boys and girls, but the law had to be retracted due to difficulties in securing money and teachers and in convincing rural parents to send their children to school. However, in 1900 compulsory education was once more mandated, this time for six years, and by 1910 the compliance rate had risen to 97.4 percent.

In addition to providing commoners access to education, in 1868 the government abolished hereditary restrictions on occupation and class. Commoners were allowed to ride horses in 1871 and, with the abolition of the domains in 1871, could travel throughout the country (in the past passports were required to travel between domains). In 1871 intermarriage between status groups was allowed. In addition, the subcaste status group, the *burakumin* (hamlet people), was raised to commoner status. Burakumin had been discriminated against because they often

performed jobs considered tainted due to their association with death such as tanning hides, butchering, grave digging, or serving as executioners. During the Tokugawa period they had to wear distinctive clothing and display identification marks to distinguish their status. They had been banned from using certain shrines and temples and could not marry outside their class. Although they legally became commoners in the Meiji period, those identified with the burakumin class continued to experience discrimination throughout much of the twentieth century.

The abolition of the domains also affected the peasantry. In 1873 the taxing system was reformed, with taxes no longer being paid by the daimyo but instead by farmers based on the assessed value of their land. Ownership rights were established, and poor peasants who could not afford to pay their taxes were forced to mortgage their land or become tenant farmers (working on someone else's land in exchange for a portion of the crops). Since tenant farmers did not own their own land, many became economically dependent on the people for whom they labored, often in a cycle of debt and destitution. The rate of tenancy was 25 percent in 1873, but after the new system of land tenure was implemented, the tenancy rate increased to 40 percent by 1893. Many tenant farmers were forced to supplement their incomes by working for extended periods in a city or neighboring town. In many cases, female family members were sent to cities to supplement their family income by working in factories.

By 1890 working-class women, mostly from rural villages, were a major component of the workforce in Japan's developing industrial economy. Young girls from the countryside were often contracted to work in factories for up to five years in exchange for money paid in advance to their cash-strapped families. Most workers in light industry were female; in textiles they made up 60–90 percent. In the late nineteenth century female farm and factory workers produced approximately 40 percent of Japan's gross national product and 60 percent of its products for export. This reflected the preponderance of women workers in the production of silk, one of Japan's most profitable exports.

The Meiji era also saw the emergence of a new middle class, comprised of people who

worked in government, schools, or the new institutions and organizations. Middle-class reformers tackled the social ill of prostitution, tried to reform poor housing conditions of lower-class families, and visited the homes of the lower classes in order to help monitor and cure juvenile crime. Members of this emerging new middle class also helped the government promote its campaigns to reform everyday life, which entailed promoting hygiene in the kitchen and encouraging efficient management of time. This new middle class differed from the old middle class of small business owners and manufacturers, who maintained their importance in city and country alike. The status of merchants also improved during the Meiji period. Previously, the accepted social hierarchy placed samurai at the top, followed by peasants, craftspeople, and lastly merchants, who were looked down upon because of their association with money. After the government reforms, however, the samurai, once at the top, lost their status, while merchants gained more respect for their contributions to society.

It is important to note that although urbanization and industrialization are often viewed as prime symbols of the changes during the Meiji period, most Japanese still labored in the countryside, where there was little evidence of either Westernization or industrialization.

Social Change in India during British Rule

There are some fundamental conditions that need to be noted in regard to social change in India during the British period. First, it is important to note that the British initially appeared in India as merchants of a private company, the East India Company (established in 1600), not as conquerors, and the idea of empire slowly developed because of changing circumstances. In a sense, the British Empire emerged in India without great effort, in large part due to the disintegration of the Mughal empire and the resulting increase of weaker regional powers. Indeed, there was not a sense of India as a coherent entity. India had long been an area and culture (or, more accurately, cluster of cultures) used to absorbing migrant peoples. But much as in Europe, cultures were regionally based.

The British had no intention of staying. Even when the idea of empire did develop, there was no intent of remaining, no attempt at settling (as there had been in North America). The British were there for commerce. Originally they found India fascinating. As they transformed from traders to rulers, they came to view India and Indians as inferior: non-European, non-Christian, nonwhite. The British came to despise Indians and, after the great rebellion of 1857, to fear them. (In 1900 there were about 1,000 British administrators over 300 million Indians and probably 100,000 British totally.) Further, the British drive for profit remained dominant; for example, during famines, foodstuffs were still sent to Britain, and economic change was made for the benefit of the British, not for the welfare of the Indians.

Nevertheless, there were some positive developments as well. It is arguable whether some or all of these changes would have happened anyway, but the influence of British culture is obvious in some key political and social advances. Chief among them was probably the widespread use of the English language, which contributed to unification or nationalism: a sense of oneness superseding or at least linking regional identities. This in turn made possible the freedom movement: leaders in the various regions could

communicate with one another in the same language. It also made it possible for leaders like Nehru and Gandhi to be educated in England in English law, which not only brought the realization that the behavior of the British in India was not in keeping with their ideals but also opened the door to the development of democratic institutions in India. Universities were established in India using English as the medium of instruction. This led to Indian participation in the civil service system and eventually to technological development. Probably most important here is the national parliamentary democracy, clearly patterned after the British system.

The current Indian Administrative Service is an outgrowth of the colonial Indian Civil Service (itself inspired by the traditional civil service of China), which, if reluctantly, came to employ and train Indians. The universities taught English literature and culture, and an Indian literature in English developed (and is flourishing today). The railway system had (and has) a great impact on imbuing regions with a sense of national identity, as did the telegraph. Urbanization contributed to a social fabric incorporating, and in some instances supplanting, caste identities.

Social reform often provided a break with traditional abuses such as suttee (or sati), the burning of widows on the deceased husband's funeral pyre. But this is a complicated matter, sometimes luridly exaggerated in the West. It was a despicable practice but was not as common as perhaps believed or always participated in unwillingly by the widow. Unfortunately it still occurs, albeit illegally and very infrequently. While originally hesitant to interfere in Indian customs, the British outlawed the practice in 1829. But the greater influence in ridding it from acceptance was likely due to the Bengal Renaissance.

The Bengal Renaissance emerged in the British capital of Calcutta (now Kolkata). The Bengal Renaissance included a number of social and artistic movements and organizations. This was a reformist movement influenced by British culture and reacting to Western and Christian criticism (and condemnation) of Indian culture in general and Hinduism in particular. The Bengal Renaissance's cultural and artistic importance

was far-reaching. One outstanding example is a type of painting, a fusion of folk and urban styles, known as Kalighat (after the area around a Hindu temple in Calcutta). Much of the subject matter involves social commentary or observation. It was largely of the nineteenth century but anticipated some twentieth-century international artistic developments aligned with anticolonialism and colonial legacies. It is an outstanding example of synthesis, of Hindu tradition reacting to British influence.

Social change occurred not just because of British rule but often in spite of it. It must be emphasized that as in all cases of imperialism, the ruling culture thought itself superior, often exercising disdain and misunderstanding for the culture and customs of the ruled. The British were no exception, but they did provide more opportunities for development than other imperial rulers. And for the most part the Indians used the opportunities constructively.

European Society during the Old Regime

The historian's difficulty in characterizing the society in Old Regime Europe is compounded by the ambiguity of the term "Old Regime." Although 1789, the year in which the French Revolution began, is universally considered its closing point, there is considerable debate about when it began. This analysis takes 1650 as its starting point, the beginning of an era in which absolutism was the dominant form of government on the continent.

Traditionally, Old Regime Europe has been presented as a "society of orders" that transformed itself into a "society of classes" by the turn of the nineteenth century. More recent studies have challenged this description, arguing that the medieval ideal of three orders—clergy, nobility, and peasantry—obscures the many gradations of position, privilege, wealth, autonomy, poverty, and obligation that made up the fabric of European life. The ideal was developed by medieval clerical scholars and was, even in its inception, an attempt to thwart social change, never truly describing Europe's society.

Despite its deficiencies, the theory of a society governed by orders does provide a beginning point for understanding European life under the Old Regime. Fundamental to the society of orders were the ideas of privilege and hierarchy. Membership in one of the two upper orders, the clergy or the nobility, gave an individual various privileges. These privileges varied depending on the wealth and position of the particular individual and the state in which he lived. The dominant group in the third order, the peasants, were the laborers of eighteenth-century Europe. In eastern Europe most peasants were serfs, tied to the land and to their lord. In western Europe most peasants were freemen but still bore the burdens of a lower social status that kept all but the most prosperous in perpetual debt to the lord—whether a nobleman, a wealthy commoner, or an ecclesiastical establishment (church or monastery)—who governed their land.

In Russia, Prussia, Poland, and territories ruled by the Habsburgs, the privileges of the nobility, the ruling house, and the church remained strong throughout the Old Regime. Attempted agrarian and fiscal reforms under Maria Theresa (d. 1780) and Joseph II (d. 1790) in the Habsburg monarchy were reversed by their successors. Absolutism relied upon an accommodation between the crown and the nobility. This accommodation was achieved in many ways, but central to it was the Crown's support for the nobility's wealth in land. Overall Europe had 3.5 million to 4 million nobles in the eighteenth century, about 3 percent of the total population. Two-thirds of these nobles were located in the states of Poland, Spain, Russia, and Hungary. They were not all wealthy;

➤ JOSEPH II AND AGRARIAN REFORM IN THE HABSBURG MONARCHY

Maria Theresa, empress of the Habsburg monarchy (1740–1765) and coregent (1765–1780) with her son Joseph II, was one of the first European rulers to initiate significant agrarian reform. Her aim was to stimulate the economy by turning serfs into tax-paying freemen with a greater incentive to be efficient farmers. Called the Raab system after the minister who created it, the reforms established a free peasantry with small plots on royal estates. Labor service was commuted to a payment made in cash or kind. Peasants were thus free to spend all their time farming their own plots. Joseph, ruling alone after 1780, sought to expand the reforms to the rest of the monarchy's serfs. Maria Theresa had applied the reforms only in her German-speaking lands in deference to the powerful Hungarian nobles. Joseph made the interest of the state his first priority. Convinced that economic growth was a key to state power, Joseph abolished the personal servitude of serfs, giving them the freedom to move, enter a trade, or marry without their lord's permission. He also established state-licensed judges to settle agrarian disputes.

Furthermore, he surveyed all of the lands of the Habsburg monarchy, assessing taxes based upon the soil's quality. Nine rates were established, and taxes were payable by all landowners, even nobles. To complete his assault on serf labor, Joseph reduced the robot payment (a payment that serfs owed the landowner to replace the unpaid labor that once had been required of them) so that a peasant would owe his lord and the state no more than 30 percent of his gross income. With the land tax set at about 12 percent, this reduced the amount that the lord could collect to about 18 percent. Surprisingly, Joseph's agrarian policies were protested by peasants as well as lords. This was due to the opposition Joseph generated with his reform of the Catholic Church in the Habsburg monarchy and to the difficulty that the population had in understanding the reform legislation. In any event, Joseph's reforms ended abruptly with his death in 1790. His successors reversed the efforts of both Joseph and Maria Theresa in the last decade of the century.

—Annette Chapman-Adisho

in fact, many nobles were scarcely better off than the peasantry but still enjoyed certain symbolic privileges such as the right to wear a sword, sit in the front pew of the village church, and be addressed with deference. The wealthiest nobles were few in number but controlled enormous landholdings and, in eastern Europe and Italy, serfs. For Europe's serfs, the Old Regime meant a life of toil. Landed estates in eastern Europe were divided into two parts: the demesne (the lord's land) and peasant plots. On average, most serfs were required to work three days per week for the lord and more at harvest time. Serfs also paid taxes from the harvests of their own plots to the lord, the state, and the church. Serfs were bound to their lord by a legal arrangement known as personal servitude. They were dependent upon their lord's permission to marry, move, or change their trade. The only real distinction between serfdom and slavery was that the serf had a "legal personality" and could bring suit against his lord in court. The legal justice of the Old Regime favored the lords, however, as they or their agents

had the right to administer justice through the manorial courts.

In western Europe serfdom was essentially abolished by the sixteenth century, and by the eighteenth century land ownership was mixed, with even the restriction on "noble land" only belonging to the nobility long gone. The nobility, the Crown, and the church owned land, as did wealthy urban dwellers whose fortunes had been made in government service, commerce, manufacture, or rents (from their landholdings). Peasants also owned land, and some owned enough that they hired other peasants to work for them. In western Europe, the labor obligations that peasants owed their seigneur were largely converted into dues and fees. Even peasants who owned their land frequently held only nonallodial ownership, which meant that they had the right to work the land and claim its harvest but did not own the land outright. Their children inherited the same rights and obligations. Peasants enjoying nonallodial ownership owed the lord a quitrent, which was an annual tax, in addition

to other taxes. The lord also had monopolies on milling, baking, wine making, and hunting as well as control of local manorial courts.

Despite the hardships of their lives, Europe's peasants under the Old Regime enjoyed a communal organization that was remarkably efficient. Most fully developed in northern Europe, the peasant commune divided common lands as well as some lands held under individual tenure and provided for cooperation with the tasks of plowing, harvesting, and the grazing of animals.

Some Europeans lived outside of the ideal order of three estates. Town dwellers whose freedoms from the manorial system were preserved in charters are one example. Another is Europe's Jewish communities. Kept outside of the society of orders by Christian prejudices, Europe's Jews were restricted in every state by a variety of regulations on where they could live and the trades they could pursue.

Besides the changes that were apparent to contemporaries, society in Old Regime Europe underwent a number of significant changes that were less apparent. First among these was an increase in population; Europe's population increased by about 16 percent from 1700 to 1750 and by another 30 percent from 1750 to 1800. This population increase served as a stimulus to agriculture, with previously marginal land brought into cultivation for cereal crops. Ultimately, however, Europe's agricultural production could not keep up with its population growth, and the end of the century saw greatly increased grain prices. The population increase also expanded poverty in both rural and urban Europe. Increasingly, the poor were not confined to a few categories of unfortunates but instead came to be found among many who were able-bodied rural males and in the prime of their years. This new face of poverty was troubling for contemporaries, who explained it as the result of moral failings. It was first in England that contemporaries began to understand that a changing economy was at least in part responsible for the creation of this new class of laboring poor.

The Middle Class in Industrial Societies

The rise of the middle class during 1750–1914 is closely associated with the Industrial Revolution. Urbanization (and later suburbanization), the pre-eminence of the capitalist economic system, and the separation of the public and private spheres of social life each aided in the definition of the middle class. The middle class came to wield progressively more political, economic, and cultural power, while traditional sources of power such as the nobility and organized churches tended to lose influence in these realms.

The Industrial Revolution began in Britain in the second half of the eighteenth century and spread to Western and Central Europe and the

► THE MIDDLE CLASS AND LIBERALISM IN NINETEENTH-CENTURY EUROPE

Many middle-class individuals in nineteenth-century Europe supported liberalism, one of the first mainstream post-French Revolution political movements that claimed liberty as man's primary right and the basis of modern society. Liberalism represented middle-class interests of personal liberty and individuality opposed to reinvigorated conservative forces in Europe after Napoleon's fall. Liberals stood for middle-class interests in their belief that education and property were the basis of political rights. Early liberalism focused on negative liberty, or individual liberty from coercion by outside authorities (as manifest in the free market, freedom from compulsion by the state, and so on). By the second half of the nineteenth century, liberals focused on positive liberty, a belief that the state must guarantee equality of opportunity through universal education, public health laws, and the like. Liberals succeeded in guaranteeing positive liberties in many European nations in the second half of the nineteenth century but were undone by their own successes. Many workers, exercising their new political rights, affiliated themselves with socialist parties that pushed for further reform. In response, many members of the middle class abandoned liberalism for conservative or nationalist political parties, discrediting liberalism in the decades preceding World War I.

—Andrew Denning

United States in the nineteenth century. By the last two decades of the nineteenth century, Germany and the United States had emerged as the preeminent sites of industrial growth and innovation. In the early twentieth century, industrialization began to take hold in areas of Eastern Europe, Russia, and Japan. In the time period in question, however, the industrial middle class can largely be considered a Western phenomenon.

As a social group, the middle class is notoriously difficult to define. Many choose to define the middle class negatively; that is, the middle class was neither the lower class (working poor) nor the upper class (nobility born into social prestige). The remaining population is a large and heterogeneous group that, when examined carefully, shows as many differences as

commonalities. The middle class may be defined by wealth, education, occupation, or social status, among other possibilities. Thus, there exists no objective definition of the middle class. However, we can generalize in regard to the characteristics of this social grouping in relation to simultaneous industrialization.

The middle class generally drew from white-collar occupations such as commerce, finance, and manufacturing (excluding manual labor). Such vocations were generally small and unorganized in preindustrial societies but grew exponentially as trade and the acquisition and management of capital became the principal economic activities under the capitalist system. Other white-collar professional groups such as doctors, lawyers, and teachers underwent a period of professionalization whereby occupational standards and principles were defined in order to both regulate the quality of such professions and prevent the loss of business to cheap (and often underqualified) imitators on the open market. A large sector of the middle class benefited from the massive expansion of state power and the subsequent growth of bureaucracy to administer the directives of the state.

While socioeconomic definitions offer insight into the groups that made up the middle class, shared cultural attitudes unified a geographically and economically disparate population into what may be called a middle class. The middle class reacted against the conformity and social stratification of preindustrial states by adopting a more individualist philosophy in concert with ideals of personal liberty (especially economic independence) that served as the backbone of industrial capitalism. As a result, middle-class culture valued individuality to such an extent that many critics, including Karl Marx, blamed middle-class individualism for the dissolution of traditional social bonds and for fueling class conflict.

The wealthier members of the middle class, as newcomers to social and cultural prestige by way of their economic prowess, quickly came to imitate the standard-bearers of prestige: the nobility. The growth of consumer culture under the capitalist system allowed affluent middle-class individuals to satisfy their demand for luxury by purchasing the trappings of wealth. While nobles were no longer politically dominant, prominent

members of the middle class still aimed to marry up. That is, by marrying a child to a member of the nobility, middle-class families hoped to improve their own social standing.

Despite newfound social prestige, the middle class struggled to translate economic power into political gain. The example of Great Britain is instructive. In the early nineteenth century, despite middle-class economic prowess, the aristocracy maintained a stranglehold on political power. In 1832, the upper middle class received the right to vote with the passage of the Reform Act, which expanded suffrage to individuals paying large rents. The passage of the 1867 Reform Act lowered rent restrictions and thus extended the franchise to a larger segment of the middle class. Such restrictions were echoed throughout Europe in this era. Middle-class political power was thus predicated not on universal suffrage but rather on securing the vote only for wealthy segments of the middle class (and certainly excluding the workers).

The middle class also placed great emphasis on education. Theoretically, education represented a vehicle of progress, both of technical innovation in the industrial system and as a means of bettering one's social and economic standing within the capitalist meritocracy. In reality, however, schooling helped to perpetuate existing conditions by reinforcing existing social hierarchies within the middle class and further exacerbating the disparity between the upper and lower middle classes. That is, the pursuit of higher education in fine arts disciplines, literature, and philosophy served as a mark of distinction. The aim was to be perceived by one's peers as cultured. In contrast, more technical fields with practical applications were less distinguished and came to be associated with the lower middle class. Such a division was aggravated by the creation of separate schools for technical and vocational training.

In the nineteenth century, middle-class culture showed an intense concern with morality, a manifestation of the importance that the middle class afforded to outward appearance and the visual indicators of wealth and prestige. Victorianism describes the largely middle-class drive in England to curb sexual licentiousness, crime, and cultural depravity in the nineteenth century.

Echoes of Victorianism were to be found among the middle class in other industrialized nations as well.

Middle-class culture also saw a redefinition of gender roles. Whereas preindustrial society often included women as economic actors, the industrial middle class popularized the concept of separate spheres for men and women. The public sphere represented the male realm, while the private sphere (the home) was the female domain, preventing many women from experiencing public life.

The rise of middle-class culture was mirrored by an associated interest in leisure. For the middle class, leisure was often a public pursuit, and middle-class values transformed the urban landscape in Europe and the United States by establishing spaces where leisure time could be enjoyed: parks, museums, zoos, theaters, concert halls, and libraries. The novel gained in popularity due in large part to high levels of literacy and the insatiable cultural appetite of the middle-class readership.

The middle class quickly rose to prominence in this era, translating economic success and increasing social prestige into cultural power. Middle-class culture steadily became a mass culture, as middle-class morals, tastes, and behaviors served to unite disparate groups across the social spectrum.

Middle-Class Values and Self-Help Books

Until the eighteenth century, much European and American nonfiction sought to explain moral, scientific, or social ideas in an exhaustive and intellectual manner. In such treatises, the discipline, its further development, and debates among its scholars were the focus.

➤ SAMUEL SMILES AND SELF-HELP

Samuel Smiles (1812–1904) was not the first person to use the term “self-help,” but he is responsible for its association with a certain type of literature. Smiles is best known for a series of advice books, which included *Self-Help* (1859), *Character* (1871), *Thrift* (1875), *Duty* (1880), and *Life and Labour* (1887). In them, he emphasized that people of modest origins could achieve success through high aspirations and hard work and that individuals’ development was essential to the improvement of society. These views are evident in the opening paragraphs of *Self-Help*, where Smiles writes: “The spirit of self-help is the root of all genuine growth in the individual; and, exhibited in the lives of many, it constitutes the true source of national vigour and strength. Help from without is often enfeebling in its effects, but help from within invariably invigorates.”

Although Smiles was not the first writer of such books, the simplicity of his prose and his inclusion of interesting capsule biographies of famous men made his works quite readable. Each volume was published in Great Britain and the United States.

Samuel Smiles was a best-selling author of inspirational books teaching middle-class values of self-reliance, thrift, and responsibility during the era of the Industrial Revolution in Great Britain. (Library of Congress)

Self-Help alone was translated into several languages (including Japanese and Turkish) and sold more than a quarter million copies internationally. Smiles captured the widespread interest in self-improvement among nineteenth-century Britons and Americans who aspired to the middle class, and *Self-Help* remains an important cultural document to this day.

—Bernadette Lear

However, the long century from the Enlightenment through World War I is notable for the birth of the self-help book, which broadened the typical authorship, audience, and scope of nonfiction. This new genre was particularly important for helping nonacademics to understand and interact with all aspects of the material and spiritual world, and for prioritizing each reader’s personal development over the progress of the given branch of learning. Put another way, self-help books—which were written to be understood and enjoyed by the layperson—emphasized practical how-to aspects of the topic and encouraged the reader to take personal responsibility and pride in his or her own achievement. With this in mind, self-help manuals are usually distinguishable from other works of nonfiction.

In the period 1750–1914, self-help books were primarily a Western phenomenon. Their rise should be understood within broader trends of the era. Throughout the nineteenth century, many traditional social and economic barriers were eroding in the Western world. Not least

important were the expansion of the right to vote, faster communication and travel, the beginning of new and large businesses, compulsory education, improved literacy, lower costs and new printing technologies (making books more affordable and attractive), and increased leisure time. There was a widespread belief in human perfectibility, a possibility that extended from the individual to the community and beyond. For those who could take advantage of these opportunities, a valid question was, how? Unsurprisingly, written self-help guides (which were very portable and could be thumbed through at will) enjoyed a wide readership.

Early works of this type emphasized spiritual development and linked material success to Christian piety. Over time, however, guides began to broach worldly topics more directly. In the late eighteenth and early nineteenth centuries, one of the best-known self-help authors was Benjamin Franklin, whose *Autobiography* he himself felt was “fit to be imitated.” His work provides a good example of the culture’s transition from

religious to secular concerns. In Part 2 of the *Autobiography*, Franklin described how he devised a list of 13 “virtues” to master. The Puritan’s ability to place and maintain limits on oneself clearly underlies many of them: “TEMPERANCE, . . . SILENCE, . . . ORDER, . . . RESOLUTION, . . . FRUGALITY, . . . INDUSTRY, . . . SINCERITY, . . . JUSTICE, . . . MODERATION, . . . CLEANLINESS, . . . TRANQUILITY, . . . CHASTITY, and . . . HUMILITY.” Yet concerns about political fairness, hygiene, financial comfort, and inner peace (as well as some toleration for drinking, “venery,” and other human weaknesses) are also present. Although its contents were not entirely new, Franklin’s book had an extraordinarily wide readership. Samuel Smiles, whose tremendously popular *Self-Help* (1859) gave a catchy name to the genre, emphasized some of the same themes as Franklin, although Smiles drew lessons from a variety of British industrialists in his own era. The virtues that Franklin and Smiles identified more or less characterized self-help manuals written through World War I.

A culture of self-improvement permeated many aspects of nineteenth-century life, and most self-help books demanded that readers act as well as believe. In addition to reading, people often joined lyceums, library associations and book clubs, savings institutions, civic campaigns, gymnasiums, correspondence schools, and other organizations. Mid- and late-nineteenth-century writers produced manuals for all fields of human endeavor. In addition to addressing attitude, intellect, and morals, they dealt with building design and landscaping, business, cooking and homemaking, conversation and etiquette, farming and gardening, music making and other artistic expression, and much more. In fact, some authors (including Smiles) set pen to paper after successes as popular lecturers.

Most guides were written by people who had already achieved something and were giving recommendations to a younger generation or those of a lower social station. Therefore, some scholars believe that self-help books were intended to control perceived inferiors. This line of thought contends that the middle and upper classes felt threatened economically and socially and tried to shape the newly empowered masses to a middle-class worldview. Although this interpretation has

been substantiated, one must not forget that people of all backgrounds have willingly sought and taken advice and have published success guides of their own for others like themselves. For instance, women such as Catharine Beecher offered advice to other women on cooking, house cleaning, and other domestic work. Antebellum students used Benjamin Homer Hall’s *A Collection of College Words and Customs* to initiate themselves into the vocabulary and rituals used on nineteenth-century campuses. Foreign-language newspapers contained articles on finding employment and other topics of interest to new immigrants. Thus, to view self-help books solely as a top-down phenomenon is to misunderstand the reasons behind the ongoing popularity and importance of the genre. As long as humankind has an interest in self-improvement, there will be texts to guide it.

The Working Class and Political Tensions in Early Industrial Britain

Periods of social upheaval, if not caused by warfare or external aggression, often are the result of political change lagging behind economic change. In Britain in the late eighteenth and early nineteenth centuries, remarkable economic

changes were occurring as a result of the Industrial Revolution, including industrialization, urbanization, and new economic relationships. The political structure remained relatively unchanged, however, reflecting the agrarian past of the country. Hence it is hardly surprising that new political movements emerged, demanding a greater share in the country's governance by the disenfranchised.

At the beginning of the nineteenth century, the right to vote was limited mainly to the landed aristocracy. The rise of a manufacturing-based capitalist class, with limited access to the traditional political establishment, and the growth of an industrial working class meant that the majority of the population in Britain was disenfranchised. As such, they had no formal mechanism by which to pursue their economic and political goals.

In these circumstances, antipathy arose between the landed aristocracy and the burgeoning industrial capitalist and middle classes and between the working classes and the landed aristocracy and capitalists. This situation generated political cooperation between the disenfranchised classes that otherwise shared little in terms of their political and economic needs and objectives. The creation of cross-class movements arose to ensure the extension of the franchise as a means of furthering political and economic agendas.

As the size of the industrial working class grew, however, the interests of the workers and the capitalists diverged. Some workers began to form associations with other workers in the same trade to bargain for higher wages and working conditions, although it was the skilled craftsmen who set up most of the lasting associations of working-class men during the period of 1750–1850. Workers united for several reasons: to protect themselves from exploitation, to maintain their living standards to increase their wages, and to provide funds for unemployment and sickness benefits. Unfortunately, the unskilled workforce had little to bargain with; for the most part, they were illiterate and did not earn enough to set aside funds to protect themselves from the ravages of unemployment or sickness. They also lacked political representation to push for legislative solutions.

The high prices accompanying the Napoleonic Wars and the resulting trade embargo caused severe distress for the working class; as early as 1795, Norfolk laborers agreed to organize a petition drive for higher wages. The embryonic workers' movement situated in the Corresponding Societies, however, was crushed by the Corresponding Societies Act of 1799 that made national associations with related branches illegal and by the Combination Acts (1800) that outlawed all trade-union organizations. These laws provided for summary trial and conviction of workers threatening any form of collective action. They were used primarily against unskilled workers, who were now barred from striking for higher wages. Although the Correspondence Societies of the skilled workers were now illegal and could not bargain for higher wages or better conditions, they still were able to provide their members with unemployment insurance and sickness benefits.

Given that unskilled workers were unable to set up trade societies, they had little protection against unemployment and sickness. This made them vulnerable to price changes of necessities and to the whims of the market in terms of their wages. The introduction of labor-saving machinery, the long work day, and low wages became the focus of the ire of the working class. Their primary response was the collective bargaining riot. These machine-breaking riots were a familiar feature of the early stages of the Industrial Revolution and were directed not only at machines but also at all of the property of the capitalists, such as raw materials, finished commodities, and buildings. A sustained form of this illegal action, Luddism, was active primarily from 1811 to 1813. The eighteenth and early nineteenth centuries were punctuated by riots brought about by rising prices of goods, tolls, new machinery, enclosures, press gangs, and so forth. Riots occurred as early as the 1760s and 1770 (e.g., Wilkes Agitation) and continued in the Gordon Riots (1780) and the mobbing of the king (1795 and 1820).

Primarily under the control of the landed aristocracy, the government attempted to destroy this burgeoning working-class movement. From 1760 to 1810, the number of offenses punishable by death increased by 63 and came to include petty theft, destroying machinery, breaking

down fences when commons were enclosed, and the destruction of property. One in every three sentenced to death for these crimes actually was executed. Those whose execution was commuted were transported to Australia and the other prison colonies. Because there was not a police force at the time, the military often were called in to break up these riots. However, the military often created its own destruction, and an attack on the riot by the military had serious political ramifications.

It is essential to note that these riots were spontaneous; participants were not members of organizations that had goals and strategies. The working classes did not have an ideology around which to unite, just their dissatisfaction with their situation, and they had no acceptable form of release for their anger. Champions of the working class at the time included Henry Hunt and William Cobbett; however, they did not have a sufficient understanding of the economic system or the organizational skills to unite these disparate people.

The rise in spontaneous working-class activity provoked additional measures, and the rights of habeas corpus were suspended in 1794, enabling imprisonment without judicial orders and detention without charges. Many strikes occurred in the early years of the nineteenth century in the textile districts, followed by arrests and trials of workers. Textile workers became convinced that strikes were futile without political change leading to parliamentary representation. This led to the issue of parliamentary reform; demonstrations and meetings pressuring for reform were held throughout industrial districts.

One of these meetings was in Manchester in 1819 and resulted in the Peterloo Massacre. Following a charge by the military in an attempt to arrest Henry Hunt at a peaceful political demonstration, 11 people were killed and hundreds injured. This massacre led to further demonstrations, severe criticism of those directly and indirectly responsible, and divisions within the landed aristocracy. The authorities' response to the unrest led to the enactment of what is known as the Six Acts, which were intended to restrict public meetings and demonstrations. The acts enabled judges to impose more severe penalties, strengthened libel and sedition laws, allowed

magistrates to search houses and confiscate weapons, restricted the right of public meeting, and imposed a stamp tax designed to prevent people from reading newspapers published by the radicals by increasing their prices.

With the support of working-class leaders and movements, the industrial capitalists and middle classes obtained the franchise—provided they met the property qualifications—with the Reform Act of 1832. This reform, however, did nothing to ensure the franchise for those without property. In fact, the manner in which the reform was structured led to the loss of the limited representation that the working class had in agricultural districts. The organization of workers into movements, such as the cooperative movement or the National Union of the Working Classes, did not develop seriously until the 1820s and 1830s. Attempts to organize trade unions for unskilled workers did not begin until after the repeal of the Combination Acts in 1824. The organization of workers into a general political movement for parliamentary democratization did not come until the Chartist period (1838–1848). Universal male suffrage independent of property qualifications in Britain was not achieved until 1918, and women gained the right to vote in 1928.

Social Change in Latin America

In the Bourbon period of Spanish America (1713–1821), society was much the same as it had been under the Habsburgs. The most profound difference was the growing influence and discontent

of white Spaniards who had been born in the colonies and were known as Creoles. Peninsular Spaniards (Peninsulares), those born in Spain, were at the apex of the colonial social pyramid and held high-ranking posts in the imperial bureaucracy as well as high offices in the Catholic Church. The officer ranks of the regular Spanish Army on service in the empire were also dominated by the Peninsulares. Creoles, on the other hand, held lesser positions in the bureaucracy or Church and were granted commissions in the colonial militia. In the private sector, the Creoles tended to be large landholders (*hacendados*) but also obtained wealth as wholesale merchants and in a variety of other enterprises. The rest of colonial society was divided in a caste system (*regime de castas*) largely based on race that included mestizos, Africans, and Indians; these classifications were further subdivided into an array of additional racial combinations.

The independence movement that erupted by 1810 in Spanish South America was led largely by the Creole elite who had been greatly influenced by the political theories of the Enlightenment and the examples of the American Revolution and the French Revolution. In contrast, the revolt in Mexico was started by Miguel Hidalgo, a Creole priest who appealed to the masses and was initially opposed by his fellow Creoles. By 1822, Spain's New World Empire consisted only of Cuba and Puerto Rico.

In the immediate aftermath of independence, there was outwardly little societal change in the former Spanish colonies. The most significant change was the departure of most of the Peninsulares, although some remained and became members of the new Creole elite. While the Creoles had united to defeat Spain, this unity was soon bifurcated in the early postindependence period. The Creoles divided into two political groups: Conservatives, who became the defenders of the old order, and Liberals, who favored modernization and a political system that emulated the model of the United States. The removal of Spanish control opened the region to the influx of new ideas from abroad. Intellectual movements including positivism, romanticism, and socialism found adherents in Latin America.

In theory, the newly formed republics did away with the colonial *regime de castas*, as

their constitutions mandated racial equality. In reality, many of the groups retained their distinct racial and cultural identity, which often led to blatant racial discrimination. However, some groups, most notably mestizos, managed to improve their lot and obtained political, social, and economic power. Indians, on the other hand, generally remained at the lower echelons of the social system. In many instances Indians were worse off, because the protective laws from colonial times were rescinded and the Spanish Crown no longer served as their protector. Some Indians escaped abuse by “becoming” mestizo, which meant abandoning their indigenous costumes and customs and speaking Spanish. Until the 1870s, Indians continued to live on communal lands in much the same manner as during the colonial period and even precolonial period. In the 1870s Indians in much of Latin America suffered an assault on their communal way of life, as many of their lands were expropriated as part of economic development schemes. Hence, debt peonage increased, and a type of serfdom evolved that trapped Indians on land owned by whites or mestizos. Another consequence was the emergence of the *patrón* (boss) system that required Indians to show deference to whites, including the removal of hats and the bowing of heads. In many instances, personal decisions, including marriage, had to be approved by the *patrón*. Indigenous peoples were supposed to receive benefits under the *patrón* system including shelter, food, and health care, but when provided these services were often substandard.

Racial lines in nineteenth-century Latin America were not clearly delineated, and attitudes were often contradictory. Some mestizos and mulattos were able to obtain high political office. Examples included Juan José Flores in Ecuador, Vicente Guerrero in Mexico, and Andres Santa Cruz in Bolivia. In Mexico, Benito Juárez, a full-blooded Zapotec Indian, became president. The Creoles often sought the support of mestizos to enhance their political power. However, the introduction of positivism and social Darwinism in the latter half of the nineteenth century intensified racial prejudice. This was mitigated for mestizos, and even pure-blooded Indians, who claimed pure-white blood and in many instances were accepted as such by whites. In some

instances the social status of blacks improved, most notably in Venezuela. However, in most of the newly formed republics, blacks represented a small portion of the population and remained isolated and marginalized.

Another significant societal change brought on by the Wars of Independence involved the status of women. For example, Manuela Sáenz, Simon Bolívar's lover and confidant, served in the revolutionary army and accompanied the liberator on several of his campaigns. Other Creole women participated in the wars by serving as spies and messengers. However, new laws often deprived women of some of the property rights they had enjoyed under Spanish colonial rule. The concept of Marianismo, which celebrated the virtues of the Virgin Mary including tolerance, love, docility, and resignation, became the expected standard for women of high social standing in the new republics of Latin America.

Educational opportunities for women were also limited, but in some countries women were provided with the fundamentals of a primary-level education. Argentina took the lead in improving education and was the most progressive in this area. While some women made some advances, especially in the arts, most remained largely in traditional roles throughout the nineteenth century.

■ Introduction: The End of Slavery and Serfdom

The end of Atlantic slavery and of the serfdom of eastern Europe and Russia was a protracted and complex process with roots in the eighteenth century. The growth of abolitionist sentiment initially among both Protestant Christian and secular enlightenment writers helped people to conceive of the abolition of slavery as a practical possibility and moral desideratum, but in and of itself this sentiment was unable to challenge the entrenched power of slaveholders. Opposition by slaves and serfs themselves put greater strain on the institutions, but with the major exception of the Haitian revolution (1791–1804) seldom did slave or serf revolts lead directly to slavery's or serfdom's end. The massive disruption caused by the French Revolution led to the Haitian revolution, a temporary abolition of slavery on the other French Caribbean islands, and contributed to the abolition of serfdom in those areas of Europe occupied by the French. Although slavery in the French empire was partially restored by Napoleon, the ideal of the universal rights of man,

which spread from the French to other revolutionaries, worked against both slavery and serfdom. The revolutions of the Latin American republics against Spain were usually accompanied or quickly followed by the abolition of slavery in the newly independent nations. The displacement of slavery and serfdom by capitalist systems resting on free wage labor was an underlying process in the end of those systems. Industrial capitalist heartlands like the North of England and New England were also strongholds of abolitionist sentiment. Serfdom was also opposed by centralizing monarchies which saw it as a support of independent landlord power.

The struggles against slavery and serfdom were seen as related. The most protracted struggle against serfdom took place in Russia, and the Russian intelligentsia who campaigned against it copied many of the techniques of the abolitionists, although the popular mobilization practiced by British and American abolitionists was not possible in Russia, with its virtually non-existent public sphere. The most successful piece of

anti-slavery propaganda, the American novelist Harriet Beecher Stowe's *Uncle Tom's Cabin* (1852), was received as an anti-serfdom work and widely read in translation, even though it was banned in Russia until 1857. Russian serfdom, like European serfdom generally, did not find the intellectual defenders that Caribbean and American slavery did, perhaps because serfdom lacked the racial dimension of Atlantic slavery. It was abolished in Russia for private estates in 1861, for state serfs in 1866.

The struggle against slavery took place in two stages, the abolition of the slave trade (mostly meaning the transatlantic trade from Africa) and the abolition of slavery itself. Although the end of Atlantic slavery was mostly peaceful (in fact the peacefulness of the end of British Caribbean slavery in 1834 was used as an argument for abolition), it was marked by two great blood-lettings, one at the beginning of the process, the Haitian revolution, and the other towards its end, the American Civil War (1861–1865). The abolition of slavery in the United States, finalized following Union victory in the Civil War, was not the end of the emancipation process, as slavery was abolished in Cuba, then a Spanish colony, in 1886 and in Brazil in 1888. The ends of Atlantic slavery and Russian serfdom did not mean the ends of unfree labor. Slavery persisted as an institution in China and the Islamic world into the twentieth century, and the legal abolition of slavery throughout the world was not completed until the 1960s. Nineteenth-century Caribbean slavery was replaced by indentured servitude drawing on Indian and Chinese labor, while convict labor in the United States had many of the characteristics of slavery. Despite the legal abolition of slavery in European colonies, imperialists coerced labor from their subjects in systems resembling slavery or sometimes even more harshly, as in the Belgian Congo.

—William E. Burns

Eighteenth-Century Critics of Slavery

Opposition to slavery in eighteenth-century Western society came from two main sources: Protestant Christianity, particularly Quakerism and Evangelicalism, and the Enlightenment. This

opposition was expressed both with idealistic assertions that slavery violated human rights and pragmatic arguments that slavery was economically inefficient.

The Enlightenment's principal impact on the debate was to promote humanitarian arguments on the antislavery side as well as secular proslavery arguments. Most Enlightenment thinkers expressed at least a verbal opposition to chattel slavery. Attacks that highlighted the misery of slaves and the hypocrisy and cruelty of those who exploited them or defended slavery were commonplace in Enlightenment rhetoric. Enlightenment philosophers combined denunciation of slavery's cruelty with the assertion that the institution violated the natural and inalienable rights that slaves, like all people, possessed. This same litany of rights would be asserted in classic Enlightenment-influenced political documents, such as the U.S. Declaration of Independence and the French Declaration of the Rights of Man. However, the Enlightened of Europe never campaigned against slavery as vigorously as they did against evils closer to home, such as religious intolerance or judicial torture.

Although Enlightenment writers frequently attacked the enslavement of Africans in the Atlantic trade, denunciation of slavery was not always correlated with egalitarian ideas about race. The leading philosopher of the Scottish Enlightenment, David Hume (1711–1776), strongly opposed slavery but held extreme views on black intellectual inferiority, comparing blacks who had acquired proficiency in European intellectual disciplines to trained parrots. Hume and other late-eighteenth-century thinkers (particularly in

Eighteenth-century Methodist leader and abolitionist John Wesley. (Hayward Cirkner and Blanche Cirkner, eds., Dictionary of American Portraits, 1967)

➤ JOHN WESLEY ON THE SLAVE'S LIFE, FROM *THOUGHTS UPON SLAVERY*

"When the vessels arrive at their destined port, the Negroes are again exposed naked to the eyes of all that flock together, and the examination of their purchasers. Then they are separated to the plantations of their several masters, to see each other no more. Here you may see mothers hanging over their daughters, bedewing their naked breasts with tears, and daughters clinging to their parents, till the whipper soon obliges them to part. And what can be more wretched than the condition they then enter upon? Banished from their country, from their friends and relations for ever, from every comfort of life, they are reduced to a state scarce anyway preferable to that of beasts of burden. In general, a

few roots, not of the nicest kind, usually yams or potatoes, are their food; and two rags, that neither screen them from the heat of the day, nor the cold of the night, their covering. Their sleep is very short, their labour continual, and frequently above their strength; so that death sets many of them at liberty before they have lived out half their days. . . . Did the Creator intend that the noblest creatures in the visible world should live such a life as this?"

John Wesley, *Thoughts upon Slavery* (1774), 23–24.

Scotland) also emphasized the pragmatic argument against slavery, claiming that it was economically harmful and that slave societies were not as wealthy or productive as ones with free labor. The economist Adam Smith argued in *The Wealth of Nations* (1776) that free laborers were ultimately more efficient than slaves since they required less supervision.

Opponents of slavery on religious grounds were less likely to employ pragmatic arguments; the religious argument against slavery only slowly worked its way into the mainstream of Christianity. Such opposition was strongest in Britain, the world's leading slave-trading nation, and in the British American colonies. The first religious denomination to take a stand against slavery was the Society of Friends (Quakers), which condemned slavery and the slave trade as early as 1727. The first important American abolitionists were the Quakers Anthony Benezet and John Woolman. The second religious critique of slavery came from evangelical revivalists in the English-speaking world, led by the founder of Methodism, John Wesley, who published *Thoughts upon Slavery* in 1774. Wesley and other English evangelical abolitionists, including the lawyer Granville Sharp, were influenced by Benezet. Their work painted a dramatic picture of the cruelty of slavery and, unlike much of the work of the Enlightenment critics, appealed directly to readers' emotions. Sharp, one of the first English antislavery activists, also argued that

slavery could have no recognized existence in English law. Afro-Europeans and former slaves, such as Olaudah Equiano, also attacked slavery based on their personal experiences.

Antislavery Movements in the United States

The U.S. abolitionist movement sought the emancipation of slaves in the South. It was rooted both in the Enlightenment's doctrine of human rights and in evangelical Christianity's attack on the immorality of slavery. The early wave of abolitionism in the eighteenth century peaked between 1784 and 1804, when slavery was abolished in the North and many slaves were manumitted in the South. By 1810 this wave had subsided, and abolitionists endorsed a gradual, compensated emancipation.

In 1816 a group of abolitionists who were concerned about the effects of emancipation on whites formed the American Colonization Society, which favored transporting free blacks to

colonies in Africa. This movement was widely supported by Christian antislavery advocates in the late 1810s and 1820s. In the 1820s several prominent black abolitionists spoke out against colonization and gradual emancipation. In 1829 David Walker, a former slave, published his pamphlet titled *Appeal to the Colored Citizens of the World* in which he denounced colonization and urged slaves to arm themselves and rebel against their masters. Two years later, Nat Turner's rebellion in Virginia caused Southern slaveholders to suspect that Walker's pamphlet had circulated among the slaves.

In January 1831 the abolitionist movement was fortified when William Lloyd Garrison (1805–1879), a Massachusetts-born journalist and social reformer, began publishing the antislavery

journal *The Liberator*. Influenced by evangelical preachers, Garrison denounced slavery as a scandal and a sin, condemned colonization, and urged fellow citizens to embrace "immediate, unconditional, uncompensated emancipation." In 1832 he cofounded the New England Anti-Slavery Society in Boston, which, unlike previous organizations, included both whites and blacks.

Other abolitionist groups were soon established in New York City, upstate New York, and Ohio. In 1833, 62 representatives from these groups gathered in Philadelphia and founded the American Anti-Slavery Society (the first national organization), which sought absolute, immediate emancipation. One year later the society started publishing a nationally circulated periodical, *The Emancipator*, that became part of a flood of antislavery literature. Members were urged to employ "moral suasion" and spread antislavery literature to convince Northerners to support abolition. Membership in the new organization mushroomed. By 1838 there were 1,350 chapters with more than 250,000 members.

As early as 1833, abolitionists confronted mobs of hostile Northerners who considered the call for immediate emancipation socially disruptive and revolutionary. Antiabolitionist violence increased in 1835, after the American Anti-Slavery Society launched a postal campaign to spread abolitionist literature. Violence peaked in 1837 when a mob killed antislavery newspaper editor Elijah P. Lovejoy in Alton, Illinois. Meanwhile, angry Southerners pressed the president and Congress to censor abolitionist literature. In response, Congress adopted a series of resolutions between 1836 and 1840 collectively known as the gag rule, which stipulated that Congress would not consider antislavery petitions. Abolitionists continued to flood Congress with thousands of petitions, however, and in 1844 the gag rule was repealed.

After 1835, ideological disagreements splintered the American Anti-Slavery Society. Garrison and his supporters sought involvement in multiple reform movements. They encouraged women to join the society and started to merge abolitionism with the battle for women's rights. In contrast, anti-Garrisonians considered women's rights unnecessary, believing that the United States (apart from the flaw of slavery)

was fundamentally sound. Both sides also disagreed over the need for political action. Garrisonians were committed to campaigns of moral suasion rather than direct political action, while anti-Garrisonians envisioned a political party based on abolitionist principles. A group of anti-Garrisonians launched the Liberty Party in 1840 to challenge the Democratic and Whig parties. The Liberty Party received only modest support, and in 1848 it joined with other groups at a meeting in Buffalo, New York, to found the Free Soil Party.

Such divisions ultimately led anti-Garrisonians to abandon the American Anti-Slavery Society at its 1840 meeting. Most of them joined the American and Foreign Anti-Slavery Society, founded by Arthur and Lewis Tappan. Meanwhile, Garrisonians retained control over the original American Anti-Slavery Society. This split caused the abolitionist movement to lose its unity and momentum. Women became increasingly convinced that they needed their own organization to fight effectively for their rights. In 1848 a group of female abolitionists, headed by Elizabeth Cady Stanton, gathered at Seneca Falls, New York, and started the first U.S. women's rights movement. Meanwhile, in the 1840s, some African American abolitionists determined that their goals did not fully coincide with those of the American Anti-Slavery Society, and others came to believe that white abolitionists tended to patronize them. Some resigned from the society and became active in the National Negro Convention Movement to fight discrimination and promote the advancement of free people of color. Some of the most famous African American abolitionists included Frederick Douglass, Harriet Tubman, and Sojourner Truth, who toured Northern cities and delivered lectures on their experiences in slavery.

In 1850 the Fugitive Slave Act (requiring Northerners to help slave owners capture escaped slaves) convinced many Garrisonians to abandon moral suasion and support active slave resistance. Most abolitionists supported the militant strategies of activists such as John Brown, who famously led a raid in 1859 against the arsenal at Harper's Ferry, Virginia. With the secession of Southern states in 1861, abolitionists sided with the Union. However, they denounced

➤ AN ABOLITIONIST MANIFESTO

The following excerpts are from the Declaration of Sentiments, adopted by the founders of the American Anti-Slavery Society in 1833.

"We believe and affirm . . .

That the slaves ought instantly to be set free, and brought under the protection of law:

We further believe and affirm—that all persons of color, who possess the qualifications which are demanded of others, ought to be admitted forthwith to the enjoyment of the same privileges, and the exercise of the same prerogatives, as others; and that the paths of preferment, of wealth and of intelligence, should be opened as widely to them as to persons of a white complexion.

We maintain that no compensation should be given to the planters emancipating their slaves:

Because it would be a surrender of the great fundamental principle, that man cannot hold property in man . . . :

Because, if compensation is to be given at all, it should be given to the outraged and guiltless slaves, and not to those who have plundered and abused them."

the administration of President Abraham Lincoln when it became evident that the government had not engaged in war for the purpose of destroying slavery. Instead, they increased their demands for immediate abolition.

After the Emancipation Proclamation of 1863, abolitionists pushed for a constitutional amendment on abolition. In July 1865, after the passage of the Thirteenth Amendment, which prohibited slavery, Garrison abandoned the American Anti-Slavery Society, declaring that it had fulfilled its aim. The society lasted until 1870 after the passage of the Fourteenth and Fifteenth Amendments, which were meant to protect the rights of African Americans.

Abolition of the European Slave Trade

The institution of slavery had existed and had been sanctioned for thousands of years, but the slave trade of the fifteenth through eighteenth centuries was unique for its racialized nature, its linkages with New World exploration, and its sheer magnitude: although historians continue to debate specific numbers, it is clear that during four centuries between 11.5 million and 12 million Africans were brought to the New World in the largest forced migration in human history. The abolition of the Atlantic slave trade, accomplished during the nineteenth century, marked an end to the commerce in human beings that had shaped European, New World, and African history (and individual lives) since the Europeans' arrival on Africa's west coast in the 1400s.

The slave trade was instigated by the Portuguese in 1444, when 235 African slaves were sold at public auction in Portugal. Both the Portuguese and the Spanish used slave labor to produce sugar on islands off the African coast in the 1400s and then after 1500 transported slaves to the New World to perform plantation labor and hunt for gold and silver. The relatively small trade in the 1500s and 1600s became a vast market in the 1700s as a system of global triangular trade developed to which slavery was intricately bound. European commodities were traded in coastal Africa for slaves, who were transported primarily to the New World. Slave-grown products such as sugar, cotton, and tobacco were then traded back to Europe. All European states with American colonies—among them France, England, and the Netherlands—and a few others such as Prussia participated. From 1680 to

1808, Britain was the main transporter of African slaves across the Atlantic. The late eighteenth century saw the highest numbers of slaves transported, with 24,000 slaves exported from African ports each year in the last quarter of the century. Between 1780 and 1790, 750,000 Africans were transported across the Atlantic, 325,000 by Britain alone.

As long as the slave trade had existed, some had protested it. A few voices cried out in the 1500s and 1600s, and during the Enlightenment and Revolutionary eras, a host of philosophers, evangelical Christians, and others joined the ranks of the critics. The number and power of these voices increased in the late 1700s, particularly in England. Quakers in the British colonies had long protested the institution. After the American Revolution some suggested ending slavery or the trade, but Article V of the U.S. Constitution forbade discussion of banning the slave trade until 1808. For reasons both material and moral, England became the site of the most resistance to the slave trade in the late 1700s. One of the first blows against slavery came in 1772, when a British court ruled that James Somerset, a slave transported from Virginia to England who subsequently had escaped only to be recaptured and placed in shackles on a ship bound for Jamaica, should be set free. The Somerset case is wrongly thought of as one that ended slavery, but it did contribute to the erosion of support for the institution.

Protest against the trade in England arose, and interested British citizens employed sugar boycotts, political petitions, and other methods to protest. Quakers worked to expose the horrors of slavery, and in 1787 the London Abolition Committee (LAC) formed, adopting the plank that the slave trade was “both impolitick and unjust.” As the slave trade was seen as the root of the evil of slavery, many decided to focus on ending it first. The image of a kneeling, chained slave pleading, “Am I Not a Man and a Brother?” appeared on snuffboxes, cufflinks, rings, and other objects and became an icon of antislavery work. Reformers circulated published narratives of slaves to increase British sympathy and to expose the evil of the slave trade.

In 1792, 519 petitions with 390,000 signatures flooded Parliament. Members of Parliament

▶ OLAUDAH EQUIANO'S FAMOUS PROTEST OF THE SLAVE TRADE

British antislavery activists worked to arouse sympathy by highlighting the harsh realities of slavery and of the slave trade, particularly the horrors of the Middle Passage, the trip across the Atlantic in a cramped, unhygienic slave ship. One of the most poignant antislavery narratives was that of Olaudah Equiano. Generally thought to have been born in 1745 in present-day Nigeria, Equiano was kidnapped and sold into slavery as a child. As slave to a naval captain and British merchant, Equiano eventually was able to buy his freedom. In 1789 with the support of the recently founded Society for the Abolition of the Slave Trade, he published *The Life of Olaudah Equiano, or Gustavus Vassa, the African*, which quickly became a best-seller.

Some of the book's most famous passages depict the brutalizing effects of the slave trade. Taken aboard a slave ship, he recalled, "I was soon put down under the decks, and there I received such a salutation in my nostrils as I had never experienced in my life; so that with the loathsomeness of the stench, and crying together, I became

Frontispiece and title page from *The Interesting Narrative of the Life of Olaudah Equiano*, 1789. (Library of Congress)

so sick and low." He offered readers a firsthand account of the sights, smells, and experiences of the Middle Passage, even describing the suicide of two slaves. Although one scholar recently argued that Equiano was born in South Carolina, not Nigeria, his narrative, one of the few works penned by an African in the eighteenth century, resonated with many as they contemplated the abolition of "the inhuman traffic of slavery."

—Bonnie Laughlin-Schultz

also protested. William Wilberforce, a member and leader of LAC, delivered an angry speech condemning the trade in 1789, and the first heated debate in the House of Commons followed. The war with France sidetracked the anti-slave trade movement briefly, but by 1804 (following Napoleon's reintroduction of slavery, which had been temporarily abolished during the French Revolution), LAC began pressuring Parliament again. On March 25, 1807, Parliament passed the Abolition of the Slave Trade Act, which fined captains of slave ships.

After abolition, Britain pressured other countries to end their trades. The Danes had already abolished slavery in 1802 (the law was passed in 1792, but its provisions were not to take place for ten years), and the British Royal Navy patrolled the Atlantic to enforce the end of its trade and published antislavery tracts into French, Spanish, Portuguese, and Dutch. The American slave trade was outlawed in 1808, and the French and Dutch followed in 1815 and 1814, respectively. At the Congress of Vienna in 1815,

Great Britain offered blanket condemnation of the trade, negotiating treaties with Spain, Brazil, and other importers to eliminate their trade to America. Legal trade of slaves in the Atlantic finally halted once and for all in 1867. While an illegal trade flourished throughout the nineteenth century, the legal end of the slave trade in Britain and elsewhere dealt a large blow to the institution of slavery.

The End of Serfdom in Prussia, Austria-Hungary, and Poland

The peasants of eastern Germany (Prussia), Poland, and Austria-Hungary were freed from serfdom in the first half of the nineteenth century. Serfdom, a system by which peasants were legally bound to the land they tilled and were required to work the land for their landlord as well as pay rent in money and/or in produce, had died out in most of Europe west of the Elbe River by the end of the fifteenth century, though localized pockets of it existed in France until its abolition in 1789 and in Scotland until 1799. While serfdom was being abandoned in western Europe in the fifteenth century, it was being imposed on the peasants of central and eastern Europe, where it had not existed previously.

The rise of serfdom in eastern Germany, Poland, Lithuania, Bohemia, and the areas conquered by the Austro-Hungarian empire from the Ottoman empire, a process which has been called “the second serfdom,” has been attributed to the push by landed aristocrats for a stable and cheap labor force needed to produce grain in a developing market-oriented agricultural system; this goal was coupled with the drive by incipiently centralizing governments for what they believed was a more rational system of rural taxation. In all cases, it was a collusion of the interests of both the aristocracy and weakly centralized governments to reduce the peasants’ personal freedom and tie peasant labor to the land for the economic purposes of the aristocrats and fiscal purposes of the state. In Poland, serfdom was regulated by the Piotrkow Statute of 1496, while in eastern Germany the institution developed after the suppression of the peasants in the Peasants’ War of 1524–1526. During the struggle with the Ottoman empire the Habsburg rulers imposed serfdom in Hungary. Czech peasants were reduced to serfdom after the suppression of the Bohemian

Revolt (1618–1621) at the outset of the Thirty Years’ War (1618–1648).

After the Thirty Years’ War, serfdom in eastern Germany became especially repressive in Mecklenburg, Pomerania, and Prussia. There, serfs were sometimes forced to perform unpaid labor on the estates of the nobles for up to six days a week, as well as to pay to the landlords, in money or goods, more than 30 percent of their incomes in rent. The landlords controlled serf marriages, and serfs had no freedom to move. Serfdom began to assume most of the attributes of slavery, and the serfs were looked on as an inferior and despised class.

In the eighteenth century, responding to the ideas of the Enlightenment, movements to abolish or ameliorate both slavery and serfdom began to gain ground. In addition, the idea that serf agriculture was inherently inefficient and unproductive began to take root by the middle of the eighteenth century in the governing circles of the liberalizing but absolute monarchies of Austria-Hungary and Prussia. Both governments passed decrees to curtail the worst abuses of the oppressive institution. Maria Theresa, ruler (r. 1740–1780) of the Austro-Hungarian empire promulgated with her son and heir, Joseph, a 1780 decree regulating the labor (*robot*) serfs were required to render freely to the landlords. As a result, the requirement that serfs give free labor to the landlords was limited to no more than three days a week, whereas previously it had been unlimited. In 1781, Maria Theresa’s son Joseph II (r. 1780–1790) promulgated two decrees governing serfdom in Bohemia, restricting the power of serf owners over serfs and giving the serfs freedom of movement, freedom to marry, even freedom of occupational choice. Serfs were given the right to buy the plot of land they farmed and many took advantage of this privilege. Joseph tried to introduce a system where serf labor (*robot*) would be changed to a system of peasant tenantry. Serfs on crown land in Bohemia and Moravia were freed. Unfortunately, the decree met strong resistance by nobles and was substantially modified in Hungary. In Prussia, the state actively supported the power of the nobles (*Junkers*) over the serfs, though Frederick II (“the Great”) is said to have personally disliked the institution of serfdom.

The process by which the “second serfdom” was abolished received further inspiration when the Constituent Assembly of France declared the feudal order suppressed on August 4, 1789. With this, the remaining vestiges of serfdom were put on their way to extinction, but the final annihilation of feudal rights was not complete until 1793 when the conditions by which the peasants redeemed their rights to land were established. Because of this and the promise of social equality implicit in the French Revolution’s Declaration of the Rights of Man and of the Citizen, serfdom in eastern Europe was increasingly seen as an anomaly. The revolutionaries of France carried the ideology of human equality throughout western Europe, and when Napoleon’s armies defeated the armies of the Fourth Coalition at the Battle of Friedland (1807) the Prussian king, Frederick William III (r. 1797–1840) and his talented chief minister, Karl von Stein, in order to ensure the loyalty of the Prussian peasants as well as to strengthen the Prussian economy, issued a decree abolishing serfdom (1807). The decree ended the nobles’ control over the peasant’s freedom to marry and to move in the search of better opportunities. Importantly, the decree banned the system of forced unpaid labor the peasants had been required to render their landlords. It did not give the peasant property rights in the land they tilled, which they were expected to occupy as rent-paying tenants. This was a gift of personal freedom without land.

After Napoleon’s victory at Friedland over the Russians and the resulting Treaty of Tilsit (1807), the core of Poland was organized as the Grand Duchy of Warsaw. This was essentially a satellite of the Napoleonic empire, ruled by the French ambassador in Warsaw. The Napoleonic Code was imposed on the new state, and serfdom was explicitly abolished. But, as in Prussia, the peasants gained personal freedom, and freedom from forced labor, but without any land. In Poland as in Prussia, the peasants became rent-paying tenants. (It is ironic that while Napoleon was abolishing serfdom in Poland, he was re-imposing slavery in the French West Indies.) After the collapse of Napoleon’s empire and the Congress of Vienna in 1815, the Grand Duchy of Warsaw was ruled by Russia. Russia maintained its system of serfdom in Russia proper until

➤ AN ENLIGHTENMENT PHILOSOPHER ON ABOLISHING SERFDOM IN POLAND

In 1771, the French political philosopher Jean-Jacques Rousseau was recruited by a group of Polish patriots to draw up recommendations on the steps Poland might take to strengthen its monarchy and protect itself from interference from Prussia, Russia, and Austria-Hungary. The result was Rousseau’s *Consideration on the Government of Poland*, a work in which the famous Frenchman recommended freeing the serfs but only when the serfs were prepared for it.

“To free the common people of Poland would be a great and worthy enterprise, but bold, perilous, and not to be attempted lightly. Among the precautions to be taken, there is one which is indispensable and requires time; it is, before everything else, to make the serfs who are to be freed worthy of liberty and capable of enduring it. . . . whatever happens, remember that your serfs are men like you, that they have in themselves the capacity to become all that you are. Work first of all to develop that capacity, and do not free their bodies until after you have freed their souls. Without this preliminary, you may be sure that your enterprise will fail.”

—Wilfred J. Bisson

Source

Jean-Jacques Rousseau, *Considerations on the Government of Poland* (1772), Chapter VI.

1862, but in its Polish provinces, the 1807 abolition of serfdom was not repealed.

In Austria-Hungary, the requirement of forced serf labor (*robot*) was abolished in the Revolution of 1848. With the end of the *robot*, the last vestige of serfdom disappeared, and many of the lesser gentry in Austria were ruined as numbers of the freed peasants migrated to the growing cities. In Hungary, where serfdom persisted until 1853, the nobles prospered because their landholdings were much more extensive and because the Hungarian nobles were given more liberal payments for their freed serfs.

After 1853, the abolition of serfdom in nearly all of Europe outside of Russia was complete.

The Abolition of Serfdom In Russia

On February 21, 1860, the Russian government issued legislation that emancipated more than 20 million serfs on noble lands. Similar statutes in 1863 and 1866 granted freedom to another 30 million peasants who lived on Crown and state lands. Although scholars continue to debate the consequences of this emancipation, all agree that it marked a turning point in Russian history. While serfdom had existed in Russia in various forms for more than 500 years, by the 1850s many educated Russians, influenced by

events of the preceding century, including the Enlightenment, the American Revolution and the French Revolution, the abolition of slavery in most of the Americas, and the end of serfdom in Central Europe, no longer defended serfdom on intellectual or moral grounds. Tsar Nicholas I (1825–1855) had established nine commissions to study serfdom and recommend reforms. However, few significant changes occurred because of the many practical issues raised by any large-scale emancipation scheme and the potentially disruptive economic and political effects of liberation. Why then did the situation change so rapidly?

Russia's defeat in the Crimean War revealed Russia's internal weaknesses and convinced the new tsar, Alexander II (1855–1881), that emancipation was a necessity. From the outset Alexander made it clear to the nobility that emancipation in one form or another was inevitable and intervened repeatedly to overcome the resistance of the rank-and-file gentry. In 1857 the government encouraged nobles in every province to form committees and draft proposals for change. In 1858 after many of these proposals suggested emancipating serfs without giving them any land of their own, Alexander declared that emancipation had to include land to minimize the danger of forming a large mass of discontented landless rural poor. From then on the general principle guiding the deliberations of the various commissions involved in drafting the legislation was that serfs should receive an amount of land roughly comparable to that which they had farmed for their own subsistence under serfdom.

What this meant in practice was, of course, open to dispute, and in the final legislation the nobles were generally successful in minimizing both the amount of land and the quality of the land that the serfs received. The serfs also had to compensate the landlords for the land they acquired. However, since most serfs lacked the funds for this, the state was to pay the nobles, and the peasants were then to repay the government through annual redemption payments over the next 49 years. The price that the peasants paid for the land was far more than it was worth, because even though the government denied it, the price was also meant to compensate the

► CHRONOLOGY—KEY DATES IN THE ELIMINATION OF SLAVERY AND SERFDOM IN THE WEST

- 1789—Revolution eliminates last vestiges of feudalism in France.
- 1806—Serfdom ends in Prussia, Bavaria, and other German states.
- 1807–1808—Great Britain and the United States abolish slave trade.
- 1834—Slavery abolished in British colonies.
- 1848–1849—Revolutions lead to abolition of serfdom in Austria and Hungary.
- 1854–1856—Russian defeat in the Crimean War strengthens the hand of reformers and convinces Tsar Alexander II of the need to confront the issue of serfdom.
- 1857—Tsar Alexander II calls for emancipation proposals.
- 1861—Emancipation Statute for serfs on private lands. Start of American Civil War.
- 1863—Emancipation Statute for peasants on Crown lands. Emancipation Proclamation in the United States.

nobles for the loss of the serfs' labor and dues. To ensure that the redemption payments (and other taxes as well) were paid, the peasant commune (*mir*) was made collectively responsible for all peasant obligations and given extensive powers over its members.

In trying to accommodate the interests of nobility, the government knew that it risked angering the peasantry and did its best to either diffuse or suppress unrest. Violent protests still broke out in various areas in the weeks following the decree, but these were quickly crushed by police and the army. Although the disturbances soon ended, tensions in the countryside remained high, with large numbers of peasants bitterly hostile to both the nobles and the government. This resentment grew in succeeding decades as new economic and political developments worsened the peasants' plight, helping set

the stage for full-scale revolution against the imperial regime in 1905 and 1917.

Abolitionist Movements in Great Britain and Europe

Abolitionist movements, supported by disciples of the Enlightenment who believed in the principle of universal human rights and by Christians who were repulsed by the many cruelties of slavery, first appeared in Europe in the late eighteenth century and the nineteenth century.

Abolitionist movements began in Great Britain, whose merchants dominated the transatlantic slave trade in the eighteenth century. The issue first attracted public attention in the 1760s and early 1770s when an English lawyer, Granville Sharp, unsuccessfully challenged the legality of slavery in Great Britain in a number of widely publicized court cases including the so-called *Somerset's Case* of 1772, when the presiding judge Lord Mansfield did, however, rule that it was illegal to forcibly remove a slave from England. Sharp also played a key role in the founding of the Committee for the Abolition of the Slave Trade, whose members sponsored lecture tours and petitioned members of Parliament to end the slave trade. They also sponsored the publication of many books and pamphlets, including the widely read *The Interesting Narrative of the Life of Olaudah Equiano*.

In Parliament, opposition to the slave trade was supported by a core group of 35 to 40

➤ CONSUMER HABITS AND SLAVERY

Sugar was the first crop to use the plantation system, a system which would eventually also be used for other crops (including cotton). Brazilian sugar plantations were developed mainly by the Portuguese, while those of the West Indies were controlled by the French, British, Spanish, Dutch, and Danes. The rise of slave labor increased sugar production while lowering the price, meaning that sugar became available not just to the wealthy, but also to the middle and then lower classes. More sugar meant that west Europeans could fuel their escalating coffee, chocolate, and tea habits, all of which increased the necessity for slave labor and further lowered the price of sugar.

Another result of sugar and the plantation system was the mass development of rum, made in the Caribbean by pressing juice from the sugarcane plant, separating it from molasses, adding yeast and water, and distilling it for various periods of time. The tiny island of Barbados produced greater revenue for England than the combined tobacco colonies of Virginia and Maryland. After the abolition of slavery many Caribbean islands maintained rum as a major export product, and production patterns—such as distilling time or the use of molasses versus sugar juice—have been transformed from vestiges of slavery and colonialism into sources of local and national pride.

—Melissa Verlet

abolitionists led by William Wilberforce known as “the saints.” Their major success was the passage of the Slave Trade Act of 1807, which effectively barred British merchants from participating in the slave trade. The British thereby joined the Danes, who had abolished the slave trade in 1792, and soon were joined by the United States, which banned the slave trade effective on January 1, 1808. After the 1807 act slaves were still held, though not sold, within the British Empire. The abolitionist movement revived in the 1820s after the end of the Napoleonic Wars. This time its target was the institution of slavery itself. In 1823 the Anti-Slavery Society was founded and included many members who were veterans of the Committee for the Abolition of the Slave Trade. A notable feature of the revived abolitionist movement was the increase

in female participation and an insistence by abolitionist leadership that political candidates publicly pronounce their stance on slavery. In 1833 Parliament passed the Slavery Abolition Act, which called for the emancipation of slaves in Britain and the British Empire no later than 1838. A sum of £20 billion was set aside to compensate slave owners; no compensation was provided for the former slaves. Throughout the nineteenth century, Britain used its navy to interdict slave ships and exerted diplomatic pressure on many nations to end the slave trade and slavery.

French abolitionists were influenced by British antislavery leadership but tended to couch their arguments in secular rather than religious terms. The Society of the Friends of Blacks was founded in 1788 and remained in existence until 1793. In early 1789 it had 141 members. In its five years of existence, it published antislavery literature and lobbied the revolutionary National Assembly to end French participation in the slave trade. In February 1794 at the height of the revolution’s radical phase, the National Assembly passed the sweeping Universal Emancipation decree, which effectively freed all colonial slaves. The law was impossible to enforce, however, and once in power Napoleon once more made slavery and the slave trade legal. Although another organization, the French Society for the Abolition of Slavery, emerged in the nineteenth century, slavery was not outlawed again until 1848, and the smuggling of slaves to the French West Indies continued until the 1870s.

Spain, Denmark, Portugal, the Netherlands, and the Ottoman empire, in many cases in response to British diplomatic pressure, all ended slavery at some point between 1847 and 1886. Having already been abolished in all the states of the Western Hemisphere, in the course of the 1800s slavery ended in Cuba in 1886 and Brazil in 1888.

■ Introduction: Gender and Sexuality

The major changes of the modern period—political revolution, industrialization, urbanization, imperialism, and the rise of science and secularization, among others—greatly affected gender and sexuality. The traditional orders that had regulated gender and sexuality for millennia in some cases, such as Christianity, Islam, Hinduism, and Confucianism, were challenged by the transformations of the time. The attack on tradition could come from many sources. The wave of industrialization that swept from late-eighteenth-century Britain to Meiji Japan brought working-class women out of the home and into factories and other places of paid employment, leading to transformations in gender and household relations. Empire, by bringing cultures into sometimes violent conflict, led to the spread of Western ideas about gender and sexuality to countries with very different traditions. Imperial power brought about such results as the abolition of sati in India, the missionary campaign to abolish footbinding in China, and the introduction of laws against homosexuality in societies that did not previously have them. The East, particularly including the Islamic world and eastern Asia, also became a symbol of both heterosexual and homosexual license in the eyes of European and Euro-American men. The rise of large urban centers, with their cultures of anonymity, led to the expansion of male and female prostitution as well as the growth of gay and lesbian subcultures.

Beginning with the European Enlightenment, sex and gender were increasingly analyzed in scientific and medical rather than religious terms. Secular and anticlerical political movements led to state law replacing religious law in governing sexual relations, although the content of the law was often similar. Male and female homosexuality—a term invented in this

period—and other “deviations” were increasingly understood as “unnatural” rather than sinful, although no less harshly punished. Although many religious writers and preachers participated in the great crusade against masturbation that was so marked a feature of Western sexuality in this period, physicians led the charge, which focused more on the disastrous consequences of the “solitary vice” in this world than in the next. The increasing criminalization of abortion often saw male physicians assert the superiority of their expertise over that of pregnant women. The creation of a male-defined “science of sex” was the work of the nineteenth century, particularly in the German lands, culminating in the psychoanalysis of Viennese physician Sigmund Freud.

As more women gained access to literacy and the ability to publish and circulate their work, criticisms of traditional gender roles were more widely read, discussed, and analyzed. The emancipatory impulse arising out of the Enlightenment and the American and French Revolutions was applied by women in the Western nations, who increasingly organized for the vote, control over personal property, and access to higher education and the professions, this despite the fact that the leaders of the French Revolution and the revolutions that followed in its stead were often more interested in curtailing women’s political influence than expanding it. Although the vote was only attained in a few peripheral regions such as Wyoming and New Zealand, efforts in other areas proved more productive. Women’s access to education was also related to the creation of new professions in the expanding economy of the nineteenth century such as nursing, teaching, and clerical work, although these were all treated as inferior or ancillary to male professions. The opening of professions to

women did not mean that all men and women approved of women working outside the home, however. The period also saw the rise of a “domestic ideology”—sometimes referred to as the “cult of domesticity”—that was strongest in the middle classes, which viewed women as particularly biologically suited for marriage, motherhood, and housekeeping.

—William E. Burns

Women in Meiji Japan

The Meiji period (1868–1912) is lauded as the time when Japan instigated a series of political and social reforms leading to institutional reconstruction in the name of modernizing and Westernizing. These changes were carried out in order to achieve *bunmei kaika* (“civilization and enlightenment”) and were seen as a way

to build a strong nation; they were so successful that by World War I Japan was the only non-Western great power. During the Meiji period, women’s roles and all aspects of their lives—political, private, and public—were influenced not only by their social class and their access to education and work but also by new government laws and restrictions.

Although women were legally banned from political participation in 1890, prior to that, during the 1880s and the Freedom and Popular Rights Movement (*jiyu minken undo*), there were many women advocates for equal rights as well as the elevation of women in the family and society. Women’s education, equal rights, monogamy, divorce (men had the right to divorce on the grounds of adultery but women did not), and the outlawing of prostitution and concubinage all became contested issues during the 1880s. Some intellectuals at the time believed that reform of the family was enough to elevate the status of women, for example by banning concubinage and enforcing monogamy. Fukuzawa Yukichi (1853–1890) was one of the earliest participants in the debate about women (*fujin ronso*) and the author of *Nihon Fujinron* (*Discourse on Japanese Womanhood*), published in 1885. Other intellectuals, however, viewed the elevation of women as linked to their access to political rights. During the popular rights movement both male and female activists demanded that women be given equal political rights to men. Kishida Toshiko (1861?–1901), a woman who was part of the popular rights movement and also a member of the Liberal Party during the 1880s, undertook a major speaking tour around Japan to advocate for women’s political rights. Women as well as men were struck by Kishida’s speeches; for most of them she was the first woman they heard lecture about the need for women’s liberation and the principle of equality among men and women. Kishida inspired many women to form their own local organizations and also helped organize the Women’s Lecture Society in Kyoto. Its founding meeting in 1883 had 2,000 women participants. Kageyama Hideko (1865–1927) was another female activist who was inspired by Kishida; she also gave political speeches and inspired the

Fukuzawa Yukichi was one of Meiji Japan’s most influential thinkers. An advocate of Westernization, he supported parliamentary government, public education, and women’s rights in addition to many other causes. (Fukazawa Memorial Center for Modern Japanese Studies, Keio University)

growth of larger feminist groups such as the Japan Christian Women's Reform Society (Nihon Kirisutokyo Fujin Kyofukai) and Women's Morality Association (Fujin Tokugikai). The period of women's political activism was short-lived, however. After 1884 the government enforced restrictions on popular speech, and women advocates turned to expressing their opinions in journals and magazines, whose circulation was limited to those privileged enough to read them.

In 1890 the cabinet enacted the Law on Associations and Meetings (*Shukai oyobi kessha ho*), which barred women from attending political meetings or joining political organizations. In 1900 the Home Ministry redrafted these bans as the Security Police Law (*Chisan keisatsu ho*). The Civil Code of 1898 reinforced women's legal status by reinforcing the patriarchal model of the family, mandating inheritance by primogeniture, and stating that a woman had no share in her husband's property while all of her property became his. It also decreed that a woman had no legal rights to her children.

During the Tokugawa period (1600–1868) according to different local practices and legislation, some women had participated in local politics. Because the Tokugawa shogunate had been unable to impose systematic control over all the domains, local society was often beyond central state control. In some domains, widows had been allowed to take their husbands' place on village councils, and in others women participated in elections. However, during the Meiji period, when the government examined the constitutions of other Western countries, they followed the examples set by the leading Western countries and barred women from any political involvement for the first time in Japanese history.

While women were barred from political participation, they did, however, gain access to education during the Meiji period due to the government's expansion of the national education system. Compulsory primary education for both males and females was mandated in 1873; however, it had to be retracted due to difficulties in securing money, finding sufficient teachers, and convincing rural parents to send their children to school. In 1890 only slightly more

➤ GOOD WIFE, WISE MOTHER

The role of women as embodying *ryosai kenbo* ("good wife, wise mother") was popularized by the Ministry of Education in its urging that women uphold moral examples for their families. The ideal of "good wife, wise mother" was not for all women, however. The Ministry of Education did not demand that lower-class women leave the workforce and return home but instead reminded middle-class women who were already at home of the importance of their role in maintaining the family. Lower-class women did not have the luxury of staying at home to raise their families. They needed to work to make a living. Part of the "good wife, wise mother" ideology was to promote the idea that women should be excluded from politics not due to their physical, mental, or moral inabilities but rather because their primary duties were at home.

—Kirsten Ziomek

than 30 percent of females actually attended school. However, in 1900 the government made four years of education compulsory education. In 1910 the compliance rate had risen to 97.4 percent, and compulsory education had been extended to six years. In 1899 a law established at least one higher school for girls in each prefecture. Education in higher schools for females and males differed drastically. The curriculum of girls' higher schools was not the academic equivalent of boys' middle schools, let alone equal to the curriculum of boys' higher schools. The differences between female and male higher schools were due to perceived gender roles. For women, the purpose of higher schools was to cultivate refined taste and a gentle and modest character. For men, higher schools prepared them for the entrance exams to the elite universities, which remained bastions of male students. Women were to gain enough education to prepare them for their duties as wives and mothers and were not to receive any more education than necessary. The women who went beyond compulsory education to the higher schools were usually from middle-class families. While most rural women completed the years of compulsory education, oftentimes they had to stop

going to school in order to help their families on the farm or went to the cities to earn money in the factories.

By 1890 working-class women were a crucial component of the developing industrial economy. There were more female workers than males in light industry; in textiles the workforce was 60–90 percent female. During the late nineteenth century females produced 40 percent of the gross national product and 60 percent of products for foreign exchange. During the first decade of the 20th century, 60 percent of the workforce in factories and shops were female. The working conditions of women and children were harsh, comparable to those in the West during early industrialization. Peasant girls from the countryside who had been sent to the city by their families to help supplement farm income comprised much of the workforce in factories.

In 1901 the government founded the Japan Women's Patriotic Association, an organization that proclaimed that women should help prepare the nation for war and that in time of war their role included consoling the nation's families. From 1901 on, women participated in government-sponsored organizations, often in relation to war efforts. While some women turned their attention away from issues of women's rights in order to help with war efforts, other women continued to debate the proper role of women in both the private and public spheres. During the Taisho period (1912–1926) women feminists such as Yosano Akiko, Yamakawa Kikue, Hiratsuka Raicho, and Yamada Waka became well known for their participation in very heated debates about the protection of motherhood from the government, the role of women as mothers, and equal rights. Although the ban against women's attendance in political meetings was lifted in 1922, the struggle for suffrage was longer, with Japanese women gaining the right to vote in 1945.

Feminism in Late Qing China

Feminism in late Qing China (1644–1912) offered Chinese women a theoretical foundation for the advancement of their interests in twentieth-century society. During the 1890s and early 1900s, feminism promoted the idea of equal rights for women in political, social, and economic arenas, and women sought to realize these goals through collective action. Drawing on both indigenous and Western sources, late Qing intellectuals merged feminism with the struggle for national liberation from Western imperialism and Manchu occupation. Thus, feminist goals were intertwined with nationalist aspirations.

The position of Chinese women—expounded upon and culturally reinforced by Confucian scholars for many centuries—was considered to be inferior to that of men. Learning from oral instructions and basic literacy, women from gentry households were expected to show strict obedience to male family members, confine their activities to the domestic sphere, and observe rules such as foot binding, gender segregation, chastity, and womanly virtues. They were generally excluded from public occupations, thus making them economically dependent. All of these factors combined to subordinate gentry women through the Qing period.

Nevertheless, during the Qing era challenges emerged with the purpose of transforming the subordinate position of women of all social classes. These challenges included profeminist male writings by authors such as Yu Zhengxie and Li Ruzhen in the mid-Qing period, mid-nineteenth century peasant rebellions such as the Taiping Rebellion, and marriage-resistance associations in southern China, especially Guangdong.

None of these challenges, however, gained wide support among Chinese women. It was not until the 1890s that feminism gained strength through the movements to end foot binding and establish female schools. Inspired by Christian missionaries and currents of Western liberal thought, late Qing reformers such as Kang Youwei and Liang Qichao advocated both movements as a means of conferring educational opportunities for women in order to save China.

Feminism in China reached its maturity in the 1900s. Stimulated by missionaries and reformers and accelerated by media culture, some women activists demanded equality in several spheres. For example, Chen Xiefen propagated women's educational rights. Qiu Jin taught Chinese girls to dedicate themselves to anti-Qing revolution. Zhang Zhujun alerted women to the issue of economic independence. He Zhen proposed a women's revolution and a women's suffrage movement in China. Like other late Qing reformers, these women were moved by a growing concern for national salvation and integrated feminist aims within a Chinese nationalist framework.

Feminism also took the form of organized action on the part of late Qing women. Founding women's periodicals, establishing female schools, forming patriotic associations, raising funds for revolution, and plotting anti-Qing uprisings were key strategies for raising awareness and fostering greater equality. Some of these activities were partly influenced by contemporary suffragist activities in Europe and the United States. Although the feminist struggle would continue after the fall of the Qing dynasty (focusing in particular on women's suffrage and sexual liberation), the immediate outcome of feminism was the awakening of some Chinese women to become actively involved in public affairs apart from their domestic roles.

➤ QIU JIN

Qiu Jin (1875–1907), pioneer of the women's movement in China, came from a scholar-gentry family in Zhejiang province. Unconventional in behavior, she practiced fencing and riding and dressed in male attire in her formative years. In 1904, she went to study in Tokyo. While in Japan she encouraged Chinese female students to fight for equal rights and filled them with patriotism. Upon her return to China in 1906, she founded a women's journal, directed a female school, and organized some anti-Qing uprisings. With the exposure of a plot in Hangzhou, she was arrested and executed in 1907. Qiu Jin was regarded as a woman martyr in the events leading up to the 1911 Chinese Revolution.

The Ending of Sati in India

Sati is a form of ritual suicide in which a Hindu widow throws herself on her husband's funeral pyre to show absolute monogamous marital devotion to her spouse even in death. Reluctant women were sometimes coerced into practicing sati or were thrown onto the fire by others. The practice originated in honor of the Hindu goddess Sati (or Dakshayani), who burned herself in response to the humiliation of her husband (Shiva) by her father.

It is unclear when the practice began, though it clearly originated over 2,000 years ago. Sati was practiced across India by 1000 CE (and still occurs occasionally in the twenty-first century), but it became a regional, sporadic, and underground phenomenon by the late nineteenth century.

Sati began to decline with the Mughal conquest of India and the arrival of Europeans in the sixteenth century. Although the Muslim Mughals were determined to respect local customs, believing that cultural autonomy helped

► CHARLES NAPIER AND SATI

Sir Charles Napier (1782–1853) is often credited with one of the most famous quotes in British imperial history. As governor-general of the Sindh, a province he captured in early 1843 at the head of an East India Company army, Napier followed the lead of several other British administrators by outlawing sati. When local Hindu leaders complained to Napier that this measure destroyed centuries of custom and tradition, he allegedly replied, “This burning of widows is your custom; prepare the funeral pile. But my nation also has a custom. When men burn women alive we hang them, and confiscate all their property. . . . Let us all act according to our national customs.”

Though a colorful story, it is uncertain whether or not this famous exchange took place or, if it did, exactly what was said; there are several versions. What is certain is that Napier did outlaw sati in the Sindh and that this act caused sati in the region to soon die out or be driven underground.

promote order, they disapproved of sati and frequently tried to suppress it. However, Mughal policy on the matter frequently changed, and efforts to eliminate sati were inconsistent. Thus, though the practice waned under Mughal rule, it did not die out.

The first Europeans in India, the Portuguese, who as Catholics believed that suicide was a mortal sin, outlawed sati in their territory of Goa, although the practice was not common in this part of India. Subsequently the Dutch and French banned the practice in the small territories they controlled. Individual British officials in the 1700s made efforts to eliminate the practice but without the official backing of the British East India Company. Responding to pressure from liberal reformers and evangelical Christian groups in Britain, the company banned the practice in Kolkata in 1798 and began collecting data on the extent of the practice in 1813. By then, opposition to the practice included a number of Hindu

leaders and intellectuals, including the “Father of Modern India,” Ram Mohun Roy, whose sister-in-law had been forced to commit sati. A major step was taken in 1829, when Lord William Bentinck (1774–1839), governor-general of Bengal, outlawed the practice of widow burning in the territory under his control, claiming that it was barbaric and theologically unjustified. Officials were required to report instances of sati, with the perpetrators to be tried in British courts. Hindus unsuccessfully challenged the ban in the courts, but it was upheld in 1832. Subsequently, other territories under British control also enforced the ban, although some princely states not directly administered by the British continued to tolerate the practice until the early 1900s.

Many Indians resented this example of British interference with their customs, and the controversy over the banning of sati was one of many factors that contributed to the Indian Rebellion of 1857.

Ottoman Women

Ottoman women's concern with love and sex, and the forms through which this was expressed, took on a new prominence in the nineteenth century as the multiethnic, multifaith empire underwent major periods of reform and accelerated social change. Though many of the formal changes, notably those of the Tanzimat reforms (1839–1876), were directed at men's political and social roles (notably the development of a secular-influenced education system and the palace bureaucracy or civil service), it was widely understood that the ramifications of these innovations were altering women's social roles and the relations between men and women. The advent of Sultan Abdulhamid in 1876 brought

a suspension of the Tanzimat constitution, and though the sultan continued, for example, many of the education reforms undertaken by his predecessors, many Ottomans found his reign to be culturally and politically repressive. This was especially so for elite Ottomans involved in the palace bureaucracy and for those prominent in the reformist factions (of which the young Turks were to eventually emerge as the most prominent in the 1908 revolution that reinstated the constitution).

In a period noted for Abdulhamid's censorship of the press and his network of spies, matters of love took on a heightened significance as a proving ground for personal freedom. As Duben and Behar (1991) point out, when it was difficult to directly express political demands, the demand to choose affective marriages rather than arranged unions came to stand in for unavailable political liberties—for men and for women. In the politicization of love, the consumption of western (mainly French) literature was seen as a major factor. With elite women now often literate in European languages (owing to the increased numbers of foreign governesses in elite harems, and the attendance of mainly non-Muslim girls at foreign-run missionary schools), the consumption of western romances was sometimes held to be a mixed blessing, making girls dissatisfied with their lot in life and giving them unrealistic expectations.

Commentators from all political perspectives regarded the role of women as an indicator of the general state of the civilization, whether emancipation was seen as a sign of progress or of the decay of valued traditions. Ottomans of all political persuasions also knew that reforms were played out under the eyes of a curious West—whose fascination with the harem was longstanding. The Western Orientalist fantasies of the harem as a space of sexualized excess and depravity bore little relation to its existence as a family domicile, just as the western obsession with polygyny bore little relation to its actual practice, and by the mid-nineteenth century, its rarity. Ottomans were frustrated by western presumptions about the nature of their family life, though rebutting this was often made difficult by cultural prohibitions against discussing the family with outsiders.

Nevertheless, by the second half of the nineteenth century, women themselves were expressing opinions in ever-growing numbers. With increased female literacy, especially in the modernizing metropolises of Cairo and Istanbul, women's cultural and political participation outside the home began to expand. The women's press was active in both cities from the 1890s, and women writers discussed everything from marriage to fashion and from politics to domestic science. Well informed about western feminism, Ottoman women were not uncritical in their appraisal of Western so-called liberation. But the western model of chosen rather than arranged marriage and self-contained nuclear family living came to be associated increasingly with self-fulfillment and modernity in progressive and elite circles.

What has often, until recently, been overlooked is the extent to which progressive and reformist women were in direct contact with western feminists, not just by reading western sources, but also through networks of personal contacts with western women travelers and correspondence with western activists. This was a two-way exchange in which western women evaluated their own conditions in relation to the lives of Ottoman women. In the mid-century, women in Britain expressed envy that Islamic law, unlike British law, allowed women to own and inherit property, while at the end of the century, the British feminist Grace Ellison, used to male hostility at home, was astonished at the number of progressive Ottoman men who supported female emancipation as a part of a project of national social emancipation.

In the last quarter of the nineteenth and first quarter of the twentieth centuries, progressive Ottoman women (often but not exclusively Muslim) expounded their views in polemics, memoir, and travel literature written and published in French, German, and English. Specifically challenging western misconceptions about harem life, their books simultaneously intervened in local and international debates about women's rights. Books by women from this period, such as Fatma Aliye Hanum (1862–1936), Halide Edib (1883–1964), and Demetra Vaka (1877–1946), found a market in the West because of the often prurient appetite for harem literature.

Nevertheless, their books told of the challenges faced by a generation of women whose lives were often radically different from those of their mothers. In the transition that many of this generation experienced from the end of the empire to the advent of the Turkish republic (with its avowedly nationalist and secular project of westward-looking modernization), the sexual politics of love, marriage, and family life were experienced as bewilderingly, but sometimes empoweringly, unstable. The creation of new models of femininity—played out in personal relations and state regulation—was a crucial aspect in the development of regional modernities in the territories that had once been Ottoman.

Eighteenth-Century Feminist Writers

The rise to prominence of feminist writers during the eighteenth century reflected the changing perception of the role of aristocratic and bourgeois women in both French and British society. Writing for publication was a socially acceptable occupation for upper-class women, and many female writers commented on the evolving popular perception of acceptable behavior for women. The work of these feminist writers, who expressed themselves through both fiction and political tracts, was an expression of the influence of French Enlightenment ideals of personal liberty and English rationalist philosophy. Feminist writers through the century addressed

such diverse subjects as the purpose of female education, the role of wives and mothers within the family, and the range of acceptable occupations for respectable women.

At the beginning of the century, marriages between members of propertied families often focused exclusively on economic outcomes without regard for the personal inclinations of the married couple. Both husbands and wives contributed to the economic livelihood of their families through the management of aristocratic landed estates or the maintenance of the bourgeois family business. As the century progressed, the idea that marriage should provide romantic fulfillment as well as economic security became widespread, drawing attention to the individual qualities of women. During the late eighteenth century, society began to view the domestic realm as a separate sphere from the masculine realm of economic activity, with women responsible for setting the moral tone of the household instead of contributing to its financial stability. This separation of public and private spheres appeared in the works of such eighteenth-century writers as novelist Samuel Richardson and satirist Richard Steele.

British author Anne Finch, countess of Winchelsea (1661–1720), wrote poetry in the same classical Augustan style as her male contemporaries. While male poets often characterized women as passive receptacles for male adoration, Finch expressed the ideal of mutually satisfying relationships wherein both partners show respect for one another and make compromises to sustain the marriage. Finch shared the opinions of the seventeenth-century philosopher John Locke (1632–1704), who argued that women should have access to scholarly educations. The English author Mary Astell (1666–1731) argued that this education should be delivered in a convent-style setting to protect female students from the influences of a patriarchal society.

Another English woman, Hannah More (1745–1833), received a scholarly education from her father, who was the headmaster of a charity school. More believed that bourgeois women had a duty to provide a moral example for both their own families and poorer members of society. She expressed her views through numerous volumes of didactic works as well as the 1809

► RESPONSES TO MARY WOLLSTONECRAFT GODWIN

The radical nature of Wollstonecraft's *A Vindication of the Rights of Woman* and *Maria or the Wrongs of Women* as well as the author's extramarital relationships drew intense personal criticism from conservative male writers. The English politician Horace Walpole declared her a hyena in petticoats, while the Reverend Richard Polwhele stated that she deserved her death from complications following childbirth. Female writers, including those who espoused a conservative ideology, showed a greater degree of sympathy for Wollstonecraft and acceptance of her writings. The playwright Amelia Opie (1769–1853) based the title character of her play *Adeline Mowbray* on Wollstonecraft, emphasizing the pure intentions of her heroine. Literary critic Anna Barbauld (1743–1825) declared herself an admirer of *A Vindication* but feared that visiting the author of the treatise would result in ostracism from polite society. The pro-

tagonist of Frances Burney's (1752–1840) novel *The Wanderer* is an enthusiastic supporter of both women's equality and the French Revolution mirroring the experiences of Mary Wollstonecraft.

—Carolyn Harris

moral novel *Coelebs in Search of a Wife*. She supported evangelical religious movements, the founding of charity Sunday schools in working-class neighborhoods, and the campaign for the abolition of the slave trade.

In France, numerous eighteenth-century philosophes debated the status of women with society, most notably the Marquis de Condorcet (1743–1794), who published *On The Granting of Civil Rights to Women*. The French novelist Madame de Tencin (1682–1749) utilized the setting of medieval historical events to disguise her analysis of contemporary relationships between men and women. She condemned male domination within marriage because it was achieved by force instead of moral authority. Another French author, Olympe de Gouges (1748–1793), wrote political tracts in response to the French Revolution. Her *Declaration of the Rights of Woman* challenged the masculine focus of the manifestos issued by the Estates-General, a stance that contributed to the eventual suppression of revolutionary women's political organizations and the execution of de Gouges.

The most famous feminist writer of the eighteenth century was Mary Wollstonecraft Godwin (1759–1797), who also lived in Paris during

the French Revolution. She wrote her celebrated 1792 treatise *A Vindication of the Rights of Woman* in response to revolutionary literature that established universal rights for male citizens of France. Wollstonecraft rejected the patriarchal framework of the church, state, and family, arguing that women should be educated to be strong rational partners for men instead of passive sexual objects. She advocated a national system of coeducational schools to provide an equally rigorous education for both male and female children. Her writings also criticized male economic dominance over women, arguing that the absence of respectable economic activities for middle-class wives made marriage a form of legalized prostitution. Wollstonecraft also challenged the prevailing perception of women as sexually passive, arguing in her 1798 pamphlet *Maria or The Wrongs of Women* that women had strong sexual desires, a stance that generated controversy throughout the nineteenth century.

Women Workers in the Industrial Revolution

The Industrial Revolution of the early nineteenth century entailed both economic transformation and also social and gendered changes. As the first country to industrialize, England quickly gained a reputation for the harsh working conditions endured by women and children in its mines and factories. The reality of working-class women's lives posed a challenge to the middle-class ideal of the "Angel in the House," which posited female delicacy, purity, and exclusion from the male world of work and money.

Many of the earliest industrial workers were immigrants from the English countryside, but the young single women in search of

economic opportunity often found more hardship than success. Like their male counterparts, women workers toiled in factories, textile mills, and mines from 12 to 18 hours a day, six days a week, yet earned only half of a man's wage. Many jobs performed by women, such as those of seamstress or laundress, continued to be done inside the home, usually a poorly lit and unheated one- or two-room apartment, or women sold watercress, flowers, meat pies, and other goods on city streets. Domestic service provided another form of employment for young single women, especially Irish immigrants; these grueling live-in jobs paid even less than factory work but provided room and board (usually a shared bed with another servant in an attic or cellar). The increase in prostitution in the nineteenth century is related to industrialization, as periods of unemployment made it necessary for many women to supplement their meager incomes.

Although the middle class benefited from the cheap labor of the working class, many reformers decried the dangerous conditions of England's factories and mines. Investigative journalists particularly exaggerated the moral conditions of the workplace, with descriptions of lewd language, partial nudity, and sexual misconduct among male and female workers. Such reports prompted Parliament to interview workers during the 1830s and 1840s and pass protective labor laws to limit the hours and types of jobs performed by women. The Factory Act of 1844, for example, limited the number of hours a woman could work a day to 12, and the Mines Act of 1842 prohibited women entirely from mining. However, many forms of employment (especially jobs done at home and on the street) continued to go unregulated. Some families actually resented governmental interference since every wage was necessary for survival, and women often preferred working at night so they could take care of their youngest children during the day.

The married female worker faced a double burden as she tried to balance a long workweek with her domestic duties. Fearful of losing their jobs, married workers, who had on average six to eight children, took little time off between births, leaving infants in the care of their older siblings or neighbors or sometimes drugged and unattended at home. Overworked and malnourished,

➤ WOMEN WORKERS AND THE LOWELL MILLS

The Lowell Mills in Massachusetts recruited large numbers of farm girls from rural New England in the 1830s. Aware of the brutal reputation of the English mills, Lowell promised concerned parents that their daughters would find a safe and protected environment as well as decent-paying jobs in the textile mills. Not only were workers given room and board, but they also were provided with lectures, prayer services, and recreational programs. However, when the mills faced increased competition, the company cut wages, and safety conditions deteriorated. When mill workers went on strike in 1844, they were replaced with cheaper Irish immigrants. Furthermore, the solidarity forged by the young women living together in the Lowell dormitories had fueled their unionizing efforts, prompting the mill owners to require newly hired workers to find lodging in privately run tenements or as boarders with families.

—Julie Taddeo

these women also had a greater risk of complications and dying in childbirth than middle-class women. Male or female, workers were not compensated for injuries suffered on the job, and women, with long hair and breasts that could get caught in machinery, were especially vulnerable.

Early attempts by workers to unionize usually excluded women, since male workers saw them as competitors; indeed, factory owners preferred women because they could pay them lower wages for the same jobs done by men. Additionally, with their lower wages and responsibilities at home, women lacked the time and money to participate in union activity. By the 1880s, however, women were more visible as strikers, such as during the Matchgirls' Strike in London in 1888. These strikers with their yellowed skin and phossy jaw (bone disease caused by overexposure to phosphorus) called attention to the low wages, dangerous conditions, and indifference of employers that persisted late into the century.

Two schools of thought regarding the impact of the Industrial Revolution on women's lives continue to compete. Since Ivy Pinchbeck's 1930 study *Women Workers and the Industrial Revolution, 1750-1850*, historians have debated whether women's lives improved or worsened. For middle-class women who could rely on the cheap and abundant pool of domestic servants to clean their homes and help raise their children, their lives materially improved, and their time was freed to pursue philanthropic, social, and eventually feminist activities outside of the home. However, since these families could now purchase what their women once made, middle-class women did lose a vital economic role within the home. Work became associated with paid labor performed outside the home, part of the public sphere of men. The working-class woman, meanwhile, challenged the dichotomy of public and private, as she labored both in and out of the home for money. Moralists feared that such labor masculinized the so-called weaker sex. Other threats to women's supposed delicacy and purity, traits greatly valued in the nineteenth century, arose as a result of industrialization and urbanization. As women migrated from rural areas to find work, they lost the safety net of kin and community, as the

rise of illegitimate birth rates attests. Still, the lives of working-class women were not simply marked by work and despair. The city afforded them new freedoms and a lively urban culture of pubs, music halls, and working-class solidarity.

Women and the French Revolution

The impact of the French Revolution on the status of women in French society remains widely debated. Women, despite their active participation in the revolutionary events, were no better off in 1804, when the Napoleon Code codified the revolutionary achievements, than when they had been marching to Versailles some 15 years earlier.

When it came to women, the Old Regime was full of contradictions. On one hand, it seemed that never before had women appeared to be so powerful or so sexually liberated. At the royal court and in the numerous salons, women wielded immense influence, and the names of royal mistresses (e.g., Mme. de Pompadour and Mme. du Barry) or society hostesses (e.g., Mme. du Deffand, Mme. du Tencin, and Marquise de Châtelet) remain the most obvious examples. Yet there was also a darker side to this picture. Antifemale prejudice was as strong in the eighteenth century as in any previous age, and the birth of a female child was still not generally considered desirable. Furthermore, convictions about women's inferiority were actively promoted. The ideal woman was thought to be pious and submissive, to accept male (be it father or husband) authority without question, and to spend the greater part of her time praying and attending to her family.

Facing a widespread misogyny, some women expressed their protest and challenged prevailing notions. The monthly *Journal des Dames* became the focal point for female voices

between 1759 and 1778. In the 1780s Marie-Armande-Jeanne Gacon-Dufour's (1753–1835) pamphlets blamed men for the current condition of women, who were forced into arranged and abusive marriages. Many female writers sought to adapt some of the ideas of Enlightenment philosopher Jean-Jacques Rousseau and used his views of femininity to reevaluate women's role as wives and mothers. As a result, on the eve of the French Revolution there were many publications extolling the virtues of motherhood and its role in rejuvenating the nation.

The French Revolution had a profound effect on this discourse, as the leaders of the revolution, who were all males, embarked on creating an entirely new political and social order but failed to consider women's place in this order. Amid heated discussions on the nature of citizenship during 1790–1791, no one gave thought to including women within its definition. Thus, the Declaration of the Rights of Man and the 1791 Constitution granted social and political rights only to males, who were divided into “active” and “passive” citizens based on property requirements. In later years the revolutionary government adopted “universal” suffrage, which was extended to millions of men but once again excluded women, who were automatically considered “passive” citizens due to their gender and alleged inferiority. Such treatment is especially remarkable considering the role that women played in the early stages of the revolution. In Paris, educated women asserted themselves politically and called for reforms to transform their place in the society. Of equal importance was the involvement of poor women in revolutionary events, which the authorities considered of great danger. Indeed, it was these poor women who resorted to “taxation populaire.” Tired of high prices, they forcibly seized goods from merchants and distributed them at just prices determined by popular consent. Furthermore, on October 5–6, 1789, women numbering in the thousands marched and stormed the royal palace in Versailles, bringing the royal family to Paris, which in itself influenced the course of the revolution. The events of the October days are noteworthy for attempts to disguise and minimize the power of women. A government investigation (the Chatelet Inquiry)

claimed that the women who had participated in the march had been bribed and that many of them were not women at all but instead were men in women's clothing.

Failure to gain political and social rights naturally aroused protests from women and some males, who argued for the need to extend social and political rights to women. Marquise de Condorcet famously proclaimed that either no individual had genuine rights or else all had the same rights despite their sex, color, or religion. The most vocal voice of the women's movement was Olympe de Gouges (1748–1793), a Parisian playwright who was unhappily married at the age of 16 and, after the death of her husband, decided never to remarry. In 1791 de Gouges wrote the Declaration of the Rights of Woman as a response to the Declaration of the Rights of Man and Citizen. She accused the revolutionaries of 1789 of appropriating the revolution exclusively for the benefit of males and for oppressing women.

During 1790–1791 women formed several political clubs, with the *Cercle social*, *Les Amies de la vérité*, and *Société fraternelle des patriots de l'un et l'autre sexe*, being the most important ones. They regularly attended and participated in the meetings of the Jacobin and Cordelier clubs as well as section assemblies of Paris. Pauline Léon, Etta Palm d'Aelders, Claire Lacombe, and Théroigne de Méricourt played prominent political roles during 1790–1792. Women often joined protests against new laws (i.e., Le Chapelier Law) that abolished professional and workers' organizations and threatened their livelihood. Despite their pressure on the National Assembly, the women's calls to adopt legislature granting the right to divorce, equal educational opportunities, and regulating women's health remained largely ignored. Nevertheless, women did make some tangible gains. Divorce was legalized in 1792, and legislation allowing women to inherit property was passed in later years.

Female participation in politics increased during 1792–1793, when they exerted great influence in the meetings of Section assemblies of Paris and organized a powerful radical group, *Les Citoyennes republicaines revolutionnaires* (The Society of Revolutionary Republican Women), that united militant women and

supported the Montagnard policies. Its members played a prominent role in the Montagnard ouster of the Girondin government between May 31 and June 2, 1793. However, only a month later a rift opened between the society and the new Montagnard government, which refused to implement the more radical demands of the society. In the subsequent conflict, the government began to crack down on women's involvement in political life. On October 30, 1793, the government decreed that henceforth all women's clubs and associations were illegal. Women leaders were persecuted, and some, including Olympe de Gouges, were executed. Although this largely ended women's involvement in politics, women continued to protest. In February 1795 when state-supported workshops providing jobs to the poor were disbanded and the bread rations were reduced, women organized bread riots in Paris. In response, the National Assembly passed laws requiring women to stay in their houses and stating that groups of five or more women found in the streets would be disbanded by force and held under arrest. The political activism of women thus came to an end. The few gains in women's rights were eventually lost under Napoleon's Civil Code (1804) that limited women's rights and reestablished male authority over them.

It should be noted that not all women favored the revolution. Some rural women saw few advantages in the new political order, which seemed to have undermined their way of life through a plethora of reforms. Furthermore, the revolutionary government's attack on the Catholic Church, which remained influential in provinces, added additional incentive for women to turn against the revolution. Thus, when the government began to force the clergy to pledge allegiance to the state, the mere rumor of such an oath caused a violent protest by women in the small town of Sommières in the south of France.

The Cult of Domesticity in the United States and Britain

Beginning around 1820, middle-class Americans and Britons experienced the emergence of a redefined set of gender roles that effectively and ideologically associated men with the public domain and women with the realm of the home. The public and private spheres, as they came to be known, delineated the proper realms of activity and action for men and women. In this ideology, which held sway until the late nineteenth century, men's activities outside the home were considered vital to the maintenance of his family and to the functioning of business and government. Women's role in the home was similarly elevated. Indeed, women's household activities took on a heightened meaning in the nineteenth century: the cult of domesticity suggested that women's work was entirely essential to the social order. In their domestic role, wives and mothers were expected to act as exemplars of Christian values. Thus, though seemingly confined to the private sphere of the home, women of the period were charged with an important civic responsibility: creating and maintaining the very foundations of civilized society.

The emergence of this ideal of the middle-class family, with a domestically focused mother and a working father, has been linked to the Industrial Revolution. Previously, families comprised independent economic units, but the shift to an increasingly urban industrialized world created new economic and social realities. Families in the nineteenth century were less likely to produce goods for their own consumption than in generations past. Moreover, the emergence of new industrial economic centers spelled a shift

for middle-class families as male heads of household participated in work outside of and away from the home. Men, particularly husbands and fathers, thus began to be associated with the public realm and paid labor while women, who often remained in the home, were linked with the domestic realm and the uncompensated labor of reproduction, child rearing, and home maintenance.

While historians have made clear connections between the emergence of industrialization and the gender division of labor represented by the separate spheres, it is also true that the ideals that undergirded these complementary male and female roles predate industrialization. Christian doctrine, although varied according to denomination, provided a coherent source of information on the basic moral differences between men and women and offered justification for the spheres. Additionally, during the eighteenth and into the nineteenth centuries, Europeans and Americans were increasingly persuaded of the supposed innate biological differences between men and women that helped explain their distinct social roles. In both the popular and scientific imagination, women were supposed to be weaker, more delicate, and less fit for the rigors and dangers of the industrialized world than were men. Yet it was just this delicacy that recommended women for their role in the home: it became women's obligation to create a haven or sanctuary as a retreat from the harsher and potentially corrupting elements of the public world.

Contemporary writers remarked extensively on the emergence of the newly articulated female domestic role. French writer Alexis de Tocqueville (1805–1859) was among those who described the separate spheres in favorable terms, elaborating on the lofty position inhabited by American women who appeared—to him at least—to happily inhabit the domestic realm. Though Tocqueville elaborated on female domesticity as a distinctively American ideal, English writers appear to have been committed to promoting a similar set of prescriptions as well. Writing in the late eighteenth and early nineteenth centuries, for example, the English author and philanthropist Hannah More (1745–1833) argued for the continued education of women so that they might properly fulfill their

role as wives and mothers. In the United States, the educator Catherine Beecher (1800–1878) wrote persuasively about the important civic duty fulfilled by American women. Beecher suggested that the public world of industry and government operated in tandem with the smooth functioning of the private sphere. Popular periodicals promoted this ideal as well: *Godey's Lady's Book* and later *The Ladies' Home Journal* offered practical advice on the efficient governance of the home and provided affirmations on the significance of women's work within it.

Women's historians have been less willing to celebrate the domestic ideology of the nineteenth century than contemporary writers. In the 1960s and 1970s they tended to interpret women's role in the home as limited, confining, and often claustrophobic. Contrasted with the world of paid labor and direct civic agency, the domestic sphere was thought to stunt women's progress. Moreover, historians writing on the subject invoked a pejorative language to describe women's association with the domestic realm. The term “cult” seemed to intimate that women of the period acted as unwitting accomplices in their own subjugation.

Subsequent interpretations of women's role in the period have stressed the extent to which women's position as arbiters of moral values offered justification for a much more expansive role, one that would ironically lead them into the wider world. Beginning in the 1980s, women's historians began to piece together a narrative of a nineteenth-century middle-class women's experience that allowed for the promulgation of domestic values in the public sphere. Middle-class women, these historians argued, began to conceive of themselves not just as uplifters of their families but of society more broadly. Women's function in the home seemed, in this interpretation, to recommend them for much more civically active roles than it might at first have appeared. Historians suggested that middle-class women were emboldened rather than hindered by their moral responsibilities and thus expanded their role in unexpected ways, taking up public roles as temperance advocates, abolitionists, and missionaries.

Though this shifting perspective interrupted the existing historiography by arguing

for and demonstrating middle-class women's agency, historians grew critical of the way in which domestic women appeared to exploit the opportunities presented to them by what was once deemed to be a limited role. Middle-class women, historians began to argue, used their class and racial privilege to export middle-class ideals to men, women, and families in their own country (as in temperance and other reform efforts) and across the globe (as in their work with foreign missions). If middle-class women escaped a closed domestic sphere, they did so at the expense of those they purported to uplift.

Domestic Violence in Europe in the United States

In the nineteenth century in Europe and North America, there were no commonly accepted understandings of the rights of women and children. Wives and offspring, in the strict legal sense, were chattel or property, and as such could be traded, sold, or abused without consequence. Slaves, servants, and prostitutes were often in a similar situation, with violence and abuse being a part of their daily lives. While the infamous "rule of thumb," which allowed a man to beat his wife with a stick no thicker than the circumference of his thumb, is a legal fiction,

many Victorians believed it to be one of the rights men enjoyed over their wives.

Regardless of the etymology of "rule of thumb," wife beating did exist, despite legislative attempts to curtail the practice. As early as the seventeenth century, documents from the Massachusetts Bay Colony stated that "no man shall strike his wife . . . on penalty of such fine not exceeding ten pounds for one offense." In Maryland, in 1882, the punishment for spousal beating was forty lashes at the whipping post.

Some of the most sordid narratives regarding domestic violence can be found in the literature of the nineteenth century. In Charles Dickens's (1812–1870) *Oliver Twist*, the panorama of poverty and the working classes is dramatized through the story of Nancy, the mistress of a criminal, who is beaten and finally murdered by her lover. George Eliot's (1819–1880) novella, *Janet's Repentance*, focuses on the abuse of a lawyer's wife. Elizabeth Cleghorn Gaskell's (1810–1865) writings about the abuse that prostitutes and young women suffered was instrumental in Josephine Butler's campaign to eradicate the survival problems of lower-class women. Thomas Hardy's *The Mayor of Casterbridge* (1886) begins with a drunken man who sells his wife to another man in a drinking house. The great publicist of nonfictional domestic violence was Frances Power Cobbe, whose "Wife Torture in England" (1878) created a public scandal, and eventually led to changes in the law. Court records document those extreme cases that the authorities decided to prosecute, but then, as today, many cases of battering were never reported; hence, there is no way of knowing the actual extent of abuse.

More importantly, husbands, fathers, and male relatives believed that they had a right to "chastise" their wives and children by physical means. It appears that often their wives agreed, as much as they might have lamented it. The origin of this belief comes from a variety of biblical sources, both in the Old and New Testaments. As a source of behavioral modeling and comportment, the Bible dictated gender relationships by naming the man as the head of the household. Statements such as "submit yourself unto your husband," "the husband is the head of the wife," or "the husband shall rule over the

wife,” were claimed to justify men abusing their wives. Women were regarded as children or possessions, and expected to “mind” and “behave.” Marriage vows subtly enforced this biased attitude, and used the word “obey” in the woman’s pledge but not in the man’s. In France, certain parts of the Civil Code conformed to a belief in woman’s connection to sex and sin, derived from the creation myth and Eve’s disobedience. According to one source, Napoleon wanted certain portions of this code to be read by women during marriage ceremonies so that they remained aware of their inferiority and the requirement that they be submissive to their husbands.

In England, a husband could beat his wife and hold her prisoner, provided he did so without cruelty. It is difficult to understand how this could be done without cruelty, but this right to imprisonment remained law until the 1890s. Since divorce was extremely uncommon, economic circumstances forced unhappy marriages to remain intact. During the lifetime of a marriage, conflicts could escalate to the point that “till death do us part” meant murder instead of death by natural cause, although wife murder usually led to prosecution, even if not conviction.

The reasons for marital violence were varied, and although poverty added to the stresses of family life, the upper classes were not immune. The apparent preponderance of domestic violence in the lower classes was because their lives were more transparent. They did not have the means to protect their privacy from public scrutiny and documentation.

It was not until 1878 that the English Parliament passed a law that allowed women to petition the courts for separation on grounds of assault. However, in the nineteenth century, there were few options available for women to survive without the support of a husband. Furthermore, if a woman had an income, her husband could request, through a judge, that it be garnished. No proof was necessary.

Sexual relations in marriage were likewise unbalanced. A man could use violence to force his wife to perform her conjugal duty. There was no such thing as rape in marriage as long as a man used force for what was defined as normal. A woman’s infidelity in marriage threatened

reproductive bloodlines and future distribution of property if she produced a child from that union. A man’s adultery was tacitly acceptable as long as he kept his mistress away from the home he shared with his wife. However, in France, if a man caught his wife in a sexual act and killed her and her partner, he was excused under the “red article” of the French Penal Code.

Some critics of gender inequality, such as Frances Power Cobbe, assumed that wife beating, wife torture, and wife murder did not occur in the upper classes, but J. W. Kaye pointed out that educated and refined men expressed their disregard for women in different ways. The nineteenth century was an important time for changes in gender relationships within marriage. By the turn of the century, the nature of marriage was beginning to evolve from patriarchy to a more companionate character. Those changes were aided by the entry of women into the labor force during World War I and women’s gradual political enfranchisement. Although domestic violence did not disappear, women’s voices were given more agency, as their public presence was validated.

New Professional Opportunities for Women—Nursing, Teaching, Clerical

In the nineteenth century, women in urbanized societies sought new employment in white-collar work and professions that required education and training. With the rise of industrial capitalism and the introduction of compulsory schooling in many European countries, women were eager to compete for jobs newly created by the expansion of the service sector of the economy. The important sites for women's work in this tertiary sector included government offices, banks, post offices, telephone and telegraph exchanges, schools, hospitals, and department stores. Women's entry into nursing, teaching, and office work feminized these fields, also contributing to the dismantling of gender inequalities.

Women's desire and need to work clashed with the prevailing view that most women should make marriage their primary occupation. In France, school curriculum throughout the nineteenth century encouraged girls to prepare for a life of domestic duties, while many boys aspired to university study or skilled work. Yet many women were obligated to work to assist the family economy. Necessity and opportunity led to the doubling of women's participation in

the workforce in Britain between 1851 and 1901. Simultaneously, feminists challenged the ideology of domesticity that sought to limit women to a smaller sphere of society. Europeans gradually came to accept female employees in nursing, teaching, clerical, and office jobs because such work was less well paid and less prestigious than the male-dominated professions such as medicine, law, science, and academia. Moreover, discrimination limited the numbers of women in the higher ranks of all occupations. At the end of the nineteenth century, most governments regulated women's labor, restricting their hours in certain industries to protect women from harm and to enhance men's wages and work opportunities. In the Middle East and Asia, women entered new professions later than in Europe and North America, typically after 1914.

The professionalization of nursing was one of the major developments shaping the medical field and women's job opportunities during the second half of the nineteenth century. Previously, unpaid nursing was performed by family members, religious orders, or charitable institutions. In hospitals, nursing was traditionally associated with manual labor performed by the uneducated working classes. Florence Nightingale (1820–1910) professionalized nursing by elevating it to a scientific and medical practice. The

► THE NEW WOMAN

During the 1890s, the term “new woman” emerged in vocabularies to signify the women who were pursuing lives of their own in a broadening public sphere. In most respects the new type of woman seemed to reject Victorian concepts of home and domesticity by seeking a life independent of marriage, entering previously all-male professions, and pursuing a freer lifestyle. Literary figures mirrored real women's lives as innovators and activists. Playwright Henrik Ibsen's protagonist Nora walked out on her stifling bourgeois marriage in *A Doll's House* (1879) to seek self-actualization. Career women were emblematic of this modern trend. When law graduate Jeanne Chauvin (1862–1926) demanded that the hitherto all-male bastion of the Paris bar admit qualified

women, she stirred up a vociferous controversy about the future of gender relations, work, and family. Her successful entry into the profession in 1900 was rightly seen as a triumph of feminism, while critics warned that women would abandon the home and forsake children, bringing an end to society as they knew it. The modern urban working woman was conspicuous in her convention-defying choices to smoke, ride a bicycle, and wear rational dress, notably pants. While pursuing new fashions in attitudes and lifestyle, women also became participants in an expanding consumer market that fostered desire for individual pleasure and the means of gratification through consumerism.

—Sara Kimble

introduction of her exacting hygiene practices to reduce infections led to the dramatic reduction in preventable deaths in military hospitals during the Crimean War (1854–1856). On the opposing side of this conflict, at least 160 Russian women volunteered as nurses. Nightingale's reforms changed the perception of nursing into a respectable field eagerly pursued by daughters of the educated middle classes.

By the 1880s, large hospitals employed formally trained nurses. The rising popularity of nursing was evident in the British census. In 1851 nurses numbered fewer than 2,300. In 1901 their ranks swelled to more than 25,000. In France, competition between Catholic sisters and lay nurses resulted in a greater proportion of secular staff by 1911. European women also joined colonial missions to provide medical aid while reinforcing imperialism. Whether at home or overseas, nursing remained a low-pay labor-intensive field employing youthful, docile, and unmarried women. During World War I (1914–1918), tens of thousands of women from all warring nations served their country out of a sense of duty, a desire to be useful, and for the promise of adventure. Nursing at the front lines exposed women to the same dangers and hardships as men, and women performed with alacrity and won the respect of the public. Nursing in wartime was seen as a young woman's obligation to the nation, the virtuous counterpart to men's duty in soldiering.

Teaching became a prototypical feminine job with the development of public schools. Teaching was seen as an extension of women's traditional roles as educators and also served as preparation for motherhood. In 1800 few girls entered a classroom, yet by 1914 nearly all attended school if they lived in Northern or Western Europe. At the end of the nineteenth century, women flocked to educational institutions such as Girton College at Cambridge University for advanced study or Sèvres in France for teacher training. American Catherine Beecher (1800–1878) facilitated women's entry into teaching by arguing that their nature suited them to care for youths. By 1907 female teachers held 70 percent of all teaching positions in public primary schools in Italy and Spain. In Britain by 1911, three-quarters of all teachers were female. Teaching was also

an important path for social mobility. In Russia, 40 percent of all female teachers in rural schools came from economically modest backgrounds.

The marriage bar cut short women's careers in teaching in many countries, including Britain, Germany, and Russia. However, France permitted women to continue working after marriage, and the state encouraged married couples to seek positions together in rural schools. Female teachers were typically paid less for the same work until unionization eliminated wage differentials between men and women. In France, female teachers won the right to equal pay for equal work in 1909. Only rarely, however, did women become university professors, such as did the Nobel Prize winning Marie Curie (1867–1934).

The growth of government bureaucracies, an evolution in the nature of white-collar work, and an expansion of educational opportunities for women all encouraged women to enter the tertiary sector. Middle-class women sought respectable and meaningful work in offices, shops, and professions that could provide them with the means to support themselves if they could not or chose not to marry. Female workers could be paid a third to a half as much as men and were subject to paternalistic rules and sexual harassment, but they were less likely to complain about conditions.

Job opportunities for women expanded across the European continent during World War I as men abandoned their jobs for the front. While the majority of women worked in war industries, women broke into other white-collar occupations hitherto closed to them due to exigencies of the war. Women's participation in traditionally masculine work was intended for the duration of the war only. In fact, the war resulted in the long-term destabilization of conservative views of women's abilities and changed young women's expectations for the future.

Under the Russian Empire, women were formally prohibited from working in civil service. However, in the 1880s and 1890s, women found work in minor government positions, banking, and railroads and as office secretaries. Liberal feminists were victorious in bringing about equal employment opportunities and political rights during the Russian Revolution of 1917. By the 1930s, the Soviet Union led the world with

the numerically successful integration of female professionals into all major fields.

Housework

Housework has been a consistent, while often overlooked, aspect of labor history, though its scope and meaning have changed over time. In the eighteenth, nineteenth, and early twentieth centuries housework was mainly undertaken by women, with or without the help of servants, and was centered on three main tasks: laundry, cooking, and general cleaning. Most historians agree that aside from regional variations, housework was relatively static prior to the mid-nineteenth century. Changes occurred during the Industrial Revolution as a result of technological innovation; however, many historians argue that these innovations actually created more work by raising standards of cleanliness. Yet these modifications were not adopted evenly across time and space. Rural dwellers had to wait for proper infrastructure in order to utilize new products, and the poor could not always afford them. For many, modern conveniences were unavailable until the 1920s and 1930s.

Laundry remained by far the most onerous household task well into the late nineteenth century, as few houses had indoor plumbing. Most rural houses received their water supply from wells or streams, and urban residents relied on communal taps. This meant that women had to haul their water before even beginning

to wash their clothing. However, in some areas such as rural France, Ireland, and Scotland, women preferred to construct freestanding washhouses near streams. The washing procedure consisted of forcing the water, mixed with a cleaning agent, through the clothing by beating it, scrubbing it, or even stomping on it. Soap was expensive and rarely used until the mid-eighteenth century. Instead, stale urine, due to its ammonia content, and lye were the main cleansing agents. After washing, linens were given a blue rinse made from powered glass and then were starched before being wrung out and hung to dry. Finally, most clothing and linen had to be ironed with solid irons of varying weights, which were heated on the fire or, later, the stove. Laundry remained a time-consuming and difficult chore until the invention of the electric washing machine in 1914, though innovations such as the wringer and the electric iron did alleviate some of the burden. Consequently, many households chose to send some of their laundry out to a local washerwoman.

In contrast, cooking underwent several changes during this time period. Prior to the mid-nineteenth century the majority of cooking

› SPRING CLEANING

The term “spring cleaning” has a historical basis. When houses were heated by a central fire pit or stove and lit by rush lights, candles, or lamps, soot and grime accumulated throughout the winter months. When spring finally arrived the household was turned upside down, as carpets were pulled up and beaten outside and the underlying floor was swept and the tacks cleaned. Curtains were taken down and washed, walls were wiped down, furniture was polished, and the house was generally aired out. Even individuals not directly involved in this endeavor had to put up with missed meals, blocked-off rooms, and exhausted housewives and servants. However, spring cleaning was also a relief, as it heralded the warmer weather; the return of laundry drying outside instead of inside, where it dripped onto the heads of the inhabitants; and a return of privacy, as the household no longer had to crowd around light and heat sources.

—Heather Stanley

was done over an open fire in a central room that also served to heat the home. In both the United States and Europe the range, which usually consisted of a cast iron grate and various trivets to support pots, became popular around the 1830s, though these were quickly replaced in the United States by the closed stove, heated by wood or coal. Keeping these lit and clean was a time-consuming task. These stoves were less popular in Britain, where gas cooking became widely available in the late nineteenth century. Rural women often blurred the edges between housework and paid work by caring for chickens and dairying, which might feed the household or be bartered or sold for other goods. Even in urban areas making meals was a labor-intensive task because, for example, chickens were usually sold unplucked, and flour had to be sifted for impurities.

Before the advent of the vacuum cleaner in the 1900s, most general cleaning consisted of cleaning the hearth, dusting, cleaning the floor either with a broom or by strewing wet tea leaves or sand on carpets to pick up the dust, and cleaning the pots and pans with sand or salt. As with laundry, improvements were slowly introduced for cleaning through the advent of indoor plumbing and commercially prepared soaps. These developments as well as public health concerns did cause the levels and expectations of cleanliness to steadily rise during this period. However, the kind of weekly cleaning that would become expected in the post-World War II era was still uncommon.

Feminist Movements in the United States

The origins of feminism in the United States can be traced back to the end of the eighteenth century, when a number of women began to question the social, political, and cultural norms that determined their lives in the new republic. In the decades that followed, women, with some male support, worked to expand women's rights, at first in regard to educational opportunities and family roles and subsequently in the area of politics. This so-called First-wave Feminism lasted from the late eighteenth century to 1914 and prepared the groundwork for Second-wave Feminism, which in the 1960s and 1970s sought to end discrimination against women in areas related to sexuality, family, the workplace, and reproductive rights. This was followed by Third-wave Feminism, a term that is applied to several diverse strains of feminist theory and activity that emerged in the 1990s and are viewed as reactions to perceived failures of Second-wave Feminism.

During the American Revolution women played key roles as both patriots and loyalists, but despite their contributions, they were denied political rights once independence had been achieved. In the early 1800s prevailing attitudes redirected women's political and patriotic tendencies away from their more public roles taken on during the revolution in order to reinforce their roles as wives and mothers. The doctrine of Republican Motherhood emphasized the need for women to remain in the home and educate their sons and daughters on how to be effective citizens and good Christians in the newly formed republic. Such a role required that women receive an education, and indeed literacy rates for women increased markedly in the first half of the nineteenth century. But it also narrowed the boundaries of women's lives.

In the late eighteenth and early nineteenth centuries, several influential writers published works that became cornerstones of First-wave Feminism. *A Vindication on the Rights of Woman* (1792), written by Englishwoman Mary Wollstonecraft, had many American readers. It argued that women's perceived inferiority was not inherent but instead resulted from a lack of

SOJOURNER TRUTH AND THE QUANDARY FOR WOMEN OF COLOR

Like many in the women's rights movement, Sojourner Truth, a former slave, worked to end slavery and to expand women's rights. Her best-known speech—"Ain't I a Woman?"—delivered in Akron, Ohio, in 1851 encapsulated the continuing issue over the involvement of African American women within the various women's movements. In it she questioned the treatment of African American women in general and within the movement specifically. Sojourner Truth, like many of her counterparts, faced dual systems of oppression due to her race and gender. The question of place within the movement for those facing multiple systems of oppression remains unresolved to the present day and became a major issue during Third-wave Feminism.

—Jennifer Janson

(Norman Barton Wood. *The White Side of a Black Subject: A Vindication of the Afro-American Race, from the Landing of Slaves at St. Augustine, Florida, in 1565, to the Present Time*).

education. She forcefully argued that both sexes should be treated as rational, thinking beings capable of reason and full participation in society. Judith Sargent Murray, the American counterpart to Wollstonecraft, wrote the essay "On the Equality of the Sexes" in 1790 in which she also argued for equality between the sexes based on intellectual capability. Margaret Fuller's *Woman in the Nineteenth Century* (1845) was another important American feminist work. Fuller, a journalist who was editor of the transcendentalist magazine *The Dial* and a writer for the *New York Tribune*, compared women's lot to that of slaves and called for a new awakening in which women would be considered the intellectual and spiritual equals of men.

Such writings provided the background for the first women's rights convention, which was organized by Elizabeth Cady Stanton and Lucretia Mott and took place in 1848 in Seneca Falls, New York. Delegates produced the "Declaration

of Sentiments," inspired by the Declaration of Independence, that outlined the rights to which women were entitled, including the vote. In the decades that followed many feminists, including Stanton, Mott, Susan B. Anthony, and Sojourner Truth, worked for the vote, but women were also involved in other reform efforts focusing on temperance, the abolition of slavery, improved education, and better health care. The slow pace of reform in these areas strengthened the conviction among women that in order to create real change in American society they needed the vote.

The movement for women's rights was temporarily suspended with the American Civil War. When the war ended, disputes within the movement led to an ideological split in the American Equal Rights Association, which had been formed in 1866 to advocate for a constitutional amendment to guarantee the vote for blacks and women alike. In 1869 it split into two groups. The National Woman Suffrage Association (NWSA)

opposed the Fifteenth Amendment (which guaranteed blacks the right to vote) because it failed to give women the vote and also advocated for reform of divorce laws and the end of discrimination in matters of work and pay. The less-militant American Woman Suffrage Association (AWSA) was founded by staunch abolitionists who feared that the Fifteenth Amendment would be defeated if it included a provision on women's voting rights. They avoided issues other than gaining the vote for women, which they believed could best be achieved on a state-by-state basis rather than by a constitutional amendment. In 1890 the two groups reconciled and joined forces as the National American Woman Suffrage Association (NAWSA). Under the leadership of Susan B. Anthony, the NAWSA oversaw the work of hundreds of smaller local and state groups that supported woman suffrage legislation in their states and communities. It was the most important suffrage organization in the United States and was instrumental in winning the ratification of the Nineteenth Amendment to the U.S. Constitution in 1920. With the achievement of this long-sought goal, First-wave Feminism in the United States came to an end.

Feminist Movements in Europe

Feminism is the critical response to the systematic subordination of women as a group to men as a group within a given cultural setting.

A feminist believes that men and women should have equal rights and opportunities. The word *féminisme* emerged first in France in the 1870s, yet the goal of righting the imbalance of power between the sexes dates from centuries earlier.

As early as the fifteenth century, writers defended women's equality and called for ending women's subordination in the family, law, and society. The Venetian-born French writer Christine de Pisan (1364–1431) authored a political treatise, *The Book of the City of Ladies* (1405), in which she condemned the demeaning remarks made about women by ancient authorities, such as Aristotle and Ovid, and defended women's capacity for intellectual achievement and their right to govern. Important humanists viewed women as spiritually equal to men, and the Cartesian theorist François Poulain de la Barre (1647–1723) pushed this notion into the secular sphere by arguing that "the mind had no sex." Enlightenment philosophers from Sweden to Spain engaged in rich intellectual debates about gender roles and developed a literary movement on the "woman question." While many authors denounced women's subordinate existence, others, most famously Jean-Jacques Rousseau (1712–1778), developed an antifeminist resistance by denigrating women and prescribed for them a limited sphere of action in domesticity. The patriarchal worldview that women were uniquely suited for the private realm profoundly influenced European social structures during the nineteenth century.

The French Revolution was an extremely important moment for the rise of a popular movement for women's rights. In France, women's activism existed alongside men's activism. However, women's activism made monumental impacts at particular moments, including the march in October 1789 when women brought the king to Paris, in 1793 when women protested for political rights, and during the insurrections of May 1795. The revolutionary government recognized women's civil rights but not their civic rights, permitting women equal inheritance and divorce rights but excluding them from political rights. A former actress turned writer, Olympe de Gouges (1748–1793), enumerated the universal rights that belonged to women, including property, taxation, and citizenship, in her *Declaration of the*

► FAMILY PLANNING IN LATE-NINETEENTH-CENTURY EUROPE

Family planning was one of the most controversial issues in late-nineteenth-century Europe. At a time of declining birthrates, most governments criminalized birth control devices, contraceptive information, and abortion in the interest of encouraging larger families. Critics equated contraception with obscenity and the encouragement of promiscuity. Christian churches and the medical establishment likewise opposed any artificial controls of fertility. Consistent with the double moral standard, most governments regulated prostitution as a necessary outlet for men's licentious nature.

In Britain from the 1820s onward, anyone who published pamphlets about methods to prevent pregnancy ran the risk of prosecution under obscenity laws. Contraception became a public issue in 1877 when Charles Bradlaugh (1833–1891) and Annie Besant (1847–1933) were brought to trial for one such publication. Their guilty verdict led to the creation of the British neo-Malthusian

League that advocated family planning and eugenics. By 1882, the pioneering Dutch female doctor Aletta Jacobs (1851–1929) opened the world's first birth control clinic. Working with poor patients, Jacobs witnessed the physical toll and poverty associated with too-frequent pregnancies. Believing that abstinence was impracticable, she began fitting women with diaphragms developed by German physician Wilhelm Mensinga. In France, Nelly Roussel (1878–1922) touted the health and social benefits of smaller families in her national lecture tours. The most radical campaigns were in Germany, where Helene Stöcker (1869–1943) founded the German League for the Protection of Motherhood in 1905. This group uniquely criticized the double standard of sexual morality, supported sex education, and called for the end of state-regulated prostitution and the decriminalization of abortion.

—Sara Kimble

Rights of Woman and Citizens (1791). Revolutionary women could count on a few supporters such as the Marquis de Condorcet (1743–1794), a mathematician and philosophe, who condemned sex and race discrimination as an injustice. De Gouges and other women's rights leaders were put to death by guillotine for their ideas. After the radical pamphleteer Thomas Paine (1737–1809) called for individual rights based on capacity to reason rather than property, British author Mary Wollstonecraft (1759–1797) claimed women's rights on the same basis in her essay *A Vindication of the Rights of Woman* (1792). Wollstonecraft championed the most acceptable feminist ideas that women needed education and economic opportunities to aid their families and live with dignity.

The counterrevolution and the rise of Napoleon ushered in a culturally conservative era that narrowed the vision of women to that of subordinate wives who owed obedience to their husbands under strict laws. The dominant politics of liberalism left a conflicted legacy, as liberal ideas legitimated challenges to traditional authority and served to enfranchise men but denied women's claims to citizenship on the

basis of sex differences. In the early nineteenth century, married women had no legal right to property or to their earnings; no freedom of movement or conscience; no freedom regarding their bodies; and no rights in regard to their children. Feminists criticized the laws that stripped women of their basic rights, and they objected to additional regulations that prohibited paternity suits, required women to take their spouse's nationality, and decreed adultery a crime only if committed by wives. Reformers Josephine Butler (1828–1906) in Britain and Hubertine Auclert (1848–1914) in France argued that under such laws matrimony more closely resembled slavery rather than the ideal of companionate love as described by romantics. Writer Caroline Sheridan Norton (1808–1877), falsely accused of adultery by her drunken husband and denied custody of her children, published critical pamphlets and thus helped secure a series of legal improvements achieved by parliamentary acts. Married women's property rights followed in England (1870), Germany (1900), and France (1907), primarily benefiting bourgeois women.

Mainstream feminists hoped to ameliorate women's condition and to remake society

according to their values. As legal and social distinctions drove a wedge between men's and women's roles in the family and society, women became increasingly associated with all that was civilized, spiritual, and moral. Activists, organized into solidarity groups, utilized the perception of women's domestic virtue to justify moral reformation in the outside world. Women joined political campaigns to abolish slavery and prostitution. They formed temperance associations to end the abuse of alcohol and condemn male domestic violence. Other feminists concerned with the condition of the working classes called for labor regulations to protect pregnant laborers and new mothers and end exploitation. The global nature of these concerns and the technological advances in travel and communication led to the growth of international associations such as the International Council of Women. Many reform objectives were successfully achieved piecemeal and gradually during the twentieth century.

The repeated appeal for women's voting rights punctuated modern history, often corresponding with democratic reforms. Many male and female feminists came to see political rights as the key to achieving all their goals. In 1848 French utopian socialist and working-class journalist Jeanne Deroin (1805–1894) demanded that the provisional government grant women suffrage rights, for which she was thrown in prison. Under a less-repressive regime, moderate republicans Maria Deraismes (1828–1894) and Léon Richer (1824–1911) cofounded a French society for women's rights to secure an equal share of rights and liberty for women. Deraismes, a persuasive writer, argued that women's inferiority was not a fact of nature but “a human invention and a social fiction.” In Britain, Barbara Smith Bodichon (1827–1891) and her allies gathered signatures for a voting rights petition in 1866 that Liberal members of Parliament John Stuart Mill and Henry Fawcett presented to the House of Commons. This act began a decades-long effort for suffrage dominated by the peaceful methods of the National Union of Women's Suffrage Societies. In 1905 Emmeline Pankhurst (1858–1928), leader of the Women's Social and Political Union, urged “deeds, not words,” and spearheaded a militant campaign

characterized by civil disobedience and hunger strikes.

In Germany, where women were prohibited from attending political meetings, cautious leaders, including Louis Otto-Peters (1819–1895), initially focused on moderate demands for education and economic rights rather than the vote. The German women's movement was divided over class issues, whereby socialist leaders such as Clara Zetkin (1857–1933) espoused the belief that only the overthrow of capitalism could emancipate women. Women's suffrage was granted more readily in countries with less-divisive women's movements including Finland (1906), Norway (1913), and the Soviet Union (1917). Over 20 nations granted women the right to vote after the First World War (1914–1918), partly in recognition of women's wartime patriotism. With few exceptions, formal constitutional equality for women hung in abeyance until after the Second World War (1939–1945).

European Women and Imperialism

In recent decades, historians interested in a wide range of subjects have shown that European imperialism was not solely a masculine affair. Conceptually and in practice, women were at the heart of the imperialist project. The gendered social dynamics of European societies provided Europeans with models and metaphors for their relationships with foreign lands and their peoples. Empires and their constituent parts were regularly represented by Europeans in gendered terms, while imperial projects were commonly depicted as masculine adventures involving the domination of female virgin territory. At the same time, European women were both physically and intellectually fully involved in the accumulation and management of imperial possessions. European women were actively engaged in the processes of building and reorganizing empires in a variety of roles: as wealthy and influential investors in imperial ventures; as authors, artists, and social scientists involved in studying and representing their empires' subjects; and as missionaries, colonists, and sight-seeing travelers.

Between the mid-eighteenth century and the beginning of World War I, people from all parts of Europe became involved in extracontinental imperialist ventures. Older empires such as those of the Portuguese, Spanish, Dutch, French, and British continued to offer opportunities and challenges to the men and women who managed them throughout this period. By the end of the nineteenth century a wide range of other European nations, most notably Belgium, Germany, and Italy, were working to carve out imperial holdings overseas, a process that was perhaps best illustrated by the unrestrained scramble for Africa at the turn of the twentieth century. Even regions of Europe that were not engaged in building empires of their own during this period saw emigrants departing for overseas destinations in the hope of finding better lives. The European mass emigration, colonization, and imperial domination of other parts of the world during these years touched the lives of women at all levels of European society.

The well-entrenched separate spheres of work for men and women in European cultures meant that women were not expected to perform the same functions as men within the imperial context. Typically, women were

▶ ELLEN JOYCE

Almost 50 years of dedicated service to the British imperial cause had earned Ellen Joyce the prestigious titles “Lady of Grace of the Order of St. John of Jerusalem” and “Commander of the British Empire” by the time of her death in 1924. Joyce stands out as a particularly ambitious, energetic, and effective female imperialist, but she was far from alone in her work for empire, which involved promoting and facilitating the emigration of thousands of British women to colonial destinations over the course of the late nineteenth and early twentieth centuries. Like hundreds of other middle- and upper-class British women, Joyce worked as a private individual and as a member of women's organizations to feminize an empire that she saw as both glorious and in desperate need of women's civilizing influences. The photograph of Joyce featured here is situated in a page taken from the golden anniversary history of the Girls'

(The Women's Library)

Friendly Society, an imperially oriented society for the encouragement of purity, humility, and religiosity in working-class girls. Joyce served as the primary figure in this society's Emigration Department from 1883 and as the president of the British Women's Emigration Association until 1919.

—Lisa Chilton

underrepresented in the ranks of Europe's imperial power brokers. Yet as members of their societies' elite, individual women could play important roles in the formation of their nations' imperial agendas. Queen Victoria's assumption of the title "Empress of India" serves as a striking example of a woman's personal and symbolic engagement with imperial authority. Less ostentatiously and by a wide range of means, hundreds of wealthy and socially influential women took it upon themselves to determine the workings of particular aspects of their nations' empires. For example, by the end of the nineteenth century, organizations such as the Girls' Friendly Society, the Imperial Order Daughters of the Empire, the Victoria League, and the British Women's Emigration Association had established links between imperially minded women throughout the British Empire. Likewise, although women were less likely than men to work as natural scientists or geographers in the imperial context, large numbers of women engaged in the collection, classification, and dissemination of information about newly discovered environments overseas. Where European women were expected to play a significant part in empire making was in the production of the next generation of white colonials and in the realm of cultural imperialism. The arrival of white women in the colonies was typically heralded by colonial authorities as a sign of advancement. Their presence was expected to improve the moral conditions of colonial communities generally, while their availability for marital partnership with white males was celebrated as a cure for the problem of growing mixed-race populations. White women were heavily involved as missionaries and educators and by personal example in the Christianization and acculturation of colonized peoples. They were also assigned the task of ensuring that white men would remain true to their own so-called superior racial and cultural identities. White women were seen as a bulwark against white men's tendency to "go native" when left to their own devices in areas dominated by aboriginal peoples.

The relationships that were established between European women and colonized peoples varied widely depending upon the sociopolitical

contexts and the personalities of the people involved. As the employers of relatively powerless workers, European women could have a huge impact on the quality of life of colonized people. The most common employer-laborer relationship that European women experienced was that of mistress to domestic servants. In the European context (and in some Europeanized colonies), these relationships were typically between white women of different classes. When the servants were not Europeans, these relationships were complicated by socially and institutionally recognized racial hierarchies. In certain colonial contexts, such as in India and parts of Africa, where servants might more commonly be men, the mistress-servant relationship was further complicated by differences of gender. The mixed-gender dynamics involved in these mistress-servant relationships could result in significantly different cultural power relations.

Violence (especially sexual violence) perpetrated against white women by nonwhite men was used extensively in propaganda designed to strengthen the hands of states involved in imperial conflicts. Likewise, in various locations ranging from India to Southern Africa to North America, incidents in which white women were harmed or threatened by men of color were used to justify laws restricting the rights of colonized peoples and to excuse colonials' acts of violence against indigenous populations.

European women experienced empires differently depending upon their class, their relationships with the men around them, and their sociopolitical contexts. European women could venture out into the extra-European imperial world as indentured, impoverished, uneducated domestic servants or as the much-pampered wives and daughters of colonial governors; being a woman of European background in Haiti at the end of the eighteenth century would have resembled being a woman of European background in eastern Canada at the beginning of the twentieth century in very few respects. For some women, the reality of European empires provided wonderful opportunities to explore, to grow, and to achieve measures of freedom and independence unavailable within the much more conservative, traditional European contexts. For other

women, life in the context of shifting imperial powers meant round after round of violence and uncertainty.

Feminism in Latin American Societies

Prior to independence, women in Latin America found little opportunity for intellectual or economic advancement. Although women participated in a wide range of economic activities, social mores kept them subordinate. The Catholic Church provided the only female organizations as well as the only opportunities for women to pursue advanced learning. These limitations conformed to the ideal known as *mari-aniso*, which limited female activity to the home and upheld patience, circumspection, and self-sacrifice as feminine traits.

Following independence, most nations in the region created new opportunities for women. Partly out of imitation of the United States and partly out of a desire for a more secular society, the new governments promoted education for both men and women and created new organizations to take over duties previously performed by the Church. These efforts included hiring foreign teachers in order to train women

CECILIA GRIERSON

(Archivo General de la Nación, Argentina)

In 1889, Dr. Cecilia Grierson (here photographed in 1914) became the first woman in Argentina to receive a medical degree. In 1900 following her visit to the International Council of Women meeting in London, she cofounded the Argentine National Council of Women, the first organization of its kind in Latin America.

—Gregory Hammond

as educators and the creation of national charitable organizations such as Argentina's Beneficent Society, which operated schools, hospitals, and orphanages throughout the nation. Education and the chance to be active in society beyond the boundaries of church and home resulted in individual feminists making themselves heard in the second half of the nineteenth century. These activists, inspired by European and American feminists, advocated civil and workplace reforms designed to improve the status of women. Gradually, women began to enter into professions such as medicine and law, which had once been exclusively male. Teaching became an especially popular career for middle-class women.

The combination of arguments of female intellectuals and new economic trends forced a serious discussion regarding women's issues. In the late nineteenth century, the Industrial Revolution began in Latin America, and as in Europe and North America, women joined the urban workforce in large numbers. This influx of women contributed to the overall political and

social upheaval associated with the urbanization of the early twentieth century. New political parties and labor unions as well as the Catholic Church all sought to incorporate women into their activities. These organizations differed philosophically but tended to share certain principles concerning women. They all agreed that modern society threatened women with denigration and abuse, that women's role as mothers made them morally superior beings, and that in order to prevent abuse and safeguard the maternal role, society had to provide special protections for women. Feminist organizations that emerged in the midst of the political upheaval of the early twentieth century shared these principles. However, feminists interpreted the maternal role in an expansive rather than a restrictive way that encouraged women to enter the public sphere beyond the home and thus improve public morality. Only a handful of women, such as those associated with anarchism, sought a radical reorganization of gender roles.

The turn of the century saw the emergence of new women's organizations that combined the innovation of the intellectual feminists and the organizational know-how of established female organizations. These new bodies forged ties to international feminist groups while adjusting feminist arguments to local conditions. Women's suffrage, for example, was not a priority for Latin American feminists. Instead, they addressed the civil code structure of their nations that relegated married women to the legal status of minors. In addition, Latin American feminists, like their counterparts abroad, tackled a variety of social issues, including educational reform, public health, vices such as alcoholism, and workplace protection. Women's groups approached these issues through a combination of direct community action (such as adult education classes) and lobbying. In this way, they gained political experience that served them well in later years. In the short term, however, they achieved only limited success, due in part to ideological, racial, and/or class fragmentation and to persistent reticence, if not outright refusal, on the part of male politicians to acknowledge women's issues.

By the beginning of World War I, women in Latin America had laid the basis for expanded civil rights. Although many of their goals were

still unrealized, they had achieved some short-term gains, particularly in education and workplace reforms. They had also demonstrated that they could enter the previously all-male sphere of politics without damaging their femininity.

Sex in Enlightenment Thought

The Enlightenment thinkers challenged Christian Europe's prevailing sexual order with a secular and positive view of sex, yet most were conservative in supporting male domination and emphasizing that the purpose of sex was procreation.

For the Enlightenment thinkers, sexual desire was not sinful lust but instead was natural and praiseworthy. Enlightenment thinkers rejected traditional Christian suspicion of sex, particularly the Catholic tenet that celibacy indicated spiritual superiority. However, most Enlightenment thinkers did not believe in unfettered license but instead believed that sex should be regulated, not by the Bible or the Church but by nature's laws. Although some Enlightenment thinkers took a tolerant attitude toward different sexual behaviors, belief in natural law often entailed rejecting not only celibacy but other sexual practices considered unnatural, because they were unprocreative. Many Enlightened thinkers including Voltaire and Immanuel Kant endorsed the violent hostility to masturbation that emerged in eighteenth-century Europe. Champions of the Enlightenment also employed homophobic attacks on their enemies, particularly the Jesuits and other religious orders. Another reason that celibacy was blameworthy, in this view, was that it fostered same-sex relations.

Adopting a more positive attitude to sexuality was part of the Enlightenment program of social reform. Such new attitudes, they believed, would have beneficial social consequences. Many Enlightenment thinkers, particularly in France, believed that their society was underpopulated. Sexual repression, particularly in the institutionalized form of celibacy, contributed to this problem. Celibates were parasites on society in their refusal to participate in the creation of the next generation. Celibacy was much more an issue for the Enlightenment in Catholic countries such as France, with their legions of celibate priests, nuns, and monks. It was much less discussed in Protestant countries, where celibacy had much less presence. Abolition of celibacy and the acceptance of sex as a natural phenomenon would lead to an increase in population, thus strengthening the state. Some, such as Benjamin Franklin, also advocated abolition of the stigma against unmarried mothers for the same reason. Franklin's satire "The Speech of Miss Polly Baker" (1747), whose heroine had borne five children out of wedlock, was popular in France as well as America.

Enlightenment philosophers also emphasized the positive role of sex and relations between men and women in creating and sustaining human society. Sociability was an important Enlightenment value. (Enlightenment belief in sociability was also another reason for rejecting masturbation, which was viewed as not merely unnatural but antisocial.) Scottish writers such as William Robertson, who were particularly interested in the development of society, credited the refinement of sexual attraction as an important force in the civilizing process.

Enlightenment thinkers usually did not challenge the traditional male dominance in society, marriage, and the law. They did not root male dominance in divine law but rather in the naturally different functions of the genders. Woman's natural function was domestic, as a wife and mother, while man's was public. Sexual desire was as natural and praiseworthy for women as it was for men, particularly since sex led to motherhood, but although many male Enlightenment thinkers had affairs with married women and showed some sympathy for women trapped in unhappy marriages, few questioned the double

➤ DENIS DIDEROT AND THE MYTH OF TAHITI

Denis Diderot (1713–1784), a leading writer of Enlightenment France, vigorously attacked the sexual hypocrisy and repression of European society. Diderot's *Supplement to the Voyage of Bougainville* (1772) paints a picture of Tahiti as a utopia of sexual freedom, contrasting the Tahitians' frank acceptance of sex with the repression and hypocrisy of European visitors who bring both sexual shame and sexually transmitted disease. Diderot even endorses intergenerational incest, particularly if a father begets children with a daughter too ugly to attract men. Yet for Diderot and his fictional Tahitians, sex is largely valuable because it leads to the conception and birth of children. The Tahitians frown on sex with women who cannot conceive, and sterile or menstruating women wear particular clothing to indicate their sexual unavailability. Sterile women who have sex are punished. So radical was Diderot's *Supplement* that during his lifetime it circulated only in manuscript form to his closest friends.

—William E. Burns

standard that oaths of marital fidelity are more binding on wives than on husbands. Female philosophers such as Mary Wollstonecraft were often more distrustful of the Enlightenment's emphasis on sexuality. Wollstonecraft believed that the reduction of women to their sexual functions was central to the oppression of women in society. An overemphasis on sex made women into flirts and men into sexual predators. Wollstonecraft believed that marriage should be based on mutual friendship rather than sexual attraction. Jean-Jacques Rousseau, in contrast, believed that sexuality in a civilized society, as opposed to the animal-like sexuality of the state of nature, illegitimately shifted power to women, as it allowed them to manipulate men.

To challenge harmful ideas about sex, sexual matters had to be openly discussed. The writings of many Enlightenment philosophers such as Diderot were sometimes censored for that reason. Pornographic books circulated along the same distribution networks as the works of the Enlightenment and were also referred to as "philosophic books." Some Enlightenment writers

were also pornographers. Diderot, for example, was imprisoned for his pornographic work *The Indiscreet Jewels*. Late-eighteenth-century pornography often drew upon Enlightenment secularism and materialism, most notably in the works of the Marquis de Sade.

Homosexuality

It is generally accepted that in all societies and centuries people have engaged in sexual activities with other people of the same sex. The way these activities have been conceptualized and to what degree they have been considered part of normal sexuality or, in contrast, excluded from it has changed many times. The current use of the term “same-sex sexuality,” which is supplanting homosexuality in Anglophone academic discourse, is an example of the endlessly shifting understanding of sexual practices different from what are considered those of the majority of people.

In 1869, when the word homosexual was coined in German by the Austro-Hungarian Karl Maria Kertbeny, one could already make out a number of conceptualizations of same-sex desire or practices, which complemented and extended the religious notion of sodomy. The nineteenth century was profoundly marked by legal and psycho-medical discourses on deviant sexuality brought about in large part by the after-effects of the Enlightenment and the Industrial Revolution. Bénédict Morel’s *Traité des dégénérescences* (Treatise on Degeneration), published in 1857, formed the foundation for later theories that associated all forms of deviant sexuality with hereditary decay. By linking physical stigmata to all mental disorders, Morel, like his fellow French

medical doctor and forensic expert Auguste-Ambroise Tardieu, paved the way to the notion of same-sex desire as the obvious consequence of an inherited sexual pathology.

This notion achieved its logical conclusion in the view put forward by the German legal official Karl Heinrich Ulrichs, who in 1864 coined the term Urning (in English, Uranian), a reference to Aphrodite Uranus and the praise of Uranian pederasty in Plato’s *Symposium*, to proclaim the existence of a third sex distinct from the male and female. According to Ulrichs, members of the third sex desired men because they harbored a female soul in a male body. As sociologist David F. Greenberg argues, Ulrichs’s writings were the first in the modern era to systematically link same-sex attraction as a hereditary trait with cross-sex identification. However, although Ulrichs’s formulation concerned an alleged third sex, only the body lent itself to ambiguity; desire was clearly constructed as a bipolarized attraction between a “male self” and a “female self,” albeit inverted in the case of the Uranian. Yet, despite its negative conceptualization of same-sex desire as an inborn mistake, this definition, in a way, could carry a highly positive connotation since it puts same-sex desire on an equal footing with opposite-sex desire, both being natural phenomena.

In 1869, Carl Westphal described same-sex desire as *conträre Sexualempfindung*, contrary sexual sensation. Westphal defined same-sex desire as deviant from what custom expected as desire—the attraction of opposites—and linked it with deviant sexual identity. Westphal’s and Ulrichs’s definitions of same-sex desire and transgender identification as pathology and not as vice must be read in the light of the legal situation in Germany during their time. In France, the Napoleonic code made no mention of same-sex activities after the French Revolution. Accordingly, it made no difference whether same-sex desire was a vice or a congenital illness, since in neither case could it constitute a cause for legal regulation. In contrast, Ulrichs and Westphal lived under the antisodomy laws existing first in Prussia and, in the aftermath of the Franco-Prussian war of 1871, in Germany. Both Ulrichs and Westphal, who might have wanted to define same-sex desire as pathological in the beginning in order to

► KEY EVENTS IN THE HISTORY OF HOMOSEXUALITY

- 1778—Baron Friedrich von Steuben, one of the great military strategists of the eighteenth century, is dismissed from the U.S. military service for engaging in sodomy with Lieutenant Gotthold Frederick Enslin. The event might be considered the first instance of the U.S. military's dismissal of a member of the armed forces for homosexual behavior.
- 1786—Pennsylvania removes the death penalty as a punishment for sodomy. By the end of the century, a number of other states had followed suit in reducing the penalty for sodomy.
- 1861—Civil laws against homosexual acts among men are abolished in England and Ireland.
- 1869—The Hungarian physician Karl Maria Kertbeny coins the word homosexual.
- 1885—The British Parliament recriminalizes all male homosexual acts in both public and private.
- 1896—Adolf Brand, German writer, anarchist, and gay rights activist, publishes the first edition of *Der Eigene* ("The Community of the Special"), the first periodical dealing with issues of homosexuality. Publication is eventually shut down in 1931 by edict of Adolf Hitler.

- 1897—Magnus Hirschfeld, Max Spohr, and Erick Oberg found the Scientific-Humanitarian Committee in Germany. It is the first association in the world to campaign for social and legal recognition of lesbians, gay men, and transgendered persons.
- 1897—Havelock Ellis, English physician, social reformer, and sexologist, publishes *Sexual Inversion*, generally regarded as the first serious book to treat homosexual behavior as a normal variant of human behavior rather than as a crime, a disease, or a sin.
- 1908—Edward Carpenter, English poet, social activist, gay rights proponent, and philosopher, publishes *The Intermediate Sex*, arguably his most influential book on gay issues.

exempt it from these laws, concentrated on gender identity rather than on behavior.

In 1878, the Italian forensic doctor Arrigo Tamassia took a similar path to Westphal's in his attempt to name same-sex desire. While his translation of *conträre* as *inversione* was slightly off the mark, it emphasized homosexuality as a distorted gender identity. The French neurologists Jean-Martin Charcot and Valentin Magnan took up Tamassia's terminology and rendered it into French as *inversion du sens génital*, inversion of the genital sense. Yet, while the word inversion recalls the idea of contrary sexual sensation, Charcot and Magnan were actually at variance with Westphal and other German-speaking theorists who diagnosed same-sex desire as pathology distinct from other supposed perversions. The two French scientists instead fitted same-sex desire into a general theory of degeneration. By clinging to the concept of inversion they failed to differentiate preference for people of one's own sex (sexual orientation)

from identification with the opposite gender (transgender identification). This changed with the growing currency of the term homosexual. Through references especially in the German neuropsychiatrist Richard von Krafft-Ebing's *Psychopathia Sexualis* (1886), this term became widely accepted, first in the German-speaking world and later on everywhere in Europe, to describe those who have sex with or are sexually attracted to people of their own sex.

Thus, the earlier contrast between prohibited immoral genital acts and deviant desire is increasingly replaced by a discourse where human identity itself becomes radically enmeshed in sexuality. This theory of homosexuality and object choice was continued in Sigmund Freud's psychoanalysis. While Freud avoided any moral condemnation, he nevertheless considered same-sex desire an arrested state of the normal development from polymorphous sexuality toward the ideal, if imperfect, state of adult heterosexuality. In other words, a psychic accident

occurs in the individual's evolution from primitive pansexuality to civilized heterosexuality.

Because Freud did not view homosexuality as a hereditary illness or group inverts among the degenerates, his claims mark an important break from the tendency to pathologize homosexuality. Yet at the same time, Freud's Oedipus and castration complexes were profoundly heterocentric. Although he allowed for polymorphous sexuality in early childhood, the process of maturation should preferably lead to the ultimate goal of heterosexual desire, in which nonprocreative impulses have been largely repressed. Homosexuality was therefore partly congenital and acquired in Freud's analysis: congenital in that it was present in all human beings and acquired in that it has not been completely repressed.

The sexological construction of homosexuality as a hereditary pathology thus shifted toward a view that imagined homosexuality as some kind of failure in the acculturation of the child. In either interpretation, the patient's sexuality was considered deficient, an imperfect version of the adult heterosexual. According to Michel Foucault, the nineteenth (and early twentieth) century made men and women come to recognize themselves as "subjects of desire" and "subjects of a sexuality."

If before same-sex desire was discussed in terms of deviant sexual acts, customarily referred to as sodomy or pederasty, for which the cure was to live in abstinence or to repent, now same-sex desire was defined in terms of either a potentially curable (American psychoanalysis) or probably incurable (Freud) pathology.

Lesbianism

Lesbianism, in broad terms, is female homosexuality. Definitions of lesbianism, homosexuality, and other phenomena that were deemed as sexual perversions emerged throughout the nineteenth century. As new terminology was coined through the works of sexologists, the existence of the "lesbian" began to take shape toward the end of the century. However, it did so apart from the realities of what the true lesbian identity could have been, with definitions mostly based on medical and sexual studies formed in the context of the Victorian age. With so few sources left behind by women, and with the obvious secrecy involved in same-sex relationships, it is difficult to ascertain if a "lesbian identity" or "lesbian community" existed at all in this era. However, with the popularity of romantic friendships between women, the emergence of the "New Woman," and research work performed by sexologists, it is apparent that under the veil of the Victorian era, where sexual purity stood at the top of a high list of standards expected from women, Queen Victoria was wrong in saying that "ladies did no such thing."

Romantic friendships seem to have flourished in the nineteenth century, with many women, both single and married, maintaining very intimate relationships with one another. These relationships were fully accepted in nineteenth-century culture prior to marriage as an opportunity for young women to develop emotionally. It is a matter of debate whether many, if any, women in romantic friendships engaged in sexual relations with each other; however, accounts from personal diaries do affirm that some women did enjoy a great deal of freedom under the guise of this common practice. Proof can also be found in novels such as Margaret J. M. Sweat's (1823–1908) *Ethel's Love Life* (1859), which dealt with erotic relationships between women. Sweat is believed to have written the first lesbian novel in the United States.

Throughout the nineteenth century, the lives of some women began to change and improve. With more opportunities for higher education, social mobility, and economic independence, women were able to stretch the confines of the private sphere. Through these changes, the notion of the “new woman” emerged, typically a western woman from the middle and upper classes, who was able to enjoy economic freedom and avoid the pressures to marry and have children. With an escape from compulsory domesticity, it is thought that many new women found solace in relationships with other women, who may have better understood their new feminist ideals and growing political voices in involvement in the causes of abolitionism, the temperance movements, and other concerns of the time. The new woman and lesbians were therefore perceived by many as a threat to social order and as another vice created by industrialization and urbanization.

The family structure in the nineteenth century had the patriarch as the head of household and the main breadwinner. This construct often stood in the way of women setting up a home together. However, some women were able to expand these boundaries and were able to enjoy life in the company of their female partners. At both ends of the social spectrum, possibilities for cohabitation existed. First, there were women who were economically independent, who did not need to take a husband in order to ensure their livelihood. This freedom was often practiced by “new women” whose radical approaches to home life mirrored their feminist and egalitarian political views. Within this context, new women often committed themselves to “Boston marriages,” where two single women lived together in long-term relationships. This included the American founder of the settlement movement, Jane Addams, as well as the president of Bryn Mawr College, M. Carey Thomas.

However, for the most part, social and familial structures discouraged such arrangements. And, even though some privileged women were able to live together, they were still constrained by their family responsibilities and by the loss of respectability associated with breaking the norm and challenging woman’s place in society. The other group of women who, for at least some

period of time, were able to enjoy cohabitation were unmarried working-class women. The necessity to pool their funds in order to secure accommodation, allowed romantic partners a freedom that would have been unknown to most middle- and upper-class women. It is likely that in most cases, women who were involved in intimate friendships saw them end when marriage, children, and new family commitments ensued.

Definitions of lesbianism and homosexuality emerged through the research and conclusions of sexologists throughout the era. Sexologists thrived in an atmosphere in which people were being categorized according to their sexual orientation, which stigmatized people who were seen as deviant. Medical manuals written in the mid-nineteenth century tended to pronounce on the appropriate limits of female friendship. For example, sexologists like Richard von Krafft-Ebing, a professor of psychology, spent the last part of the century cataloguing and classifying sexual pathologies. In 1886, he published *Psychopathia Sexualis*, which included over 200 cases detailing sexual behavior. The German physician Karl Westphal wrote the history of a young lesbian and coined the phrase “contrary sexual feeling.” Havelock Ellis wrote the first English book to deal with homosexual behavior and to deal with the subject of lesbianism without treating it as a disease or a crime. His book *Sexual Inversion* (1896) had six case studies of lesbianism. He believed that feminism and all-female environments, such as all-female schools, could lead women toward same-sex relationships and noted the difference between “true inverters” and those for whom the “characteristic could be prevented.” He also associated lesbians with having masculine traits but a woman’s body and estimated that one in ten people were homosexuals. Some have argued that sexologists constructed lesbianism as a form of deviance in order to attack the feminist movement and women who challenged the patriarchal conventions of the late nineteenth century.

The work accomplished by sexologists did give an insight into lesbianism in the nineteenth century. For example, studies had been made of another kind of women who enjoyed same-sex female relationships, the prostitute. Many doctors and sexologists of the time drew parallels between prostitution and lesbianism, claiming

that one caused the other. This was accompanied by a rising fear that industrialization and urbanization were creating sexual perversions among other ills. In 1836, Alexandre-Jean-Baptiste Parent-Duchatelet published *De la Prostitution dans la Ville Paris* which gave evidence of same-sex relations between women in France. In his survey of Paris's regulated brothel district, Parent-Duchatelet discovered that as much as 25 percent of prostitutes had lesbian experiences. Duchatelet blamed this fact on the behavior of men who frequented brothels. Krafft-Ebing supported Duchatelet's findings in his *Psychopathia Sexualis*, writing that prostitutes sought comfort with the company of other women as a respite from sexual activity with perverted male clients. However, he also thought that lesbianism was situational and that women would resume heterosexual behavior in the proper conditions. Many assumptions were made about lesbianism, and even though it remained a legal act throughout the century, it was seen as a deviant act belonging to the underclasses.

Prostitution

In the nineteenth century, prostitution became a politically and morally charged issue as Western governments proposed methods to regulate

its practice. While prostitution obviously predated the nineteenth century, the numbers of women who worked in brothels or walked the city streets exchanging sex for money did dramatically increase during this period. Industrialization, urbanization, and the lack of well-paid employment opportunities for working-class women combined to drive many into prostitution. Although an occupational choice made out of desperate necessity, prostitution was regarded by politicians, doctors, and moralists as the great social evil that threatened both the physical and moral health of the nation.

Prostitution was not a topic suitable for public discussion. Relegated to the pages of fiction, the prostitute was considered to be a fallen woman seduced by an aristocratic rake and paid a heavy price for her moral weakness, usually with her own death. In reality, she was often a young laundress, seamstress, or domestic servant who relied on prostitution as a temporary solution to poverty, and neither she nor the working-class community in which she lived and worked regarded her actions as criminal. Commonly referred to by authorities as a "public woman," the prostitute challenged the middle-class ideology of separate spheres in which women were supposed to be sexually chaste and morally superior to men. Nevertheless, many politicians and doctors believed that the prostitute was a necessary evil who protected more respectable women from the sexual advances of men. Still, doctors and moralists blamed the prostitute (and not the men who paid for her services) for the rise in syphilis, called the new plague, in the nineteenth century and urged their governments to curb her activities.

The first attempt to regulate prostitution occurred in France under the direction of Napoleon Bonaparte, who attributed the rise of gonorrhea and syphilis that ravaged his Grand Army to prostitute camp followers. The Napoleonic Code of 1810 introduced a system of brothel licensing across Europe that continued for the next century and a half. Under this system, prostitutes were required to work in brothels and undergo regular examination for venereal disease. The police also had the authority to seek out and arrest clandestine prostitutes (those who refused to work in the brothels), and

► JOSEPHINE BUTLER

As the leader of the campaign to repeal the Contagious Diseases Acts in England, Josephine Butler (1828–1906) demonstrated how powerful women, who lacked the legal and political rights of men in the nineteenth century, could be. The daughter of an abolitionist father and an evangelical mother, she combined these two strands of political activism and Christian charity in her efforts to help prostitutes, whom she regarded as her fallen sisters. The accidental death of her six-year-old daughter in 1863 prompted Butler to perform rescue work in which she opened up houses of rest for physically ill prostitutes and even took some into her own home, attracting the gossip and criticism of her middle-class neighbors. As a feminist, she promoted higher education and employment opportunities for women, but she also believed that women's alleged moral superiority could be put to use to improve society. She saw the Contagious Diseases Acts as an insult to all women and an excuse for male vice and argued that if women had the right to vote, such laws would not be passed. Known for her delicate beauty and charismatic speaking skills, Butler shocked many of her middle-class contemporaries with her public speeches about prostitution, venereal disease, and the “instrumental rape” that doctors inflicted upon working-class women. She traveled all over England and published hundreds of speeches, enduring the heckling of men and even attempts on her life. However, she garnered the support of working-class men who resented the authority of the police in their communities and the terrorizing of working-class women. Many working-class women, however, were afraid to publicly speak out against the

Josephine Butler of Great Britain was an ardent feminist and Christian who worked tirelessly to improve the welfare of prostitutes around the world, whom she viewed as victims of male exploitation. (Library of Congress)

Contagious Diseases Acts, and the voice of the prostitute was often lost in the public debate over the system of regulation.

—Julie Taddeo

this led to raids on cafes and lodging houses and often the arrests of innocent women. Not surprisingly, regulation did little to curb rates of venereal disease because men were excused from medical inspection on the grounds that it would be too humiliating.

Across the Channel, the English government, at the urging of military and medical officials, also attempted to regulate prostitution to stop the spread of syphilis, which had infected 7 percent of the civilian population by midcentury.

Again, rather than encouraging men to undergo medical examination and abstain from extra-marital sex, the English government placed the blame for venereal disease solely on prostitutes. The Contagious Diseases Acts of 1864, 1866, and 1868 enabled authorities to arrest any woman who “looked like” a prostitute and force her to undergo a medical examination. If venereal disease was detected, she was then quarantined in a lock hospital (medical jail) in which she was not only treated for a disease that had no cure

at the time but was also remoralized with prayer and domestic training. Feminists regarded the Contagious Diseases Acts as highly discriminatory in that they reinforced a sexual double standard and excused male vice. Under the leadership of middle-class activist Josephine Butler, the repeal campaign against the acts succeeded in 1886. Unfortunately, by then many women who once relied on prostitution as a temporary measure had been marginalized and turned into outcasts within their own community. Another unintended result of regulation had been to turn prostitution from a female-controlled occupation into one dominated by male pimps. As in France, regulation in England also failed to limit the cases of venereal disease.

Abortion

Historically, abortion has been widely used as a method of limiting births, although the methods prescribed were not always effective. Perhaps the earliest recorded incident of an abortive technique is found in the royal archives of China about five thousand years ago.

Although the Anglo Saxons had probably regarded abortion solely as an ecclesiastical offense, Henry de Bracton (d. 1268) in his *Laws and Customs of England* carried over the provision of canon law on this topic into civil law, but condemned abortion only if the fetus had been formed and animated. When this occurred, however, was never defined by him. This continued to be the standard for English law until the nineteenth century. William Blackstone (1723–1780), whose commentaries had a great influence on American law, upheld the common law tradition of abortion only after quickening (when the fetus makes noticeable movements). Lawrence Lader held that after England's break with Rome under Henry VIII, English ecclesiastical courts seem to

have lost all interest in the question, leaving the subject to be a matter of common law.

In 1869, Pope Pius IX returned to the sanctions of Sixtus V and eliminated the distinction between a nonanimated and animated fetus. All abortions, according to Pius IX, should be regarded as murder. One of the reasons for the change was quite clearly an effort for consistency because the doctrine of Mary's Immaculate Conception promulgated by Pius IX in 1854 had stated that "from the very first moment of her conception" in her mother's womb she had been preserved from all stain of an original sin. This seemed to imply that Aristotle's old distinction of the changing nature of the soul was no longer valid. In fact, in a sense, the pope was reflecting new developments in biology. William Harvey had argued that all life came from the egg but this had been challenged by the discovery of spermatozoa in 1677. Although there had been a debate between the ovists and spermists over the importance of each, there had been a growing belief that fertilization took place when the sperm and egg met. Some by the middle of the nineteenth century were even arguing that the sperm penetrated the egg, although this was not documented until Oscar Hertwig observed it in sea urchins in 1875. Still, it seemed that life itself might begin with the earliest successful mixture of the male element with the female. Probably ultimately, however, it was not biology that decided which direction the pope would go but the necessity for consistency. If life for the Virgin Mary began at the moment of her conception, then all life must begin at the same time.

Moreover, the pope's rulings in a sense were reflecting a growing hostility to abortion. In 1803, the English parliament had replaced the common law about abortion with legislation that classed abortion (after quickening) as murder. Much of the impetus for the secular legislation against abortion was to preserve lives. American physicians, in their attempt to gain status over their rivals, such as midwives, also condemned the procedure, and their professional societies not only prohibited their members from engaging in abortion but had such prohibitions enacted into law. All of the states enacted laws prohibiting physicians from performing abortions.

Until the nineteenth century, folk remedies for abortion and superstitions about abortion essentially remained unchanged over the centuries. In the nineteenth century the selling of abortive products became a commercial business, although older more interventionist methods continued to be available. Technically, most of the remedies available did not mention the word abortion but went under such suggestive names as the "Female Regulator," "Uterine Regulator," "Woman's Friend," "The Samaritan's Gift for Females," and many others. Most of the remedies were described as having the imprimatur of science behind them. The label on Graves Pills for Amenorrhea stated, for example,

"These pills have been approved by the École de Médecin, fully sanctioned by the M.R.C.S. of London, Edinburgh, Dublin, as a never-failing remedy for producing the catamenial or monthly flow. Though perfectly harmless to the most delicate, yet ladies are earnestly requested not to mistake their condition [if pregnant] as MISCARRIAGE WOULD CERTAINLY ENSUE."

Many of the pills simply commercialized traditional remedies such as tansy, pennyroyal, aloes, hellebore, rue, ergot, and cotton root. The medicines were often effective. In fact, as late as 1939, the Federal Trade Commission forbade the sale and advertisement of a number of compounds designed to regulate menstruation on the grounds that the compounds posed serious health hazards. If advertised drugs and potions were not effective, there were instruments available to assist. *The American Medical Times* in 1863, under the title of "Instruments of a Notorious Abortionist," described forty simple instruments ranging from spoon handles bent in various shapes to pen holders with attached wires to actual forceps (Brodie, 1994, 226). There were also professional abortionists who were not yet forced underground.

Increasingly, however, there were legal restrictions put on abortion. For much of United States history, abortion had been treated according to the common-law tradition in which abortions before quickening were not punishable. Those procured later in pregnancy might be high misdemeanors if the woman died, but not felonies. As criminal code revisions began in the various states, replacing the common law,

abortion was often singled out for attention. The laws varied. In Connecticut, Missouri, and Illinois, abortion restrictions came in the form of tighter laws against the use of poisons. The first state to make an abortion a crime was New York, which in 1829 prohibited anyone, including a physician, from attempting abortion at any period of pregnancy except to save a woman's life. The state then proceeded to legalize abortions done by physicians when the mother's life was at stake, delegating to the medical profession the control of abortion. Most states followed this same delegation of authority.

Inevitably abortion began to go underground. Many of those providing such abortions were women. Perhaps the best illustration of the prevalence of women abortionists is the case of Elizabeth Blackwell, who is generally recognized as the first woman in the United States to graduate from a medical school. When she tried to establish her practice in New York City in the 1850s, she was denied rental at the first few boarding houses she approached because the landlords mistook her for an abortionist.

Probably the best-documented abortionist was Madame Restell, actually Ann Trow Lohaman (1812-1877), who ran a mail order business and abortion service in New York City from the 1840s through the 1870s. Because technically, as indicated above, abortion by nonphysicians was illegal in New York state, Restell was often arrested, although only once was she sentenced to a term in prison. Mostly she was tolerated by the law enforcement officials, and she grew famous and wealthy, leaving an estate of more than a half-million dollars when she died. She was not alone, and abortionists who were arrested were often not found guilty, particularly if abortion took place before quickening.

The Scientific Study of Sexual Relations in Europe

The discipline of sexology, though not the term itself, dates from the second half of the nineteenth century. The word “sexology,” a Latin-Greek hybrid describing the study of sex, originated from the German *Sexualwissenschaft*, which was first used in 1907 by the dermatologist and sex researcher Iwan Bloch (1872–1922). Sexology differs from erotology insofar as it focuses upon the theoretical rather than the practical aspects of sexuality. The advent of sexology in Britain and continental Europe was made possible by a number of related factors, including the French physician B. A. Morel’s influential concept of physiological and psychological “degeneration,” the medical profession’s growing interest in homosexuality, and the public’s concern over the proper relationship between men and women. During its early phases in the Victorian period, sexology was generally viewed as a somewhat radical and morally questionable field of study.

Among the first sexologists was the gay German lawyer Karl-Heinrich Ulrichs, who coined the term “Uranism” (for homosexuality) in a series of twelve pamphlets (1864–1879). His neologism derives from the Greek word Uranus (Heaven) and refers to a distinction Plato draws in his *Symposium* between earthly (Pandemian) love and heavenly (Uranian) love—the former existing between men and women, the latter between men. Blending ancient mythology with contemporary biology, Ulrichs explains how human beings are divided before birth into three categories: male, female, and “urnings” (male homosexuals) or “uringin” (lesbians). In Ulrich’s opinion, male and female homosexuals are those with the biology of one sex and the sexual instinct of the other; thus, he describes an urning as a “female soul in a male body.” Because Uranism is inborn, natural, and healthy, he contended, laws against it ought to be repealed. His views were shared by the Austrian-Hungarian writer Karoly Maria Kertbeny, who in 1869 first used the term “homosexual” in an anonymous pamphlet addressed to the Prussian Minister of Justice.

Perhaps the best-known practitioner of sexology was the Austrian psychiatrist Richard von Krafft-Ebing. Krafft-Ebing at once maintained

the accepted wisdom of his period and sought to advance it through evolutionist theory. He believed, as did most of his contemporaries, that masturbation was dangerous, and that it was implicated in mental illness and sexual pathology. Yet he also subscribed to the more progressive notion that defects in the nervous system were responsible for disease, and he claimed that while some “perversions” were innate and others acquired, even those of the latter type could not manifest themselves in individuals whose nerves were sound. His opinion on the primary function of sex—to reproduce—logically led to his judgment that any sexual practices not conducive to reproduction were unnatural.

Krafft-Ebing’s case studies of unconventional sexuality were collected in his *Psychopathia Sexualis* (1886), in which he analyzes homosexuality, fetishism, sadism, and masochism. To categorize these variations, he either uses the terms devised by others or develops his own. He borrows “homosexuality” from Kertbeny and “fetishism” from the French psychologist Alfred Binet, while deriving “sadism” from the Marquis de Sade (who took pleasure in giving pain), and “masochism” from Leopold von Sacher-Masoch (who enjoyed receiving it). Krafft-Ebing also discusses satyriasis, nymphomania, necrophilia, incest, and pedophilia, mostly from a legal point of view.

Krafft-Ebing hoped that *Psychopathia Sexualis* would assist other physicians in treating the sexual difficulties of their patients and enable the courts to cope more thoughtfully with diverse sexual practices. Because his book was read not only by professionals but also by the general public, however, its most significant effect may well have been to help make alternative sexuality a topic of widespread discourse and debate. *Psychopathia Sexualis* also influenced the forensic psychiatry practiced in continental Europe during the early twentieth century.

Another significant late-Victorian sexual text is *The Evolution of Sex* (1889) by Patrick Geddes and J. Arthur Thomson. Unlike *Psychopathia Sexualis*, *The Evolution of Sex* focuses on mainstream sexuality and is especially concerned with “the divergent evolution of the sexes” as expressed in “the preponderating passivity of the females, and the predominant activity of the males.” Geddes and Thomson

argue that men's often-destructive "katabolic" nature expends energy, while women's nurturing "anabolic" temperament conserves it. They also claim that "[m]an thinks more, woman feels more." These sex-based dichotomies apply to even the lowest forms of life and are immutable; hence, "What was decided among the prehistoric Protozoa cannot be annulled by Act of Parliament." Because the sexes are "complementary and mutually dependent," men and women ought to cooperate more fully; furthermore, women ought to play a larger role in public life if the human species is to progress toward higher levels of civilization.

In *Love's Coming of Age* (1896), Edward Carpenter draws upon the work of Geddes and Thomson. While he accepts the differences between the sexes as biologically determined, he believes that men and women should not be "two groups hopelessly isolated in habit and feeling from each other." Moreover, he claims that male dominance jeopardizes civilization, and that female influence is a necessary counterbalance. Carpenter is more original when arguing for sex as a means of unifying two people rather than simply reproducing the species. Himself a gay man and the author of the pamphlet "Homogenic Love and Its Place in a Free Society" (1894), Carpenter also discusses homosexuality in a section entitled "The Intermediate Sex." Here, he argues that those of the "Uranian type" are often fit and healthy, and that they might well "have an important part to play in the evolution of the race."

Carpenter's progressive attitude toward sexual diversity is shared by Havelock Ellis in his seven-volume *Studies in the Psychology of Sex* (1896–1928). In the first volume, Ellis contends that sex is "the central problem of life," describes the deleterious effects of silence on this crucial

topic, and promises to present his research and conclusions "in that cold and dry light through which alone the goal of knowledge may truly be seen." Using medical, anthropological, biological, literary, and autobiographical sources, Ellis investigates the wide range of sexual practices with grace, conscientiousness, and objectivity. His books are remarkable for both their sober tone and their willingness to challenge commonplace assumptions about topics such as masturbation.

Developing from the work of Ellis and other pioneers, sexology flourished during the first decades of the twentieth century. Most activity in the field occurred in Berlin, where the *Zeitschrift für Sexualwissenschaft* (Journal of Sexology) was published in 1908; the Society for Sexology took shape in 1913; the Institute for Sexology was created in 1919; and the International Meeting for Sexual Reform on a Sexological Basis was convened in 1921.

■ Introduction: Education and Literacy

The spread of literacy and educational institutions during the eighteenth and nineteenth centuries accompanied the growth of industrialization, colonization, and the devel-

oping ideology of modernization. The scientific revolution that underpinned industrialization and its creation of new material comforts encouraged a thirst for new knowledge that was matched

with new printing techniques and the mass production and distribution of books and periodicals. Education and literacy became adjuncts to the zeal for modernization, progress, and the growing taste for leisure entertainments. Institutions that encouraged universal literacy also meshed with the rhetoric of the Enlightenment and the goal of ideal citizenship, although widespread literacy in industrialized nations did not become a reality until the mid- to late nineteenth century.

The amorphous ideology of progress also propelled European colonization with its “civilizing” mission. Interested foremost in profit and stability, European rulers warily cultivated a common culture and language in colonial realms and sought to forge a social environment amenable to commerce. Colonization also opened these realms to zealous Christian missionaries, who cultivated religious and secular instruction in educational institutions. In a somewhat contrary pattern in eastern Asia, elites in both Japan and China tried to evade colonization by developing a modern industrial and social order that included public education and was capable of matching Western powers. This effort met with more success in Japan, in part because its much smaller population more easily accommodated a top-down model for massive social change.

How traditional institutions, languages, and learning should be approached in the colonial world did not always fit a monolithic template of an “imposed” culture. The British East India Company in its early decades discouraged missionary work in India, as the company’s profit-driven directors recognized that the effort to convert the indigenous populace to Christianity could create tension and provoke unrest. While the British model of empire favored the cultivation of native elites and indirect rule, educational policy for decades vacillated between the “Orientalists” who sought to respect indigenous scholarship and allow existing educational institutions to flourish and those English missionaries and utilitarian reformers who took for granted the superiority of a curriculum based on the study of the English language and Western science, literature, and history. This debate essentially ended in the 1830s when colonial authorities accepted the recommendations of Thomas Macaulay, who in his famous “Minute

on Education” of 1835 proposed that Indian schools should have the goal of producing a native elite “English in taste, in opinions, in morals, and in intellect.” In China, which already had a well-educated elite, missionaries first catered to young women and the poorer classes, whose education was limited in the traditional order. These and other schools ultimately began to rival the traditional Confucian model in creating well-trained graduates fit for bureaucratic positions. In Africa, the missionary schools in British realms and secular schools established by the French helped forge local elites who ultimately would lead anticolonial movements, as was also the case in China and Southeast Asia.

—Fred Nadis

British Educational Policies in India

Parts of India came under British rule as early as 1757, but educational policies did not receive much attention from colonial administrators until the end of the eighteenth century. During the early decades of the nineteenth century there was a heated debate among scholars, officials, and missionaries about the form and content of the education to be provided to Indian nationals. Policies eventually developed a top-down filtration model of education, with higher education receiving greater attention than primary education and with a greater emphasis on “modern” English education than either traditional Sanskrit/Persian education or modernized vernacular education. Ultimately, British educational policies in India lent at least nominal support to all three systems and were the combined product of particular, and often opposing, ideological standpoints.

Early British administrators engaged with education in an attempt to continue preexisting custom. In Bengal, the first Indian region to come under British rule, local rulers had an established tradition of supporting educational projects. Warren Hastings, British India’s first governor-general (1773–1785), accommodated policy to Indian conditions and supported the Persian and Sanskrit scholarship then prevalent among literate classes. This approach ensured that British rule would not noticeably upset

➤ MACAULAY'S MINUTE ON INDIAN EDUCATION

Macaulay's 1835 Minute is perhaps the best-known document on Indian education today. It was written at the height of the Orientalist-Anglicist debate, wherein the former argued that it was the administration's duty to support and encourage traditional learning, and the latter upheld that only English education had any value. This document is remembered for both its energetic rhetoric as well as the level of its prejudice, which enabled the writer to declare that "a single shelf of a good European library was worth the whole native literature of India," despite his having "no knowledge of either Sanskrit or Arabic."

This document is seen as representative of the contemptuous attitude of the colonizer toward a subject civilization and has therefore become iconic of colonialism. It has garnered more credit as a turning point in British educational policy than historical records justify, in part because of the

quality of its rhetoric and in part because of its influence on Lord Bentinck. "Macaulay's children" is today a common idiomatic—and often pejorative—phrase referring to Indians who value European modes of knowledge and being over their own culture: "Indians in blood and colour, but English in tastes, in opinions, in morals and in intellect."

local expectations, thus minimizing possible resistance to the foreign power. Subsequent administrators continued to uphold this policy of reconciliation, leading to the establishment of the College of Fort William in 1800 so that newly arrived British officials could be trained in Indian literature and culture.

Proponents of the evangelical and utilitarian movements, however, challenged the Orientalist policy of reconciliation in the nineteenth century. Evangelists such as Charles Grant (1746–1823) believed that by choosing to uphold Indian institutions and traditions, the British administrators were making themselves passive spectators of un-Christian depravity. They argued that the proper education was the sole means to rationality as exemplified by Christianity and Western learning and that the dissemination of the English language was the first essential step toward exposing the errors of the native way of life. Language and education thus became critical weapons for achieving the larger goal of cultural transformation.

These opposing points of view about educational models generated much friction and led to a legislative compromise in 1813. The East India Company made its first major financial

commitment to education because of the Charter Act of 1813. The act set aside 100,000 rupees so that Indian literature and native scholarship could be encouraged even as Western sciences were introduced in British Indian territories. Thus, the British administration in India made public education (at least nominally) its responsibility 20 years earlier than in England because of a combination of local tradition, political expediency, and ideological motivations. Until the 1830s, however, the directives of the 1813 Charter Act were only partially carried out. The annual financial grant continued to primarily fund Sanskrit, Arabic, and Persian learning, despite demands for a focus on modern science education.

In 1835 Lord William Bentinck ordered that English education, including mainly language, literature, and science, should receive the maximum funds: this order significantly shifted the terms of the debate. English replaced Persian as the language of government records, a change that marked English as the language of political dominance and mobility. The avowed project of modernization and advancement through English education clearly set the project at odds with the case for holding on to ancient tradition as

represented by Sanskrit and Persian. Subsequent policy placed explicit religious matters outside the purview of the administration, though “neutral” moral values were to be all-pervasive.

The official line citing modernization and advancement generated a discussion of the relative merits of English and the local vernacular languages as the medium of instruction. Lord Auckland in 1839 restored some of the pre-1835 support for native scholarship but maintained the focus on English education. He also upheld the filtration theory, which supported higher education and teacher training instead of investment in primary education. Neither Bentinck’s nor Auckland’s resolutions took a stand to promote the vernacular languages and education, which increasingly were propounded as the means to diffuse European ideas among a wide audience. Indians also took up the cause of the development of the vernacular languages, driven partly by a sincere desire to educate the masses, partly by a sense of cultural loyalty, and partly by disillusionment with the failed promise of English.

These divergent points of view shaped Sir Charles Wood’s educational dispatch of 1854, which was the cornerstone of educational policy for the rest of the century. This document came close to achieving a compromise among all the dissenting factions: it retained as its primary objective the dissemination of Western learning but also reaffirmed a commitment to the study of Indian classics. It rejected the filtration theory in favor of supporting primary education and instituted grants for private ventures; both aspects encouraged vernacular education.

In 1904, however, regulatory policies were put in place to curb the growth of schools and colleges. Lord Curzon, then governor-general of India, was alarmed that Western ideas of governance and democracy could recoil upon the rulers and mandated a minimum fee for financial aid and government recognition, thus increasing the cost of education. The number of scholarships that institutions could offer was also reduced. Once again, education became a means to check the Indian potential to threaten British ascendancy.

Missionary Schools in Colonial Africa

Christian missionaries initially came to Africa in the late eighteenth century as part of the abolitionist movement and were the first to introduce Africans to Western education. The major influx of missionaries to Africa began after the slave trade was abolished by Britain and the United States in 1807. One of the most famous, David Livingstone, was a Scottish member of the Universities’ Mission to Central Africa (UMCA), who traveled through eastern, central, and southern Africa between 1840 and 1873. The three C’s—Christianity, Commerce, and Civilization—that he advocated for Africa summarize missionary efforts to spread the word of God, replace the slave trade with legitimate commerce, and rid Africa of its savage customs. This civilizing mission thus rested on both proselytism and education.

Missionaries, like other Europeans, remained limited to the coasts of western and southern Africa until the mid-nineteenth century, when missionary-explorers such as Livingstone began work in the interior. While the first Anglican missionary arrived in the Gold Coast in 1751, Catholic missionaries did not come to stay in Senegal until after 1800. The 1787 settlement at Freetown in Sierra Leone, established for London’s black poor and later African freed slaves, welcomed the Church Missionary Society (CMS)

in 1804. The CMS established the Fourah Bay College in 1827, which in 1864 educated Samuel Ajayi Crowther, bishop of the Niger. In South Africa, where the Dutch Reformed Church provided missionary education for whites, extensive missionary activity among Africans came in the early nineteenth century.

The first missionaries to stay in East Africa were the CMS missionaries Johan Ludwig Krapf and Johannes Rebmann, who arrived in the 1840s. Although they had little success along the predominantly Muslim coast, they established a viable CMS station and school for a community of freed slaves at Freretown near Mombasa, Kenya, in 1875. Other missionaries who settled in the African interior during the nineteenth century include the French White Fathers, the London Missionary Society, the UMCA, the Moravians, and various groups of Catholics, Anglicans, Baptists, Presbyterians, Lutherans, Methodists, and other denominations.

The earliest converts were often freed slaves, the poor, and members of other disadvantaged groups. Most Africans saw mission schools as a means toward higher-paying jobs in the new cash economy, which resulted in increased freedom from the control of elders and chiefs. Missionary education thus created a Western-educated African elite further out of the reach of chiefs and elders by the 1840s in western and southern Africa and elsewhere by the first decade of the twentieth century. Not all chiefs disapproved of the missionaries. Moshoeshe, leader of the southern African kingdom of Lesotho, befriended European missionaries in the mid-nineteenth century primarily to gain access to horses and guns. He discontinued indigenous initiation schools and employed mission school graduates as scribes as a way to encourage his people to attend mission schools.

Mission schools generally ran on a strict schedule or time table. The curriculum included reading and writing, arithmetic, Bible study, drill or physical education, and handwork. Instruction often began in the vernacular and switched to a European language at the higher levels. Literacy, especially the ability to read the Bible, was central to missionary education. Colonial governments of the early twentieth century

A group of students and staff at a Presbyterian mission school in Liberia, about 1895. (Library of Congress)

criticized missionaries for focusing too much on literary instruction, but not all missions were academically oriented. The Basel mission in Ghana, for example, implemented an educational program centered less on academics than on practical instruction, or learning by doing, in 1843. Even in other missions, students were often expected to work for the mission under the pretext of vocational training. Boys learned carpentry while building furniture for schools and homes and learned agriculture while working the school farms. Girls were taught cooking and cleaning by doing the domestic chores of the mission.

The administrations of most British colonies in Africa relied heavily on missions to carry out educational work, whereas the French were quick to establish a secular education program. British governments subsidized mission schools by providing grants and paying teachers' salaries throughout the colonial period. Meanwhile, in Senegal, for example, the first French government school opened in 1818, and by 1903 the French passed the first of a series of laws designed to limit the influence of missionary education. In both cases, the influx of Christian missionaries sparked colonial interest in Africa, and mission schools produced an influential

THE BOMBAY AFRICANS

The Bombay Africans were former slaves whom members of the Anglican Church Missionary Society (CMS) rescued from Arab dhows in the Indian Ocean and brought to the Sharanpur Christian Village near Bombay (present-day Mumbai), India. One hundred fifty Bombay Africans returned to East Africa when W. S. Price from the Indian mission came in 1875 to establish a mission station and school at Freretown, just opposite the island of Mombasa in present-day Kenya. This new CMS settlement was named after Sir Bartle Frere, who negotiated the Treaty of Abolition with the sultan of Zanzibar in 1873. Many of the well-educated Bombay Africans became teachers at the Freretown School upon arrival. By the late 1880s the schools at Freretown and the nearby CMS station at Rabai had a combined total of more than 350 students. There were separate boys' and girls' schools, and the mission offered training for teachers and catechists. When the Imperial British East African Company arrived in 1888, company officials offered educated Africans clerical jobs with much higher salaries than the mission could afford. As a result, Freretown lost all but one of its African teachers by 1890. In the 1890s African residents at Freretown became increasingly dissatisfied with the low level of education offered at their schools in comparison to the new CMS Buxton High School, which catered to Indian, Arab, and African Muslims living on the island of Mombasa. Just like Freetown in Sierra Leone, the Freretown settlement symbolized missionary efforts to create a model Christian community educated in Western values and free from slavery.

—Corrie Decker

class of Western-educated elites across the continent. Many of the first presidents of independent African countries, such as Kwame Nkrumah, who became president of Ghana in 1957, were products of mission schools.

Missionary Schools in China

From the time they arrived in China, missionaries began establishing schools to support their evangelical work. China had a well-established educational system. However, it was designed mainly to prepare young men for success on the Chinese government's civil service examinations and focused almost exclusively on the Confucian classics. Missionaries saw education as an opportunity to extend their efforts to spread Christianity especially among the female population and the lower classes, who made up a majority of the converts.

The use of schools for mission work began with the Catholic religious orders that arrived in the sixteenth and seventeenth centuries. The goal of these early schools was to educate their converts, develop educated leaders for the Church, and create a Chinese priesthood. The establishment of schools by Protestant missionaries goes back to Robert Morrison of the London Missionary Society, who arrived in China in 1807. In 1818 he founded the Anglo-Chinese College in Malacca with William Milne. While the college was mainly meant as a training institution for Western and Asian missionaries, it was the first Protestant educational institution connected to the China missions. After the First Opium War (1839–1842), the school was transferred to Hong Kong. Elijah and Eliza Bridgman, of the American Board of Commissioners for Foreign Missions, opened the first mission school for girls in Shanghai in 1850. After returning from furlough in 1864 Eliza moved to Beijing, where she founded another school for girls, the Bridgman Academy.

Even though efforts to establish schools before 1860 were relatively successful in integrating education into the movement, missionaries remained confined to treaty port cities, where they established schools in connection with their work. The end of the Second Opium War in 1860 opened China's interior to Western penetration, allowing mission societies to extend

▶ SAMPLE COURSE OF STUDY FROM A CHINESE GIRLS SCHOOL IN CHEFOO, SHANDONG

The list of courses below provides an example of what Chinese female students in nineteenth-century American Presbyterian (North) mission schools were studying. The curriculum varied depending on the school and mission, but it shows that the schools provided a well-rounded education and were not just religious institutions.

Course of Study

First Year

Three Character Classic
Mandarin Catechisms
Gospel of Matthew, from 1st to 8th chapters

Hundred Family Names
Commit to Memory 500 Characters

Second Year

Read the Analects (Confucius)
Explain the Analects (1st Part)
Explain Three Character Classic

Commit to Memory 500 Characters
Parables of Our Lord
Mental Arithmetic (1st Part)

Third Year

Great Learning (Confucius)
Doctrine of the Mean
Mencius (1st Part)
Explain Analects (2nd Part)
Catechism on 10 Commandments (1st Part)

Mental Arithmetic (2nd Part)
Geography (1st Part)
Book on the Soul
Arithmetic (1st Vol.)

Fourth Year

Mencius (2nd Part)
Book of Poetry (1st and 2nd Parts)
Explain Great Learning
Explain Doctrine of the Mean
Catechism on 10 Commandments (2nd Part)

Mandarin Essays
Vocal Music
Arithmetic (2nd Vol.)
Geography (2nd Part)
Evidences of Christianity (1st Book)

Fifth Year

Book of Poetry (3rd and 4th Parts)
Arithmetic (3rd Vol.)
Evidences of Christianity (2nd Book)
Essays in Mandarin
Book Keeping

Explain Mencius
Review Geography
Acts of the Apostles
Old Testament History
Physiology

Sixth Year

Book of History (1st and 2nd Parts)
Explain Book of Poetry (1st and 2nd Parts)
Composition
Epistle to the Romans
Primer of Physical Geography

Book of Essays (1st Part)
Review Analects
Elements of Natural Science
Extracts from Chinese History
Elements of Geology

Seventh Year

Book of History (3rd and 4th Parts)
Composition
Explain Book of Poetry (3rd and 4th Parts)

Extracts from English History
Book of Proverbs (Old Testament)

their reach into new areas. As new missionary stations were opened, missionaries established many primary and secondary schools. Protestant schools were organized to provide their new converts with an education and to spread Christianity to non-Christians. Primary schools for boys and girls could be found throughout a station's assigned area and were founded by traveling missionaries or local Christians under missionary guidance.

Other schools focusing on older students were founded in the central stations where the missionaries resided. The high schools for older students were founded by those who found preaching unfulfilling and by wives who remained at the station while their husbands were preaching in the field. By the time of the 1890 conference of Protestant missionaries, held in Shanghai and attended by most Protestant groups regardless of denomination or nationality, the various societies reported a total of 16,836 pupils in mission schools. The Catholic Church was equally successful, with 558 schools containing 8,013 male and female pupils reported throughout the Kiangnan (Jiangnan) mission in 1879. In 1898 the number of pupils increased to 16,571.

The curriculum adopted by the Protestant missions taught secular as well as religious subjects. They were some of the first institutions to include Western subjects such as physiology and arithmetic, which were intended to open the eyes of students to a new type of learning and provide them with knowledge they could use to transform Chinese society. The courses on Chinese subjects were offered to attract students to the school. While the subjects taught tended to be consistent throughout China, language of instruction varied considerably. Some institutions conducted classes in English, and others insisted on Chinese. Through their schools the Protestants provided education to the lower classes and women who did not always have ready access to schools.

The Catholic schools also incorporated religious and secular subjects into their curriculum. Unlike the Protestant schools, however, Catholic schools generally excluded non-Christian students. Their schools were intended to strengthen the Church, not to convert new sections of the

population. While they did incorporate Western and Chinese teaching materials, they avoided any writings that might encourage superstition or non-Christian ideas. Like the Protestant schools, Catholic schools did teach certain Chinese materials to ensure that their graduates would be seen as educated by society.

During the nineteenth century the Protestant mission societies made the first attempts to develop uniform policies for the schools. Toward this end, missionaries formed the School and Textbook Series Committee in 1877. In 1890 a further step was taken with the formation of the Educational Association of China. These organizations also provided opportunities for sharing ideas on education.

By the early twentieth century, Protestant mission schools had developed into more professional enterprises with permanent principals and staff. New staff was appointed by the mission boards specifically to teach and administer the schools. The schools were no longer staffed by part-time workers or missionaries whose primary responsibility was preaching and pastoral work. With the new emphasis on education, the school systems expanded. By 1917 Protestant organizations reported 191,033 students. One of the major problems that all mission schools encountered after 1900 was funding. In general the U.S.- and European-based mission societies provided all of the funds to build and run the schools. However, as school systems began to expand, the home churches could not keep pace. Therefore, mission societies began to insist on tuition for students who could afford to pay for their education.

While still expanding their school systems, Protestant mission societies also cooperated in the establishment of union colleges in response to demand for higher education. Given the expenses involved, the few institutions of higher learning founded in the nineteenth century, such as the Dengzhou College under Calvin Mateer in Shandong, were small and provided a general education rather than training in a specific subject such as science or history. In the twentieth century these early institutions developed into universities that included instruction in the liberal arts, medicine, and theology. Many postsecondary training schools, particularly denominational

training schools for ministers or teachers, also developed during the 1910s. Some of the newly organized universities included Shandong Christian University (Qilu/Cheeloo) (1904), the University of Nanking (1910), and Ginling College (1913). Ginling College was founded as a women's college in Nanjing.

The Catholic Church also expanded the number of its schools between 1900 and 1914. While the schools remained focused on educating existing converts and training Church leaders, they also began admitting small numbers of non-Christian Chinese. However, they remained far behind the Protestants in size and the scope of their school system, and their focus remained on primary schools and charitable work rather than on institutions of higher education.

The missionary schools established in the nineteenth and early twentieth centuries produced scores of graduates who became, among other things, teachers and administrators in local government institutions. Because of their advanced training, some mission graduates went on to achieve political prominence. Mission schools also opened up educational and professional opportunities for new sections of the population. Notable in this regard were the many young women who studied in mission schools and became teachers, doctors, or nurses.

Missionary Schools in Oceania

Christian missionaries were often the first resident agents of European colonialism in indigenous communities throughout the world. In Oceania missionary activity was generally entangled with religious belief and nationalism, with the Roman Catholic missions supported by the French and Protestant missions supported by the British and Americans; there was also conflict within these two major factions. One important aspect of missionary activity was education of both recently converted adults and their children. Education included reading, writing, basic arithmetic, and the study of scripture, but it could also include other subjects such as lessons on morality, European history, dance, and manners. In the latter case, mission education that stressed modes of domestic life based on European notions of propriety over indigenous ways of living served to legitimize European claims to superiority. Many missionaries in Oceania were simultaneously fascinated and repulsed by indigenous traditions. The goal of the missionaries, as colonial agents, was to educate indigenous peoples about Western ways of living and to discourage the continuation of indigenous practices, often driven by a sincere desire couched in Christian belief to save “innocent” souls who had not been baptized. Ironically, many missionaries held the belief that Oceanic peoples, like indigenous people throughout the world, were in danger of disappearing or that this process was inevitable.

Archaeologist Angela Middleton, whose work focuses on New Zealand, divides missions in Oceania into two categories: missions as institutions in Australia and missions as households in the Pacific islands, including New Zealand. In Australia missions were large institutions, often seen as equivalent to prisons, not least by the Aboriginal people who were sent to such places. In these missions, children were sometimes forcibly removed from their families to be educated in Western ways either before or after entering

► MISSION SCHOOLS AS PRESERVERS OF OCEANIC CULTURE HISTORY

Mission schools often had the implicit or explicit goal of wiping out the indigenous practices of Oceanic people by discouraging ways of life and modes of thought that were seen as uncivilized or heathen. At the same time, missionaries were fascinated by the rituals and traditions they were trying to suppress. Besides explorers' accounts, some of the most detailed eighteenth- and nineteenth-century accounts of traditional Oceanic cultures come from missionaries. As a result, missionaries and their students became some of the best-known sources for understanding traditional Oceanic cultures. For example, some of the classic records of traditional Hawaiian culture were originally written down by Samuel Kamakau and David Malo, native Hawaiians originally educated in mission schools. Te Rangi Hiroa found some of the best primary sources on traditional Mangarevan ethnography in the work of Père Laval and his student Mama Taira Putairi. As mission schools encouraged widespread literacy, they also encouraged the writing down of Oceanic traditions, oral histories, genealogies, traditional chants, and systems of knowledge. These sources are preserved today, providing valuable records for scholars interested in understanding what Oceanic cultures were like prior to and immediately after initial European contact as well as the perceptions of the early missionaries. It is a testament to the resilience and adaptability of Oceanic cultures that many traditions were preserved, in some cases using the educational institutions of the missions meant to wipe out those traditions.

—James L. Flexner

the institution. This practice of removing children to mission sites for reeducation forms part of the legacy of the “Stolen Generations” of Aboriginal children in Australian history, analogous to the legacy of Bureau of Indian Affairs schools in North America, which famously sought to “Kill the Indian, and Save the Man.”

In contrast, many mission stations elsewhere in Oceania, such as New Zealand and Hawaii, were operated as households. The missionaries in these settings often lived in close contact with the local population, incorporating local

children into the household and sometimes relying heavily on indigenous people for their subsistence while at other times becoming entwined in local political struggles. In the mission station at Te Puna, New Zealand, missionary John King and his family often included Maori children in their household, including children of chiefly descent. Household missions exemplified the civilized mode of domestic life, and the incorporation of indigenous children was critical to the acculturation process.

In Hawaii the educational programs of the American Board of Commissioners for Foreign Missions, including school-building activities, were immediately recognized and encouraged by Hawaiian royalty as politically valuable, notably by Queen Ka'ahumanu. Some Hawaiian elites even sent their children abroad to be educated. One result of the support of missionary activity by Hawaiian royalty was a high literacy rate among Hawaiian commoners and elites alike in the nineteenth century; where foreign missionaries were not available, local native Hawaiians filled in. In the leprosy settlement at Kalaupapa, Moloka'i, Hawaii, during the 1880s and 1890s, separate schools were set up by Catholic missionaries as part of the boys' and girls' orphanages in the community. In this case, Hawaiian children sent to Molokai after their diagnosis with leprosy, often without parents or family members, were part of a nested institution, an orphanage and school within a leprosarium run by the independent Kingdom of Hawaii, part of the project of a larger institution, the Roman Catholic mission to Hawaii, supported by the French government. Far from being carried out for purely charitable purposes, though such a motivation was surely there in some cases, mission education took place in a wider context of global colonial politics.

Education in Meiji Japan

The Meiji government, which came to power in 1868, launched a series of educational reforms in order to speed up the country's modernization and strengthen national solidarity. For the first time in Japanese history, a national schooling system at the elementary level for the entire population was introduced. In order to develop professionals in Western science and technology as well as educate the elite class for state administration, a centralized system of higher education was also established. By the end of the Meiji period, the teaching of Confucianism and Shintoism had become an important component in fostering both patriotism and loyalty toward the emperor as sacred and inviolable.

Meiji Japan inherited a literate population from the Tokugawa period. Prior to the Meiji Restoration, the male literacy rate was estimated at 40 percent, while the female literacy rate was 17 percent, primarily because commoners and samurai received a Confucian education at writing schools (*terakoya*) or even acquired advanced training at private schools (*shijuku*) in Western science, geography, military science, and medicine. In 1872 the Fundamental Code of Education (Gakusei) provided an outline for replacing these traditional schools with a French-style national school system. In this first comprehensive plan for the entire population, 8 universities, 256 middle schools, and 53,760 elementary schools were to be established. Four years of compulsory education was aimed at achieving a higher rate of literacy throughout the population. However, the shortage of central funding prevented a smooth start. The percentage of girls who attended elementary schools was much lower than that of boys. No university was established. The government's emphasis on its Europeanization policy also caused dissatisfaction among local ex-samurai because of the central planning policy.

Conservatives who opposed Western methods of education demanded the revival of Confucianism and Shintoism. From 1885 to 1889,

> GAKUMON NO SUSUME

The popular enthusiasm for education in early Meiji Japan was fostered by Fukuzawa Yukichi's seventeen volumes of *Gakumon no Susume* (An Encouragement of Learning), published from 1872 to 1876. This work emphasized the importance of education for the entire population regardless of class and gender and encouraged practical learning rather than traditional forms such as Confucianism and Hu Shih's studies. It was one of the most influential works of enlightenment thinkers in the Meiji period, selling 3.4 million copies until Fukuzawa's death in 1901. The Meiji government banned the first section in 1881 because a remark on the equality of all men (drawn from the U.S. Declaration of Independence) could become a psychological backbone for the People's Right Movement.

—Ryoko Nakano

Mori Arinori, the new minister of education, initiated a project of establishing a Prussian-style nationalist education system in order to create loyal and hard-working subjects. As epitomized in the Imperial Rescript on Education (Kyoiku Chokugo) of 1890, moral teaching (*shushin*) as the central value for elementary education emphasized traditional Confucian and Shinto values such as benevolence, justice, filial piety, and reverence for the imperial house. Japanese writings and Japanese translations replaced books written in Western languages. In 1904 the Ministry of Education introduced compulsory textbooks for elementary education.

To foster the advancement of specialized knowledge in the sciences, the ministry prepared a path of higher education for first-class students. The Decree on the Imperial University (1886) granted the term "Imperial" to five state-financed universities (four more universities were added by the 1918 University Order) and ranked them above private schools (renamed "universities" after 1918) that had already carried out substantial programs of higher education. As a result, Tokyo Imperial University became central to the recruitment of civil service bureaucrats and the education of specialists in advanced sciences and technology.

By the end of the Meiji period in 1912, the Japanese education system had made a remarkable transformation. Although female education lagged behind male education in terms of secondary education, almost the entire population, including girls, had entered elementary schools. Owing to the state-centered education system that provided a moral and nationalistic doctrine for people's daily lives, the Meiji government achieved a state-controlled system of education, laid the foundation for national solidarity and loyalty toward the emperor, and stimulated the further growth of technical and vocational training for industrial development in Japan.

Education in Colonial Southeast Asia

Prior to the introduction of Western education in the latter half of the nineteenth century, Southeast Asian societies had a long tradition of literacy and education for boys deriving from their diverse Hindu, Buddhist, and Islamic religious heritages and institutions. Buddhism, with an education system based on the monasteries, was firmly established in Burma, Thailand, Laos, and Cambodia. Islamic schools existed in the Malay Peninsula and Indonesia. In Vietnam, Confucian principles derived from China underpinned a highly systematized pattern of education. Only in the Philippines is there little evidence of such a tradition of religious education.

The initial contacts between Western-style education, both Christian and secular, and these earlier educational traditions varied from one society to another. In Thailand, the only country not to be colonized, the reformist King Chulalongkorn (r. 1868–1910) used the Buddhist monastic schools as the basis on which to graft his modernizing Western-style education system. Elsewhere, traditional religious education was

gradually displaced as increasing opportunities became available to gain a modern Western-style education and as families saw the potential economic advantages that it gave their children in the colonial economy.

Until the latter half of the nineteenth century except for Thailand, Christian missionaries played the major role in establishing Western schools for the small European populations and local elites in Southeast Asia. By the late nineteenth century the growing Chinese minority populations also began to provide schools for their own children. Both missionary and Chinese schools, which were concentrated in urban areas, operated independently and did not provide a common system of education. Financial constraints shaped colonial education policies, since the colonies were intended to provide wealth to their colonial masters rather than to be an economic burden. Specifically, this meant limiting funding given to education and schools. Initially, among British administrators, there was also a concern to avoid the emergence of an alienated class of educated unemployed as was perceived to have happened in India.

However, by the end of the nineteenth century the potential for education to provide the skilled workers required in the colonial economy as well as to be a mechanism for managing the colonies' ethnic diversity led to greater direct involvement by the colonial administrations in providing and controlling schooling. Supporting these interventions were philosophically based policies such as the French *mission civilisatrice* (civilizing mission) and the Dutch Ethical Policy, which was adopted in the Dutch East Indies after 1900.

Debates about the language of education—whether teaching should be done in the local language or in the colonial language—played an important part in the formulation of colonial education policies. In Burma (Myanmar), British administrators adopted policies based on extensive English-language education. However, British administrators in the Federated Malay States and the Straits Settlements believed that this policy had led to a large overeducated population that was dissatisfied with the traditional way of life and unable to find employment in the relatively small, Western-oriented urban

economies. Instead, they settled on a policy of vocationally oriented vernacular primary education for Malay students. However, for the Malay elite, who were to provide the core of Malay colonial administrators, they established the Malay College at Kuala Kangsar in 1905. It was modeled on Eton and intended to groom the country's leadership. The government played only a limited role in establishing English-language schools for non-Malays. The Chinese established their own schools, while the children of Indian plantation workers were educated in vernacular primary schools, which plantation owners were required to fund.

This pattern was also replicated in French Indochina and the Netherlands East Indies. The Dutch increased opportunities for Dutch-language schooling, although the majority of children were educated in vernacular schools. In Indochina, the 1917 Code of Public Instruction was a key expression of education policy and practice. In the rural areas, a system of vocationally focused village primary schools that used the vernacular evolved. In Vietnam, Quốc Ngữ, or romanized Vietnamese, replaced the traditional Chinese characters for Vietnamese; this was a means to distance the new schools from the traditional ones. In the higher levels, French was introduced.

The Philippines under U.S. control from 1898 followed a different path. Although the Spanish administration had promulgated educational decrees in 1863 and 1865 applying to primary and secondary schooling, little progress had been made to implement these policies. When the Americans established civilian control of the Philippines in 1901, they rebuilt the education system using English and patterning the organization, curriculum, and methods of instruction on those in the United States.

A CRITIQUE OF TRADITIONAL EDUCATION

"Here [in colonial Southeast Asia prior to the twentieth century], as everywhere formerly, we find the gift of letters associated with religion and the traditional culture. The small boy learning to recite Pali verses, the little children learning their folk-dances are not being taught how to make a living in the modern world, but how to live as Burmans, or rather, as people used to live in Burma before it came into contact with the modern world. The system was intensely practical in the sense of fitting them for life, but not at all practical in the modern sense of enabling them to earn a livelihood. . . . In Indo-China, the French found few illiterates, but their education was of no use 'pour les besoins de la vie pratique' [for the practical needs of everyday life]. In the Malayan countries there were Koran schools, but the pupils studied only the Koran."

Education in Latin America after Independence

In the sixteenth century the Roman Catholic Church began the process of formal education in the Americas, with the primary goal to Christianize the indigenous populations. The Dominicans, Franciscans, and later the Jesuits established many of the first schools in Latin America. In time, as the number of Spanish settlers increased, the Catholic Church also established schools for the Spanish and mestizo populations, including

universities in Santiago, Chile; Quito, Ecuador; Cordoba, Argentina; and Mexico City. Indians were also students and in some instances faculty in the colonial universities. The colonial universities were open only to males.

In the first decades after independence, the Catholic Church remained the dominant force in education. This dominance was eventually challenged by the demand of citizens for reforms that included modern methods and secular education. While the Church continued to have a role in education, it lost its monopoly. By the end of the nineteenth century the educational systems in most of the countries of Latin America had been secularized.

Argentina provides the best example of the secular transformation of education in the second half of the nineteenth century. Domingo Faustino Sarmiento (February 15, 1811–September 11, 1888) was an educator and president of Argentina (1868–1874) whose leadership and vision resulted in Argentina's premier public education system. Sarmiento fled to Chile in 1840 due to his opposition to the Argentine dictator Juan Manuel Rosas. While in Chile, Sarmiento served as the director of a new normal school, an institution that trained teachers. Later the Chilean government sent him to Europe and the United States to study educational methodology. Sarmiento discovered the work of the U.S. educators Horace and Mary Mann and was soon convinced that their theories regarding public education were superior to what he had seen in Europe. Sarmiento returned to Chile and wrote two important works: *About Public Education* and *Schools as the Basis of Prosperity and Republican Government in the United States*.

In 1855 Sarmiento returned to his native Argentina and became the director of education for Buenos Aires Province. In this post he became a crusader for universal public education for both men and women. He proposed a modern curriculum that included science, vocational arts, and physical education. During his tenure (1856–1861) he opened 34 new schools and oversaw the publication of new textbooks. However, his ideas concerning secular education for women met with vehement opposition from the Catholic-controlled Society for Charity. As minister plenipotentiary to the United States

(1864–1866) Sarmiento renewed connections to U.S. educators, including Mary Mann (Horace died in 1859) and toured many teachers colleges and universities.

When Sarmiento became president of Argentina in 1868, he made educational reform the hallmark of his administration. Sarmiento established a network of teachers colleges, recruited U.S. teachers to work in Argentina, and revised the curriculum nationwide. He also implemented kindergarten and founded public libraries. Sarmiento's successors continued and expanded his reforms, resulting in the preeminence of Argentina's public education system in South America.

Mexico attempted to reform its education system during the presidency of Benito Juárez (1855–1870). Juárez appointed Gambino Barreda as head of a commission to reorganize Mexico's schools. The result was *Leyes orgánicas de la educación pública* (Organic Laws of Public Education). These laws, passed in 1867 and 1869, mandated free secular public education. Barreda proposed a new curriculum based on the educational philosophy of the French positivist thinker Auguste Comte. The new field of study emphasized the physical and social sciences. Barreda devoted his energy to founding the Escuela Nacional Preparatoria (National Preparatory School) and served as its first director. Mexico's educational reforms were less extensive than Argentina's and never became available to the majority of Mexican children. When the Mexican Revolution started in 1910, most of Mexico's school-age children had no opportunity to attend school.

Chile was also progressive in reforming education in the nineteenth century. In Ecuador there was tension between Liberals and Conservatives over education. For example, the Conservative president Gabriel García Moreno (1861–1865 and 1869–1875) advocated parochial schools funded by the state and administered by various Catholic orders. The Liberal Eloy Alfaro (1895–1901 and 1905–1911), on the other hand, favored state-funded and state-controlled secular schools. Brazil's education system was strongly influenced by the Church throughout most of the century.

During the colonial period 31 universities were established in Latin America. Most were modeled after the University of Salamanca,

which was founded in Spain in the thirteenth century. Latin American colonial universities were chartered by the Crown and administered and staffed mostly by Catholic clergy. Enlightenment philosophies of the late eighteenth and early nineteenth centuries challenged the intellectual underpinnings of the colonial universities, but they remained largely unchanged when the wars of independence started in 1810. The wars of independence did not fundamentally change the structure of the existing universities, but the new republics replaced the Crown as the chartering authority. The first national university was the University of Buenos Aires, founded in 1821. In Mexico the Royal and Pontifical University, founded in 1551, was nationalized but suffered frequent closings. The National University of Mexico was not founded until 1910. Latin American universities in the nineteenth century focused on law and medicine, with these respective branches dominating the institutions. Students at the universities were mostly males from the Creole elite. In the latter half of the century the influence of Positivism resulted in changes, including expanded state control and new curriculums based on both pure and social science. The scholastic approach of nearly 300 years was abandoned. Another development was the creation of normal schools to train teachers to meet the needs of the expanding public school system in many countries.

Public Education in Europe and the Americas

Prior to the late eighteenth century, schools in Europe and the American colonies were primarily private or run by churches. This changed in

the eighteenth and nineteenth centuries, when the growth of nationalism and democracy, secularization, social change resulting from the Industrial Revolution, and the realization of the value of an educated populace contributed to the widespread development of public education. Democratic and national values encouraged nations to create and standardize public education, mostly for primary grades, and create secular (particularly non-Catholic) schools. In the nineteenth century school curricula expanded from basic reading and writing to one that emphasized character building, discipline, and preparation of students for successful careers and citizenship. Largely because of public schools, by the early 1900s levels of literacy in most of northwestern Europe, the United States, and Canada reached 90 percent or higher, and in other parts of Europe and the Americas percentages were heading in that direction. Education beyond the primary grades was increasingly becoming the norm.

During the eighteenth century, there was general agreement among leading European intellectuals and rulers that some sort of plan for teaching basic literacy was a worthy object for governments intent on preparing their subjects to make contributions to the nation's social, political, and economic progress. More than a dozen states, among them Prussia, Denmark, Sweden, Austria, Poland, Bavaria, and Portugal, devised plans for systems of national education but, with one notable exception, never went beyond the planning phase. The exception was Prussia, where King Frederick II (r. 1740–1786), supposedly appalled by the illiteracy he found among Prussian troops during the Seven Years' War, issued an edict in 1763 that required compulsory schooling for boys and girls from 5 to 13 or 14 years of age. During his reign a chair of pedagogy was founded at the University of Halle in 1779, and a year after his death in 1787 school administration was centralized under a national school board.

In France, the revolutionary government drew up ambitious plans for a national system of education in the early 1790s, including the establishment of teacher training schools, but little was accomplished. Napoleon (1769–1821) also proclaimed the right to universal education, but

➤ HORACE MANN, FATHER OF AMERICAN PUBLIC EDUCATION

Horace Mann (1796–1859), lawyer, senator, and educator, is known as the Father of American Public Education and was instrumental in transforming state charity schools, designed for children in poverty, into a universal free public school system made up of what Mann called “common schools.” He was passionate that public education be nonsectarian, supported by state taxes, and open to children of all classes, religions, and backgrounds.

Mann grew up in poverty with limited schooling, but after educating himself and spending some time with a private tutor, he was admitted to and graduated from Brown University. He then completed his law degree in 1823 and served as state representative and senator of Massachusetts. Mann was a great believer in education as the right of every child and as being essential in improving the lives of children and society as a whole. In

1837 he became Massachusetts’s first secretary of the State Board of Education.

Among his many achievements, Mann campaigned for state school improvement; helped to establish a state mental hospital, “normal schools” (teacher training schools), and free libraries; and supported efforts to build new secondary schools, increase teachers’ salaries, and promote funding and availability of student materials. He influenced education beyond his home state and was instrumental in improving national public education. As editor of the *Common School Journal*, he wrote yearly reports on a variety of topics that argued the benefits of an educated population, revealed the successes of the model Prussian school system, and rationalized the use of taxes to develop public education. His efforts helped to pass the Massachusetts Compulsory Attendance Statutes in 1852.

—Kim Kennedy White

in practice his national education system was designed mainly to serve the upper classes. In 1814, the restoration of the monarchy left education again under the control of the Catholic Church. Free compulsory education became available in France only in 1881 and 1882, when laws were introduced by Jules Ferry (1832–1893), the minister of public instruction. In other parts of Europe, public education also took hold. The Casati Act of 1859 gave responsibility for primary education to individual towns in the Italian states (and later unified Italy in 1861). Scandinavian countries were in the forefront of providing compulsory education; for example, Sweden offered mandatory and free schooling for children aged 7–14 in 1842, and Denmark’s “common schools,” or public schools, were established in 1894 for primary students. The British government first became involved in public education in 1833, when Parliament provided money to build schools for poor children. The Forster Act of 1870 introduced the concept of state-funded education for primary students and established a system of local school boards with the responsibility of building and running nondenominational schools, raising funds, and subsidizing church schools. The Education Act

of 1872 provided public schools in Scotland. The Elementary Education Act of 1880 enforced compulsory school attendance for children 5–10 years old. Further legislation increased the age when students could leave school to 13 years old, and in 1902 the school boards were replaced with Local Education Authorities, still in use today, that provided a school system for both elementary and secondary education funded mostly by local taxes.

In the United States, support for the concept of public schools goes back to the era of the American Revolution. Thomas Jefferson (1743–1826), a lifelong advocate of public education, believed that educated citizens were critical for a successful government. Following the signing of the Declaration of Independence in 1776, 13 states had their own constitutions, 7 of which provided for public education.

Only in the mid-1800s, however, were concrete steps taken to provide for universal, state-funded, and compulsory education. Massachusetts (1852) and New York (1853) were the first states to pass laws for compulsory public elementary schools, and others soon followed. By 1900, most states required elementary-aged children to attend school.

From the late 1800s to 1914, progressive reformers saw public education as a way to “Americanize” immigrant children by instilling values that would produce productive American citizens. After 1900 more children attended high schools, and industrial and vocational programs provided incentive for more working-class students to complete their secondary education. Schools began to expand their curricula to include physical education. Reformers such as John Dewey (1859–1952) argued that education is a critical component of democracy and that the curriculum should do more than deliver knowledge; education should also be experiential. Furthermore, educational opportunities expanded for children of color. At the turn of the century, African American and white students had roughly the same attendance rates, although most schools continued to be racially segregated.

In Canada, the development of secular public schools differed for each province. Canada’s constitution, the British North America Act of 1867, gave provinces authority over education, and by the end of the nineteenth century elementary education was compulsory. In South America, discussions about public education were part of a larger ongoing debate about the role of the Roman Catholic Church in society. An important step was taken in Mexico during the late 1860s when, during the presidency of Benito Juárez (1806–1872), laws were passed to provide for compulsory, free, and nonreligious primary education. Other countries in Latin America developed national education systems and were typically based on European models. Brazil’s Constitution of 1824 strived for public elementary education for all citizens (but it was not achieved until later), Uruguay’s Law of Common Education was passed in 1877, and Argentina established compulsory public education in 1884.

The Evolution of Newspapers in Europe and the Americas

Although the dissemination of Gutenberg’s printing press in the late 1400s and the 1500s encouraged the issuing of religious tracts, broadsides, ballads, confessions of criminals, and other printed ephemera, the first daily newspapers did not appear until 1660 in Germany, 1677 in Paris, and 1702 in England. They developed from earlier “news books” or “news sheets” that were published irregularly or on a weekly basis, offering accounts of foreign news and discussions of local politics.

As literacy increased in the industrial era, the demand for news increased, causing innovations in reporting and relaying news through new technologies. During the eighteenth and nineteenth centuries the number of newspapers increased dramatically. The number of European news titles in 1750 was 183, rising to 522 in 1800. There were 980 titles in 1825, 2,044 in 1835, 10,964 in 1885, and 18,647 in 1914. By comparison, newspapers in the United States amounted to 18 in 1760, 359 in 1810, 861 in 1820, and 1,403 in 1830. In the 1830s when Alexis de Tocqueville visited the United States from France, he remarked on how many newspapers were available to American readers. In the United States, the number of newspapers reflected high literacy rates, which in 1800 were 90 percent in some areas. By this time, there were more American papers per capita than in Europe. As the nineteenth century continued, American newspapers eclipsed European papers in the number of titles. In 1885 there were 13,494, and in 1911 there were 22,806.

New technologies made important contributions to increased newspaper production. Europeans at first dominated the technology and manufacturing of improved printing presses. Earl Stanhope's invention of iron-framed presses around 1800 and Friedrich Koenig's steam-powered cylinder press in 1811 assisted in the ease and speed of imprint production at the turn of the nineteenth century. By the 1840s and 1850s, rotary presses allowed for an unprecedented number of imprints per day. For example, American inventor Richard Hoe's rotary press could produce 2,000 sheets per feeder each hour. Newspaper companies took advantage of these technological advances. In 1820 seven of the eight steam presses in London were used by newspapers.

Public participation in politics contributed to the content of newspapers. During the wars for independence in the Americas, newspapers were a means of public dialogue and of instilling nationalism. Isaiah Thomas's *Massachusetts Spy* and Benjamin Edes and John Gill's *Boston Gazette* sought to instill revolutionary fervor. Colonial newspapers that supported the British cause, such as James Rivington's *Gazetteer* in New York and John Mein's *Boston Chronicle*, lost public support and went out of business. Venezuelan revolutionaries Simón Bolívar and Francisco de Miranda took inspiration from the American revolutionaries' use of newspapers. Bolívar especially was interested in using newspapers to sway public opinion against Spain. Beginning in 1809 revolutionaries in Mexico and Chile skirted Spanish restrictions on the press by publishing political newspapers aimed at independence. Later in the nineteenth century abolitionists in the United States depended on newspapers to gain support for their cause, particularly William Lloyd Garrison's *The Liberator*.

Political party presses, paid for by subscription, in the United States and Britain not only gave local, national, and international news but also added commentary that favored a political party. While not specifically owned by the party, partisanship could lead to some funding support and the awarding of other printing contracts. In 1808 in the United States, about 80 percent of the existing 329 newspapers were party-aligned.

Politics was not the only form of content. By the 1780s, nonpolitical news in many English newspapers outweighed political content. More emphasis on fashion, literature, and the theater attracted readers' attention. Sports also entered the content of newspapers. During the 1760s, the English paper *Chelmsford Chronicle* began reporting race results. In the United States, reports of horse races and cricket games became a fixture in the 1830s. By the 1850s, prize fighting frequently appeared in the news, followed by baseball in the 1870s and football in the 1890s. As news of sports increased, newspapers began offering sporting news in its own section with a distinct writing style. Also, throughout the nineteenth century illustrations and "cartoons" developed into comics.

Advertising was also a major source of revenue for newspapers, allowing prices to remain low for readers. Advertisements were present in the newspapers of the seventeenth century. For example, in Germany in the eighteenth century, government-regulated newspapers known as *Intelligenzblätter* emerged, some of which depended on advertising revenue and small print runs (of 500 to 1000 on average). Throughout the eighteenth century and most of the nineteenth century, advertisements were often on the front pages of newspapers. However, as publishers sought to capture readers' attention, front-page news became necessary, and advertisements were relegated to the back page. For example, the penny papers were a long-standing format for inexpensive daily news; by the mid-nineteenth century many of these in the United States relied largely on revenues from numerous patent medicine advertisements. In the late nineteenth century, new dailies with huge circulations emerged in the United States that largely depended on revenue, instead, from department store advertisements.

How news was gathered was revolutionized by the development of the telegraph in the 1830s and 1840s. Soon editors were using the new technology to relay and acquire information from distant places. The speed of reporting news became even more important during the latter half of the nineteenth century when communications empires competed against each

► NEWSPAPER COMIC STRIPS

Comic strips such as the “Katzenjammer Kids” had become a fixture of newspapers by 1915, so much so that nearly all major newspapers in the United States had one in their syndicate systems. The ancestors of the comic strips are the woodcut illustrations used on broadsides at the dawn of the printing age in the fifteenth century. Smaller woodcuts, and later engravings into metals like copper, were assimilated into newspaper content in the forms of mastheads and illustrations. Seventeenth- and eighteenth-century newspapers often reused woodcuts as illustrations for various purposes. Even after the development of photography—but before methods for printing photographs were developed—specialists often rendered versions of photographs into enhanced woodblock illustrations in nineteenth-century periodicals, such as the *Illustrated London News* and *Leslie’s Illustrated Weekly*.

The earliest cartoons to appear in newspapers were often caricatures of political figures. For example, political cartoons in the United States began to appear in the 1830s as opponents of Andrew Jackson sought to attach Jackson’s likeness to their criticisms of his policies. European uses of cartoons also focused on political or social commentary. German artist Wilhelm Busch (1832–1908) is credited as the inventor of the modern comic strip. Beginning in 1859, Busch contributed comics to the leading German weekly newspapers. His popular “Max und Moritz” introduced continuous characters. Busch’s comic was so popular that French and Austrian publishers began to

publish plagiarized versions of Busch’s originals. “Max und Moritz” would also inspire the German American cartoonist Rudolph Dirks (1877–1968) to create one of the most successful comic strips in history, the “Katzenjammer Kids.”

During the intense competition between Joseph Pulitzer and William Randolph Hearst around 1900, both publishers introduced comics to gain readers. Pulitzer began in 1894 with the first full-color page to include a comic strip. The comic strips in Pulitzer’s newspapers, however, lacked a continuous character that readers could identify. That distinction belonged to two important comics of Hearst’s media empire. Richard Outcault (1863–1928) introduced the first American continuous character, “Yellow Kid,” to American readers in 1896. From this character and the sensational news reporting of Hearst’s papers the term “yellow journalism” came to be widely used. Outcault also revived the speech balloon, an element that had waned at the end of the eighteenth century. While it had a character and dialogue, this comic had little narrative and was only a single large panel. In 1897 the “Katzenjammer Kids” combined continuous characters, speech balloons, and regular panels. The “Katzenjammer Kids” was immensely popular but ran only two or three times weekly. Daily comics began in 1907 with “Mr. A. Mutt” by Bud Fisher (1885–1954), appearing in the *San Francisco Chronicle*. “Mutt,” a black-and-white comic, ran six days each week, serving as the archetype for daily black-and-white comics in American newspapers.

—Barton Price

other. The telegraph was instrumental in the consolidation of news groups that shared news stories. Charles-Louis Havas founded the Agence France-Presse in 1835. Havas’s news service later used the telegraph to provide news to various French newspapers. His employees Julius Reuters and Bernhard Wolff started news services in England and Germany, respectively. The Associated Press (AP) was formed in 1848 as a result of an agreement among the *New York Sun*, the *Herald*, the *Tribune*, the *Express*, the *Courier and Enquirer*, and the *Journal of Commerce*. This media cartel received European news arriving by ship in Boston, where agents relayed

news by wire to New York. Editors of the AP papers claimed rights to the news and sold items of news to nonmember editors. Later the AP leased Western Union lines to Washington, D.C., and Chicago to further extend the network of news exchange. At the close of the 1850s, the joining of the Magnetic Telegraph Company, the Electric Telegraph Company, and Julius Reuter’s news service monopolized the distribution of news from Reuters in the British Empire. Around 1900, other newswire associations such as the United Press Associations, founded in 1907 by Edward W. Scripps, and the International News Service, founded in 1909 by William Randolph

Hearst, competed with the AP for control of telegraphic lines and of news stories.

Media moguls such as William Randolph Hearst and Joseph Pulitzer offered innovations to newsprint formats and newspaper reporting as a result of fierce competition for readers. Hearst, who introduced color print to newspapers, is most famous for his tactics of yellow journalism during the “paper wars” with Joseph Pulitzer in 1896–1898. By 1935, Hearst had 26 daily newspapers in 19 cities and operated two news services. Pulitzer developed New Journalism, a form that included larger headlines and sensationalist exposés of urban ills as well as more pages, news, and illustrations as a way to attract readers. In addition to founding United Press Associations (later United Press International), Edward W. Scripps founded the first American newspaper chain, which included 34 newspapers in mid-sized cities in the Midwest and toward the Pacific coast. In England, Lord Northcliffe (1865–1922) built his media empire by acquiring the *London Evening News* (1894) and the *London Times* (1908) and founding the *Daily Mirror* (1903).

By the early 1900s newspapers were a significant social and cultural force that provided information, opinion, and even entertainment for millions of individuals. Along with mass-circulation books and periodicals, newspapers with their mass circulation, reliance on new technologies, and ability to both cater to and shape public tastes, provided an early foundation for what would later be termed mass culture.

Books and Reading

In 1792, London bookseller James Lackington reported in his memoirs that four times the number of books were being published and sold that year as had been 20 years earlier. He observed that even “the poorer sort of farmers and even poor country people in general” were now gathering their families on cold winter nights to read “tales and romances” rather than telling “stories of witches, ghosts, and goblins.” The bookseller’s impressions have been confirmed by historians, who have described the eighteenth century as a period in which reading became a popular everyday activity.

Historians ascribe this change to a number of factors, including a rise in literacy rates, improved standards of living, increased leisure, the commercialization of the publishing industry, and the Age of Enlightenment’s faith in the power of knowledge and reason as the source of progress. During the eighteenth century books increasingly were transformed from rare, treasured possessions into widely distributed texts with contents shaped by the tastes of the bourgeoisie and, if the London bookseller Lackington is correct, even the “poorer sort of farmer.”

Literary journals, such as the *Tatler* (1709) and the *Spectator* (1711), religious tracts, political tracts, semipornographic smears of enemies and even of the French royal family, reference works including Denis Diderot and Jean d’Alembert’s *Encyclopédie*, satiric novels such as Voltaire’s *Candide* (1759), and scientific journals that published research for natural philosophers and also instrument makers, along with broadsides and newspapers, all cultivated the interests of a growing reading public and, when necessary, eluded barriers set down

by government censors as politically incendiary or obscene.

Books were as much weapons as forms of entertainment. Political pamphlets, such as Thomas Paine's *Common Sense* (1776) and *The Rights of Man* (1791), proved the revolutionary potential of Enlightenment thought, as both writings inflamed the passion for liberty that erupted in both the American Revolution and the French Revolution. The violent excesses of the French Revolution created backlashes in America and Europe, leading to the suppression of newspapers, pamphlets, and books as well as the suppression of societies such as the Free Masons connected to secularism and freethinking. Following the Napoleonic Wars as Europe regained stability, censorship control receded. However, books continued to be censored if they were regarded as overly bawdy or licentious.

In the nineteenth century, along with rising public literacy and education, book and periodical production became industries advanced by new technologies, including rotary steam presses, stereotyped plates, and cheaper methods of making paper and bookbindings. Improved roads and railroads made it cheaper and easier to distribute printed material of all sorts from big-city publishing centers to small towns and villages. Industrial production offered cheaper copies of books as well as periodicals and newspapers, which competed with books for readers. Even families that were far from well-to-do could afford a small collection of books. Chapbooks were hawked on the streets, and numerous periodicals carried serialized fiction from authors such as Charles Dickens and Fyodor Dostoyevsky, with book volumes soon following. Authors such as James Fenimore Cooper, Walter Scott, Victor Hugo, and Charles Dickens were translated into a variety of languages and earned a wide international following. Indeed, the novel developed alongside the growth of the middle class in Europe and in America.

Literacy and reading habits were not limited to the upper or middling classes. Industrialization and urbanization required a literate workforce. In Britain, Germany, France, Italy, the United States, and elsewhere, whether motivated by a socialist agenda to ensure the dignity of workers or the republican theory that the

voting public must be well informed and "virtuous," reading came to be viewed as a means of self-improvement. Science was a topic of widespread fascination, reflected in the nineteenth-century public's taste for lectures, books, periodicals, and science-related articles in newspapers. Newspapers and periodicals that catered to specific audiences such as women, African Americans, immigrant populations, and workers were also common by the late nineteenth century in the United States.

With the implementation of formal public education, there was an increase in the demand for educational texts. Compulsory education in France had begun in 1793 but did not become a reality until the 1880s. Some scholars have asserted that based on the ability to sign wills, literacy in the United States among property-owning males was close to 100 percent by the time of the American Revolution. Compulsory education laws were first enacted in Massachusetts (1852) and New York (1853), but it was not until World War I that most states provided compulsory free education. In Britain, compulsory education emerged via legislative reforms. After 1870, most of Europe had compulsory public education. Britain achieved 90 percent literacy rates.

Public education was enhanced when public lending libraries appeared in America and in Britain after 1850. Prior to this, libraries were private and not as accessible to working people (for example, the Library Company of which Benjamin Franklin was one founder in Philadelphia, 1731). Readers often shared books in reading circles or at home, and a single volume would often be read by several people. Novels were the most popular books distributed by subscription libraries. But as the popularity of lyceum clubs in early-nineteenth-century Britain and the United States indicates, with visiting lecturers offering perspectives on current knowledge, numerous topics such as philosophy, science, politics, spiritualism, and religion also intrigued the reading public. In the United States and Protestant Europe, the Bible was a perennial best-seller.

In Asia, the development of publishing in India was hindered by the great diversity of India's languages. During British rule, however, the introduction of modern printing presses in India's major cities (the first printing press had

been established in Goa by the Portuguese in the 1560s), advances in education, and increased use of local languages rather than Arabic, Persian, or Sanskrit led to the appearance of India's first newspapers as well as an Indian publishing industry that produced magazines, journals, Western works, works of social and political commentary, and works of fiction. Somewhat similarly, increased contact with the West and the adoption of the Tanzimat reforms of the mid-1800s gave rise to what is called the Tanzimat era of Turkish literature, in which publishing houses began producing print material in many different genres and forms, including many works geared specifically for reading by women and children.

China had a long literary and scholarly tradition connected to Confucian philosophy and the long-standing civil service exams that both gentry and some gifted commoners trained for, as passing these exams at different regional levels permitted employment in the government bureaucracy. Novels blossomed during the Ming period (1388–1644), with popular tales about bandits, judges, adventures, and erotica. At the turn of the eighteenth century, the city of Chengdu had 10 major publishing houses, Beijing had 100 publishing houses, and wealthy merchants established some free public libraries. From 1773 to 1783, under orders of the Qianlong emperor, the entire scholarly community helped compile *The Four Treasuries* (history, classics, philosophy, literature), a compendium of knowledge in numerous fields of specialties that dwarfed the work of the French encyclopedists, their contemporaries, collecting together 3,500 annotated works of knowledge in 36,000 volumes. Seven handwritten copies were created by scribes and housed as separate collections in various imperial palaces and in several libraries open to scholars. China's contact and conflict with Western powers in the nineteenth century also prompted the writings of the Self-Strengthening Movement, which argued for a balance between modernization (that is, Western influences, technologies, and weaponry) and tradition.

The Japanese, with their long history of artistic and literary excellence, were exposed to Western culture through Dutch trade and schools. During the Edo period (1603–1868)

printing flourished, and public tastes encouraged the wide circulation of printed material. Novels of the Edo period and the Meiji period (1868–1912) often included beautifully rendered color woodblock prints that folded out from the frontispiece pages. By the 1860s, Western influence thoroughly intersected with a literate culture in Japan. The *Kaigai Shimbun*, which provided Japanese readers with foreign news, began publication in 1865 at the end of the Edo period. Numerous other mass-circulation newspapers appeared in the decades that followed. *Bungei Kurabu*, a magazine for women, also became popular at the turn of the twentieth century. Reading Western works became a crucial practice as the Japanese in the Meiji era sought to avoid being overrun by foreign powers and to adapt Western technologies and learning so as to position Japan as a regional and world power.

Public Libraries

Although libraries have existed for several thousand years, they were reserved for the higher social classes and took the form of private, school, or research libraries. The first public libraries were established in Great Britain, North

America, and Australia in the late nineteenth century. Technological advances in printing, a growing middle class that increasingly valued knowledge and education, and improved literacy rates contributed to the growing popularity of public libraries during this time.

Today, public libraries provide citizens with reference materials for information, learning, and entertainment and are considered essential to a literate and educated population. Unlike other types of libraries, public libraries are noncommercial book-lending institutions, supported by taxes and private donations and open to any citizen who wants to use them, and contain a mix of popular and scholarly materials.

The public library movement can be traced to the nineteenth century, when many middle-class and working-class Europeans came to view libraries as a source of enlightenment and social progress. They demanded access to books, pushing for libraries that were financed and administered by local or national governments and open to all. Support for libraries was strongest in Great Britain. France, Germany, and other continental states established the first fully democratized public libraries at the end of the nineteenth century, almost a full half century after Great Britain.

In the 1840s, the leading supporter of public libraries in Great Britain was William Ewart, a member of Parliament from Liverpool and an ardent social reformer. He introduced bills to Parliament on this issue beginning in the 1840s, and despite opposition from those who opposed the idea of using public funds to pay for libraries that would be mainly used by the working classes, the Public Libraries Act was approved in 1850. The bill gave boroughs in England and Ireland the right to collect taxes to open and maintain public libraries in towns with populations larger than 10,000. Manchester opened Britain's first public library in 1852. The Public Libraries Act of 1853 included Scotland. By 1914, Britain had more than 300 public libraries.

During the mid-nineteenth century, public libraries were also developed in the United States. Public libraries were established because of generous donations from influential people such as multimillionaire John Jacob Astor, philanthropist James Lenox, politician Samuel J.

➤ ANDREW CARNEGIE AND AMERICAN PUBLIC LIBRARIES

Scottish-American Andrew Carnegie (November 25, 1835–August 19, 1919) was a businessman, major philanthropist, and lifelong book lover. Among many other accomplishments, Carnegie is known as the “Patron Saint of Libraries.” The Andrew Carnegie foundation financed the construction of nearly 1,700 public libraries in the United States from 1900 to 1917, each displaying a variety of architectural styles. Carnegie also funded libraries in Great Britain, Ireland, Scotland, Canada, Australia, New Zealand, Serbia, the Caribbean, and Fiji.

Carnegie's first library opened in 1883 in his hometown of Dunfermline, Scotland. In 1889 he opened his first public library in the United States in Braddock, Pennsylvania, home to his major company, the Carnegie Steel Company. During segregation, African Americans did not have access to public libraries. Carnegie funded separate libraries for African Americans such as Houston's Colored Carnegie Library. He strongly believed that with hard work comes success and that libraries provided essential opportunities for learning.

—Kim Kennedy White

Tilden (who were all essential to the founding of the New York Public Library), international financier Joshua Bates (who funded the founding of the Boston Public Library), and Andrew Carnegie (the steel magnate who funded libraries across the United States). The first municipal public library to allow people to check out materials at no cost to take home and use was the Boston Public Library, opened in 1852. One of the most important public libraries in the United States, the New York Public Library, established in 1895, involved the consolidation of several libraries—the Astor (opened in 1849) and the Lenox (opened in 1870) libraries, both privately owned, and the New York Free Circulating Library (established in 1878)—and the support of the Tilden Trust. In 1876, two notable events occurred: the founding of the American Library Association, with nearly 103 librarians, and the publication of a book on the classification of library materials by Melvil Dewey, the inventor of

the Dewey decimal system. During the last half of the nineteenth century, women's clubs, through donations and fund-raising, established two-thirds of the country's libraries. Public libraries were supported by these organizations, public tax money, and philanthropists like Andrew Carnegie. By 1910, the United States had more than 1,000 large public libraries (libraries that housed at least 5,000 books).

During this period, public libraries were also established in Canada, Australia, and New Zealand. In 1779, Governor Frederick Haldimand, concerned with a lack of resources and ignorance among his citizens, founded the first publicly funded Canadian library in Quebec City. In Australia, the New South Wales government bought a bankrupt subscription library and opened the first free public library in 1869 in Sydney. The explosion of public libraries in colonial New Zealand was remarkable. Local settlers in Wellington established the first public library in 1841. Between 1840 and 1914, the settler population in New Zealand grew to just over 1 million, and nearly 770 public libraries were founded; a third of them were created from 1840 to 1874, and two-thirds were created between 1875 and 1914. Public libraries opened in both urban and rural areas, and New Zealand achieved the highest number of libraries per capita of any nation.

Public Museums

The emergence of the first public museums is a European phenomenon. From the princely and aristocratic cabinets of curiosities (or wonder

rooms) of the sixteenth and seventeenth centuries to the public museum as experienced in the twenty-first century, there exists a long history of continuous reshaping, which has affected dramatically the identity, role, and function of this institution. The process of transformation from an elitist establishment to a publicly accessible site is strongly associated with the social, political, and cultural contexts of each period and country.

In the middle of the eighteenth century, the intellectual and philosophical underpinnings of the Enlightenment valued encyclopedic knowledge and the ability of human reason to organize this knowledge according to general principles. In this context, the purpose of collecting was geared toward systematic classification and exhibition according to scientific guidelines. The accumulation of natural and man-made curiosities gradually shifted to ordered groups of objects. The foundation of the first public museums took place in the middle of the eighteenth century. At that point, the definition of the museum became tied to the specific building that housed collections for public view. Private collections, sold or bequeathed to public museums, formed the core of these institutions. Yet what was "public" remained ambivalent, since access was initially intended for respected groups of the upper middle class and the aristocracy on an intermittent basis. The British Museum in London was the main example of the transitional phase from private to public viewing of collections.

The British Museum, which was founded in 1753 by an act of Parliament, was on the threshold of the process of democratization of museums. Following the acquisition of the collection of natural history specimens, coins, books, and manuscripts of Sir Hans Sloane (1660–1753), a physician to the Duke of Albemarle, the British Museum opened to the public in 1759. Soon after that, numerous private collections were acquired by the museum. In its early years of operation through the first decades of the nineteenth century, admission was permitted for a few days per week following a written application of the potential visitor.

The Louvre Museum in Paris, France, was founded in 1793; it was then that the new French republic transformed the palace of King Louis XVI and royal collections of art into a

public museum with free access to every citizen. The museum was significantly enriched by the treasures amassed during the victorious campaigns of Napoleon (1769–1821) in European cities up to 1815. The establishment of the Louvre initiated a series of subsequent transformations of royal art collections into public museums around Europe and the United States.

Public museums of the nineteenth century were defined as safeguards of the national heritage and as critical instruments for the construction of national identities. The first public institution in the United States, the Smithsonian Institution in Washington, D.C., today a complex of museums and research centers, was established in 1846 by the generous endowment of a British gentleman, James Smithson (1765–1829), who had never visited the United States himself. Other national museums founded during that century were the Prado Museum in Madrid, Spain (1819); the National Gallery in London (1824); the National Archaeological Museum in Aegina, Greece (1829); the Alte Pinakothek in Munich, Germany (1836); the Hermitage Museum in St. Petersburg (1852); the National Museum in Montreal, Canada (1843); the American Museum of Natural History (1869); the National Museum of Denmark (1892); and the Victoria and Albert Museum in London (1898). Municipal museums flourished in major cities as tools for popular instruction and recreation, such as the Yorkshire Museum in York (1822), the Philadelphia Museum of Art (1876), the Walker Art Gallery in Liverpool (1877), and the Manchester Museum in England (1890).

What had started in the middle of the eighteenth century as a site for the nobility had become a site for the social erudition of the working class by the late nineteenth century. Yet the outbreak of World War I (1914–1918) gravely impeded the development of museums toward fulfilling their social role and educational potential.

WORLD EXHIBITIONS

World exhibitions grew in parallel to nineteenth-century public museums. Unlike public museums, however, these exhibitions had greater ease of access and themes that related to industrial arts and their application to everyday life. World exhibitions mingled a wealth of products from both European countries and the colonies celebrating iron and the steam engine. The organizational scheme of such displays positioned the exhibits in such a way as to be viewed according to two modes of classification—country and subject—in a round space that allowed visitors a direct engagement with objects.

In Europe, international exhibitions took place mainly in London (1851, 1862, 1871–1874, 1883–1890, 1895, and 1896) and in Paris (1855, 1862, 1867, 1878, 1889, and 1900). The *Great Exhibition of the Works of Industry of All Nations* that was held in the Crystal Palace in Hyde Park, London, from May 1 to October 15, 1851, was the first world exhibition.

Public Art Galleries, 1750–1900

The term “public art gallery” (or “public art museum”) refers to an institution collecting and publicly displaying works of art as well as the building where the display is located. This cultural medium had its formative period in eighteenth- and nineteenth-century Europe. Art collections in antiquity (such as those in Pergamon, Egypt, and Rome) and throughout much of history served as means of dynastic legitimization and representation; only a few collections, such as medieval church treasuries, were

➤ GALLERY

Architecturally derived from the medieval knight's halls, a gallery was a long hall-like anteroom in palaces generally connecting the state apartment (a set of grand rooms elaborately decorated for representative purposes) with other (ceremonially) important rooms. Seventeenth- and eighteenth-century galleries like that of Versailles, Vienna-Schönbrunn, or Potsdam-Sans Souci became large and sumptuous architectural features in the residences. They generally had one long wall with a row of big windows, giving excellent lighting to the room and making it perfect for displaying artworks. The term "gallery" was later used to refer to large painting collections and included the building as well as the institution. The Uffizi in Florence, originally built between 1559 and 1581 to house bureaucratic offices (*uffizi*), had a "galleria" on the upper floor displaying works of art. This is probably the origin of the term "gallery" as a reference to an architectural setting displaying artworks.

—Angela Opel

publicly accessible. The earliest known example for a specific artistic interest in collecting is the treasury of Jean Duc de Berry (1340–1416) in the late fourteenth century, which was also the time of the earliest examples of cabinets (exhibition rooms) of art and curiosities and cabinets of *naturalia* (works of nature) as forerunners of modern museums.

Collecting in early modern times was marked by the emerging interest in artifacts of antiquity and subsequently in the aesthetic qualities of contemporary art. From the fifteenth to the seventeenth centuries, art collections were formed and maintained by a number of rich and powerful families and individuals. During the Italian Renaissance in the 1400s, the Medici of Florence, the papal court in Rome, the Este family of Ferrara, the Gonzaga of Mantua, and the Montefeltro of Urbino were all notable collectors. In northern Europe, prominent collectors were Archduke Leopold Wilhelm of Austria (1614–1662) in Brussels; King Charles I (1600–1649), Thomas Howard, the Earl of Arundel (1585–1646), and George Villiers, First Duke

of Buckingham (1592–1628), in England; Cardinal Richelieu (1585–1646) and Cardinal Mazarin (1602–1661) in France; and Queen Christina (1626–1689) in Sweden. Collections maintained by princes and kings were generally displayed in the gallery or in the state apartments, which was a set of grand rooms for use by the sovereign.

In the eighteenth century these galleries were separated from the ceremonial rooms to other parts of the residence and finally were separated from the residence altogether. This began with the first autonomous gallery building exclusively displaying artworks, the "art house" of Johann Wilhelm, elector of the Palatinate in Düsseldorf, in 1712. In addition, due to changing views of art and education during the Enlightenment, galleries were opened to more segments of the general public starting in the late eighteenth century. Besides art's aesthetic qualities, Enlightenment philosophers and poets such as Friedrich Schiller (1759–1805) stressed its potential to edify and enhance man's humanity. The exhibition of artistic collections themselves changed from a decorative focus to an educational and didactic approach in that art was arranged according to artists, artistic schools, or regions. This was first attempted in 1700 at Salzdahlum Palace near Braunschweig and then systemized at Düsseldorf in 1763.

Art galleries/museums, the earliest specialized form of public museums, in many cases developed out of the arts departments of multidisciplinary museums. Ultimately, however, the conceptualization of the museum emanating from the French Revolution (the *Muséum Français* in Paris), which stressed the separation of art and nature, prevailed over the multidisciplinary structure of many early foundations such as the British Museum (1759).

The earliest public art galleries include the Palais de Luxembourg in Paris, where during 1750–1779 the Medici paintings of Peter Paul Rubens were publicly displayed, followed by the Oberes Belvedere in Vienna (1781) and *Muséum Français* in Paris in 1793 (later called the *Museum Central des Arts* and the *Musée Napoleon* in 1803). The main formative period of public art galleries, however, was between 1830 and 1914, starting in Europe with *Alte Pinakothek* in Munich (1836) and the *New Hermitage Museum*

in St. Petersburg (1839) and in the United States with the Wadsworth Atheneum in Hartford, Connecticut (1842).

Whereas in Europe some museum foundations were underwritten by governments (e.g., the Altes Museum in Berlin, founded in 1828) and others by wealthy members of the bourgeoisie (Städel Museum in Frankfurt/Main, founded in 1817), in the United States and Australia museums were founded and funded mainly by private individuals. Museums that originated from private initiatives include the oldest public art museum in the United States, the Wadsworth Atheneum; the Metropolitan Museum of Art in New York City, which focuses on world art; and the Bendigo Art Gallery in Bendigo, Victoria. In other parts of the world, for example, in former colonies such as India, public art galleries were mostly founded in the twentieth century, following earlier nineteenth-century foundations of archaeological or colonial public museums.

Kindergarten Movement

The term “kindergarten” (German for “children’s garden”) refers to an institution for children ages four to six that is based in Friedrich W. A. Fröbel’s (1782–1852) theories of early childhood development. In contrast to religious teaching about original sin, Fröbel saw the child

An educator and theoretician concerned with discovering and fostering the growth of inner, spiritual forces of human development, Friedrich Fröbel of Germany is best known for pioneering the kindergarten system. (Library of Congress)

as inherently good and innocent; he believed that all education should start with sense perception and stimulation of interest in learning. Fröbel divided childhood from ages one to six into distinct stages—infancy, early childhood, and childhood—and suggested that each developmental stage requires specific educational challenges and environments.

Fröbel believed that at age four children should no longer be educated by their parents alone but should be entrusted to a kindergarten, which was to provide an environment of playful learning and allow children to gather together with their peers. His ideas quickly became identified with liberalism and even revolution by both many of its proponents and, more importantly, German governments. The concept of kindergarten challenged traditional ways of child rearing (in families) and also traditional views of women and motherhood. Furthermore, many of the supporters of kindergartens were liberals who played a part in the 1848 Revolution. Teachers from Thuringia even petitioned the Frankfurt Assembly to consider the kindergarten as an element of a new and democratic system of public education.

Following the defeat of the revolution, the concept of kindergarten education was considered politically dangerous and a threat to traditional religious doctrines. Kindergartens removed children not only from the private sphere of the family, which was seen as the normal and religiously defined space for child rearing, but also from previously church-dominated institutions of child rearing. Prussia was the first of the German states to ban all kindergartens in 1851 (the ban was lifted ten years later). Since many of the kindergarten educators had to leave

➤ MARGARETHE SCHURZ AND THE FIRST AMERICAN KINDERGARTEN, 1856

In 1856 Margarethe Schurz (1833–1876) opened the first American kindergarten in Watertown, Wisconsin. She was born Margarethe Meyer into a well-off family of Hamburg, Germany. Margarethe and her sister Bertha (later Bertha Ronge) were introduced to Friedrich Fröbel and his new concept of kindergarten during the 1840s. After Bertha had established the Hamburg College for the Female Sex, she made sure that Margarethe attended this new school, where Fröbel lectured in 1849–1850. After a nervous breakdown Margarethe traveled to London, where she lived with her sister and brother-in-law. Here she met Carl Schurz, whom she married in 1852. After their immigration to the United States, Margarethe Schurz created in late 1856 or early 1857 a kindergarten, conducted in German, to care for her own and her neighbors' children in Watertown, Wisconsin. In 1859 Boston transcendentalist and educational reformer Elizabeth Peabody (1804–1894) learned about Schurz and her kindergarten. Peabody decided to open her own kindergarten in Boston in 1860, although she insisted that all instruction was to be in English. Thus, she translated the German concept of the kindergarten into the American kindergarten.

—Thomas Adam

Germany and go into exile, they took the idea of the kindergarten with them to other European countries and North America. From here the kindergarten idea spread all over the world.

In 1851 the German emigrés Johannes (1813–1887) and Bertha Ronge (1818–1863) opened the first kindergarten in London. While the success of the kindergarten movement in England was limited in numbers and influence, it fared much better in the United States and Australia. In the United States kindergartens spread quickly throughout the country, especially in cities such as Chicago, New York City, Milwaukee, Philadelphia, and St. Louis, which had large German immigrant populations. By the 1880s, however, most American cities had kindergartens and even training schools for kindergarten teachers.

German emigré Margarethe Schurz (1833–1876), the sister of Bertha Ronge and the wife of Carl Schurz (1829–1906), the famous German American politician and general of the American Civil War, opened the first American kindergarten in Watertown, Wisconsin, in the autumn of 1856. Instruction was conducted in German, and the focus was on play. In the following years the idea was quickly adopted by middle- and upper-class Americans who saw the advantages of Fröbel's ideas for early child education. However, Fröbel's ideas first needed Americanization. Elizabeth Palmer Peabody (1804–1894) assumed a leading role in translating Fröbel's ideas and thus creating an Americanized version of the German kindergarten. This Americanized version embraced urbanization and took city life as the starting point for its curriculum. German songs and embrace of a romanticized view of nature were replaced by a focus on the life experience of American children, academic instruction, and preparation for school.

In Australia, Edward Combes (1830–1895), a New South Wales member of Parliament, took the lead in advocating kindergartens. Combes had visited kindergartens in France, Austria, Belgium, Sweden, Great Britain, and the United States in 1880 as part of a mission to investigate the conditions of schooling in these countries. His *Report on the Lighting, Heating and Ventilation of School Buildings in Great Britain, the Continent of Europe, and America: With Remarks on School Discipline, Normal Colleges, and the "Kindergarten" System* (1880) included a section on the kindergarten and thus was the first publication on Fröbel's idea in Australia.

China introduced the kindergarten concept indirectly via Japan through Japanese translations of European literature. Kindergartens in Japan were mandated by the state but were introduced at the local level by villages as part of the modernization of the education system in the 1870s. American missionary Annie Lyon Howe (1852–1943) founded the first kindergarten in Kobe in 1889. She made Fröbel's principles the basis of her kindergarten and instructed kindergarten teachers in a special training school. Howe's kindergarten was the prototype for all further Japanese kindergartens. Around

1900 Chinese intellectuals and officials advocated the introduction of the kindergarten from Japan. Chinese rulers copied verbatim Japanese regulations with regard to preschool education, and the terms adopted by Chinese educators derived from the Japanese language. *Mengyangyuan*, the word used for kindergartens in China, means “the institute for nourishing young children.”

■ Introduction: Food and Drink

Food preparation changed after the Industrial Revolution. Prior to 1750, most food in Western countries was cooked over an open fire in a fireplace, and drinks such as beer were brewed at home. One hundred years later, trains with refrigerated cars carried fruit and slaughtered beef, and English travelers carried Schweppes carbonated beverages with them throughout the world. Stoves and cookbooks became common, as did restaurants in which diners could choose from different options on a menu. World trade made tea, coffee, sugar, and name-brand beers into commodities available around the globe. Canned and bottled food and “invented” foods such as bouillon and breakfast cereals (“shredded wheat,” for example) were introduced in the second half of the nineteenth century along with advertising campaigns. Food and drink helped mark identity; some also became political battlegrounds. In the United States, abolitionists were often health food faddists who preferred to stay in special “Graham Hotels” that could offer them the appropriate food and the company of like-minded clients. Throughout the nineteenth century and the early twentieth century, religious revivalists and social reformers launched temperance campaigns in Britain and the United States. Often these involved the targeting of immigrant populations, such as Germans and Irish in the United States. The Indian Mutiny of 1857 was triggered in part when rumors were spread that the rifle cartridges that the Hindu and

Muslim soldiers were being issued, which they had to break open with their teeth, were greased with beef and pork fat. While more food and varieties of food were available to more people, the industrialization of food production had obvious drawbacks. In general, industrial workers were too impoverished to benefit and frequently suffered from malnutrition. While vegetarian health food faddists such as the Grahamites and their preference for a diet based on whole wheat, beans, and a variety of unsalted gruels may appear somewhat quaint, their concerns may have been rational. In an unregulated market, the adulteration of food with additives that ranged from harmless (though fraudulent substitutes) to quite poisonous was common. Examples of adulteration common to the nineteenth century include the use of sawdust as a filler in bread, chicory in coffee, or the addition of dangerous chemicals to beer to improve the color or foaming properties. Likewise, disease and contamination were common in meat products as a result of unsanitary conditions in slaughterhouses and meatpacking facilities.

—Fred Nadis

New World Foods in Nineteenth-Century India and Southeast Asia

While having a profound effect on the diets of Europeans, the migration of food species from the Americas as a consequence of the Columbian

➤ NEW WORLD FOODS AND LANGUAGE

The cultural diffusion of New World foods can be traced through their etymological derivation in Asian languages. Portuguese words for the pineapple (*ananas*), guava (*peyara*), and papaya (*pepe*) have been retained in the north Indian languages. Variations of indigenous American words such as *caju* (cashew), *tomatl* (tomato), and *camotl* (sweet potato) are found in many local vernacular languages from India to the Philippines.

—Adrian Carton

Exchange also radically transformed agricultural practices and eating habits in India and Southeast Asia. In an uneven process of diffusion and adoption, New World foods such as maize, potatoes, pineapples, cashew nuts, peanuts, papayas, capsicums, and chilies were introduced to the region by different waves of Portuguese and Spanish explorers from the sixteenth century. The impact of these foods on South and Southeast Asia can be seen in terms of their nutritional importance and their cultural transmission through culinary and linguistic adaptation. In significant ways, New World foods permanently changed Asian eating habits while also consolidating broader ecological transformations.

The association between peppers and Asia is such that most Europeans continued to believe well into the nineteenth century that the chili originated in India. Botanists confirm, however, that the genus *Capsicum* originated in the Americas. The Portuguese facilitated the transport of New World foods to Asia via the Lisbon to Goa route in the early sixteenth century, while the Spanish galleon route from Acapulco to Manila in the later sixteenth century offered another pathway of diffusion. Hence, India and the Philippines became the main arteries by which these new foods entered the Asian diet. Their journey was not always direct, however, but instead was the result of multiple migrations. For example, the cultivation of maize was introduced by the Portuguese on the west coast of Africa in the sixteenth century, and from there it traveled to the east coast of Africa and eventually to India. The papaya was introduced to

the Philippines by the Spanish, and from there it traveled to Southeast Asia and then eventually to India through the trade networks of the Portuguese. Some New World foods, such as the pineapple, were seen in the markets of Mughal in north India in the late sixteenth century, well before their appearance as exotic delicacies in England. Others, such as the tomato, were late-comers and came to India from Europe in the nineteenth century.

The peanuts that make a classic Malaysian satay sauce and the chilies of staple Indian dishes are therefore foreign imports that were unheard of in that part of the world before the sixteenth century. Sweet potatoes and maize were also significant contributors to a nutritional and dietary revolution. Originally only eaten by Europeans and Muslims in India, both the sweet potato and the white potato became important sources of nutrition in areas with soil too poor to sustain other crops. In Southeast Asia, moreover, sweet potatoes were also important as a filler crop between rice harvests to sustain populations where rice was not seasonally available.

Likewise, maize acted to diversify Asian crops. The vernacular term *makkai* (“Mecca corn”) in north Indian languages seems to suggest an association with the Mughal empire and an early adoption of this American food source on the subcontinent. By the nineteenth century it had a widespread distribution in India, where it was a supplement for the poor in the highlands of the Himalayas and in areas such as the Punjab. In present-day Indonesia maize has also become the most important secondary crop as land suitable for rice production has grown scarce. In the face of increasing population pressure, the cultivation of maize was particularly lucrative in the highlands of Java, a region generally unsuitable for rice production.

Therefore, by the late nineteenth century, sweet potatoes and maize radically transformed traditional sources of nutrition in India and Southeast Asia. New World foods were also valuable additions to a system of crop rotation whereby peanuts, chilies, and potatoes were often rotated with older crops such as eggplants and sugarcane. The long-term consequences of the introduction of New World foods on the region are subject to debate, but some general

trends seem certain. Ecological historian Alfred Crosby supports the view that the diversification of the rice harvest with American food crops enabled greater populations to be supported in the vegetarian societies of India and Southeast Asia by the nineteenth century.

Food Policy in Meiji Japan

Japan's state-level food policy has always centered on the production and distribution of rice. State control of food in Japan took place in a real sense only in 1942 at the height of World War II as the food supply drastically dwindled. However, ordinances from the imperial courts started as early as 675 CE, when according to the *Nihonshoki* (Chronicles of Japan), Emperor Temmu issued ordinances to encourage rice production and prohibited the consumption of meat from five beasts: cows, horses, dogs, monkeys, and chickens. The motives behind the prohibition included the Buddhist doctrine of mercy for all living beings and the use of rice in ritual meals and funerals, when puffed rice is used to symbolize rice that cannot be grown again. The taboo against killing animals was reinforced by the notion of defilement incurred by death, either of a human or of an animal, in Japan's native Shintoism. In reality, the prohibition of eating meat was also to protect rice agriculture, in many ways the basis of Japan's rural economy and the major source of taxation.

During the Meiji Restoration the prohibition against meat consumption was officially removed. In 1871 Emperor Meiji issued an

ordinance for food consumption at the imperial palace to include beef, mutton, pork, venison, and rabbit meat, and he publicly ate meat on January 24, 1872. French cuisine became the official meals for public entertainment at the imperial court.

There were two forces that prompted the state policy on food during the Meiji period. The first was the regime's goal of seeking "Civilization and Enlightenment" (*Bunmei Kaika*) by imitating the West. Eating meat was associated with progress and modernization, so when one ate meat, one was symbolically "ingesting" the West. Not all Japanese agreed with the new policy. For example, some members of the *yamabushi* (ascetic Buddhist mountain hermits) came to the palace on February 18, 1872, to appeal to the emperor to restore the prohibition on meat eating. During the scuffle with the palace guards, four of the *yamabushi* died, one was seriously injured, and the rest were arrested.

DISCOVERING VITAMIN B1

When Takaki Kanehiro proposed a link between a diet of polished white rice and beriberi, vitamin B1 had yet to be discovered, and hence he attributed the disease to a protein deficiency. In 1897 Christiaan Eijkman (1858–1930), a military doctor in the Dutch Indies, theorized that there was a nerve poison in the rice endosperm from which the outer layers of the grain gave protection. Another Dutch doctor, Gerrit Grijns (1865–1944), concluded that the outer layers of the grain contained an unidentified essential nutrient. In 1910 the Japanese chemist Suzuki Umetaro succeeded in extracting a water-soluble complex of micronutrients from rice bran and named it aberic acid. He published this discovery in a Japanese scientific journal, which, when translated into German, failed to state that it was a newly discovered nutrient, a claim made in the original Japanese article. Hence, his article was largely ignored. In 1911 the Polish scientist Casimir Funk (1884–1967) published the results of his research in which he isolated the same complex from rice bran and called it a *vitamine*. In most accounts he is still given credit for formulating the concept of vitamins.

—R. Kenji Tierney

Meat eating was encouraged by leading intellectuals such as Fukuzawa Yukichi (1835–1901), the influential author, educator, translator, and founder of Keio University. In 1882 he wrote an article in which he discussed why meat should not be prohibited on nutritional grounds. In 1890 he wrote that Japan was not suited for rice cultivation, and thus the people should eat meat and rely on foreign rice.

The second important factor that encouraged meat consumption was the state's commitment to building a strong military. The slogan "Rich Country, Strong Army" led to the adoption of Western cuisine, dried bread (*kanpan*), and meat by the military. Initially Western cuisine was introduced by the Japanese navy in order to build the "soldiers' body" that could compete with the body of meat-eating Westerners. This diet also served to reduce the high incidence of beriberi, a severe nervous disease now known to be caused by vitamin B1 deficiency and often associated with a diet of polished white rice. In 1884 Takaki Kanehiro, a British-trained physician in the Japanese navy, observed that beriberi was common among Japanese sailors, whose diet consisted largely of white rice, but was nonexistent among Western sailors, who included meat in their diets. Takaki performed controlled experiments using two battleship crews, and the results convinced him and Japanese naval officials that dietary changes were necessary, including the consumption of meat along with rice, vegetables, fish, and wheat. The army, however, adhered to the rice diet at the advice of Mori Ogai, a medical doctor and a well-known novelist. The superiority of the navy's diet was proved during the Sino-Japanese War (1894–1895) and the Russo-Japanese War (1904–1905) when the army lost many soldiers to beriberi while the navy lost hardly any.

While Japan's engagement in its imperial wars necessitated a large food supply to feed its military, many of the soldiers had been drafted from the farming areas, which resulted in a reduced labor force for production at the moment of increased demand. Thus, starting with the latter part of the Meiji period, each prime minister began issuing more explicit food policies, with a focus on the distribution of rice (*shokuryo seisaku*). They emphasized self-sufficiency in rice

agriculture and regarded abundant food as a sign of patriotism.

Preserving Food—Bottling and Canning

Women had known about the techniques of bottling and artificially preserving foods long before the Industrial Revolution. Before the 1790s, housewives were well aware that covering cooked meats with fats had the effect of preserving meat. This technology was later applied to potting fruit syrups and conserves in what were called viall glasses. Machinery, however, revolutionized this technique. Credit for this goes to Nicolas Appert (1749–1841), whose invention of canning (known as bottling in England) was a response to the need to supply food to soldiers fighting the Napoleonic Wars (1799–1815). Canning was based on two ideas: fully corking a vessel filled with food trapped in a *bain-marie* (water bath) and heating its contents with the aim of dispelling all the air. Initially glass jars were used, but eventually these were replaced by the tin can. In England, Bryan Donkin (1768–1855), in collaboration with others, established a factory for canning food such as boiled and cured beef, carrots, mutton and vegetable stew, veal, and soup to meet the navy's demand for preserved provisions to sustain their medical stores.

The use of glass bottles to contain preserved foods continued. By the turn of the eighteenth century, there were 37 glass houses in London producing bottles mainly for wine and medicine. The glass bottle also made its way to the United States, where it was more commonly used than the tin can. William Underwood

(1787–1864), having worked as an apprentice in pickling and preserving in a London house, took off for New Orleans, Louisiana, in 1817, and beginning in 1820, in collaboration with a partner, he established a factory bottling fruit such as damsons, cranberries, currants, and quinces and later included jams and jellies, ketchups, pickles, and sauces.

Partly owing to the fact that business was slow in the United States, the technique of bottling also was introduced to South America when Underwood and his partner began aggressively exporting their goods to the rest of the world. Other markets for their products were the Dutch East Indies, Gibraltar, India, Hong Kong, Manila, and the West Indies, where they were marketed under an English brand name. In 1835 the company started to export tomatoes to Europe after importing the seed from England. Little effort went into marketing the fruit in the United States, as it was commonly thought at that time that the tomato, a member of the nightshade family, was poisonous, although it had been long domesticated in the New World and eaten in Europe.

English sauces also were made available in large quantities owing to the technique of bottling. Worcestershire sauce is an example. It has been said that when the former official of the East India Company, Lord Marcus Sandys, returned from India in the 1830s, he turned over the recipe of one of his favorite Indian sauces to two local chemists, John Lea and William Perrins, in the hope that they would replicate it. Originally known as Worcester sauce because the first factory producing the sauce was set up in Bank Street in Worcester, this condiment was an instant success; from 636 bottles sold in 1842, sales increased to 30,000 bottles in 1855.

Although the bottling of foods was more popular initially in the United States, the American Civil War (1861–1865) changed this, giving way to a cheaper alternative: the tin can. The first few cans were produced with a rather primitive technology. Cans were manufactured from rolled sheets of wrought iron onto which was placed a top that was hammered in and soldered on all sides. Lifting the lids from early cans was impossible until a ring was fitted around the lid.

By the middle of the nineteenth century, the soldering process was eliminated by a machine that pressed out the top and bottom of a can. The technique of canning was improved further with the discovery that calcium chloride added to the water bath increased the temperature, thus reducing the boiling time of the food from five hours to half an hour.

Fish was a major canned food product. A competitor to Underwood and his partner was the American Thomas Kensett, who learned of the technique of canning from his father-in-law Ezra Doggett, an English immigrant. They established a factory in New York that canned salmon, lobsters, and oysters. Although Kensett patented the tin can in 1825, it became widely used only in 1839.

The canning of fish also took off in Europe. Nantes, France, was the birthplace for the canning of young pilchards, otherwise known as sardines. Soon the industry spread to Brittany, and by 1870 the canning of fish was a flourishing trade. The success of this trade continued, and by 1880 50 million cans of sardines were produced annually in France, with at least 3 million exported to Britain. Soon similar factories sprouted in Cork, Ireland, and in Aberdeen and other parts of Scotland, making it possible for frozen and smoked salmon to reach the London markets.

In the United States, large-scale canning factories packing fish developed in 1864. The technique of canning also led to the easy availability of other products, such as condensed, evaporated, and powdered milk. Patents for evaporated milk and powdered milk were filed in 1847 and 1855, respectively.

Curiously, the canning of meat as an industry did not develop to such a large scale. Canned meat was used by armies fighting the American Civil War and by the Anglo-French forces in the Crimea, but in the domestic market the preference was for frozen meat owing to the invention of refrigeration. In the United States in the 1850s, the first refrigerated rail car transported butter from Ogdensburg, New York, to Boston, Massachusetts; soon the refrigerated rail car was transporting frozen meat from Chicago to cities on the eastern seaboard.

Food and the Industrial Revolution—Production and Marketing

The Industrial Revolution involved more than the manufacture of textiles, steel, and steam engines. Novel developments in the production and distribution of foods transformed eating habits. The use of machinery to produce foods, new techniques of preserving and extending the shelf life of foods, retailing and wholesaling, and new railway systems allowed for large quantities of foods to be distributed to more people than had ever been possible before. Manufacturing foods in large amounts was possible only with the use of machinery at every stage of production: washing, grading, separating, peeling, chopping, and packaging.

Beginning in the 1800s, breakfast became the first meal in the Anglo-American world transformed by industrialization with the introduction of cereal-based foods. The development

of cereal-based foods first occurred at Battle Creek, Michigan, in the 1880s when physician John Kellogg (1852–1943) experimented with cereals in an attempt to provide natural and healthful foods to Seventh-day Adventist vegetarians. At this time, the majority of people ate breakfasts heavy on fatty foods and light on grains, although a growing number of people were determined to further the vegetarian cause. Kellogg himself wanted to find a way to help his patients solve their digestive problems with fiber-rich grains. Boiling the grain did not render satisfactory results; instead, Kellogg rolled corn meal, baked it, and hence invented cornflakes. Years later an ex-patient of Kellogg's, Charles W. Post (1854–1914), experimented with the techniques of flaking, puffing, toasting, and extrusion, producing Grape-Nuts in 1898, followed by Post Toasties (originally called Elijah's Manna) in 1908. An innovative businessman, Post advertised his products as "Health foods to well people." Others in the same league include Henry Perky (1843–1906) of Denver, Colorado, who invented Shredded Wheat in 1893.

Other new foods were also created. A technique for making meat extract from stock that was later dehydrated was developed in France, and by 1830 meat bouillon was available as so-called bouillon bars in pharmacies. Later, factories producing meat bouillon for the growing European market emerged in Uruguay. With the spread of this technique, factories producing meat bouillon also appeared in Argentina, Australia, New Zealand, and North America.

Other traditional foods formerly prepared by women in home kitchens continued to appear in grocery stores. In Britain, one example was Hovis bread, dating back to 1886. Richard "Stoney" Smith (1836–1900), having successfully found a way to retain the wheat germ in flour, wanted to find a more consumer-friendly name to market the flour and announced a national competition. The winning name was *hominis vis*, Latin for "the strength of man," from which the term "Hovis" originated. Advertising spread the Hovis brand, starting with the cycling boom in the early twentieth century when the company produced road maps directing cyclists to venues where they could inflate their tires at no cost, find lodging overnight on their long cycling

trips, and, of course, find bakeries where Hovis bread was sold. In the 1920s Hovis signs appeared above bakery storefronts, and the famous slogan “Don’t say brown, say Hovis” appeared on television in the 1950s. Newer forms of advertising have ushered the Hovis brand name into the twenty-first century, as their breads are touted to be nutritious and beneficial to health.

Biscuits (cookies in the United States) were another mass-produced food. For more than 150 years, Fox’s in Britain had been producing everyday family favorites enjoyed by millions. Older still is the brand Huntley and Palmers. Thomas Huntley, who owned a bakery, had the brilliant idea of hiring an employee to deliver his biscuits to waiting passengers at the Crown Hotel opposite his shop. His idea paid off, as customers began requesting that their local groceries stock Huntley’s foods. In 1841 Huntley was joined by his cousin George Palmer, and within 50 years their biscuits sold not only across Britain but also across the world.

Since the beginning of the Industrial Revolution, mass-produced foods increasingly have made their way into homes. Four factors, however, are instrumental in the growing popularity of industrial foods over time: branding, packaging, advertising, and marketing. Mass-produced foods displayed on the shelves of grocery stores are always sealed in attractive packaging and stamped with a label. The packaging of many mass-produced foods conveys the same message: foods are wrapped in clear plastic and are well sealed to prevent contamination. Mass-produced foods also spell consistency, predictability, and reliability in terms of quality, and only the use of machinery could have brought about the production of standard foods on a large scale.

It was advertising and marketing, however, that were essential in promoting some brands over others. Women became the targets of aggressive advertising tactics as factory-made foods were repeatedly advertised as time-saving, nutritious, and pure because they have been produced in sanitized environments. The Industrial Revolution also spurred the retailing industry in the second half of the nineteenth century. The neighborhood grocer was replaced by duplicate food shops across the country: the chain store. Thomas Lipton (1848–1931) opened

his grocery shop in Glasgow, Scotland, in 1872; after 26 years, 245 branches had been established. Across most developed and developing countries in the world today, chain supermarkets are the norm.

At the onset of the Industrial Revolution, mass-produced foods were expensive and purchased only by travelers and explorers or exported to British outposts. In due course, these foods appeared at the dinner table of the different social classes as economies of scale made it possible for them to be sold at cheaper prices. For the working class, this facilitated the transition from rural to urban living. For them, purchasing mass-produced foods eased the possibility of urban living because of their competitive prices.

Industrial foods have another advantage in that they can be stored and consumed at any time within the period of expiration. Although the techniques of pickling and preserving may have been discovered before the Industrial Revolution, machinery paved the way for large quantities of such foods as well as for many others to be produced. Stocking up on mass-produced foods not only eliminated the need for daily shopping but also meant that seasonal food and fruit usually eaten only at certain times could now be enjoyed throughout the year.

The Invention of the Restaurant in France

Public places where one ate food in exchange for payment have existed in other cultures, such as in eleventh-century China, but the use of the term "restaurant" reflects the emergence of a dining experience that is anchored very much in a specific time and place. It was invented between 1765 and 1782 as a result of the social,

economic, and political changes that occurred in tandem with the collapse of the old regime in France. While public inns and taverns in France served food and refreshments to ordinary people in exchange for payment before and after the invention of the restaurant, the latter became a symbol of public dining for the urban bourgeoisie in Paris, from which it was transported to the rest of the world.

Originally, *un restaurant* was a term that appeared in the sixteenth century to refer to a small bowl of medicinal broth prepared by reducing meat down to a rich stock, which provided a restorative meal for those with a weakened constitution caused by illness or incapacity. In 1765 A. Boulanger opened what could arguably be called the first restaurant in Paris since it was the first urban public space for the consumption of these restoratives. Restaurateur's rooms, often called *maisons de santé*, subsequently emerged all over Paris as places where these medicinal broths, but not food, could be consumed for a price.

In 1766 Mathurin Roze de Chantoiseau combined an institution that sold restorative broths with a salon for political discussion and financial transactions. His philosophy that aiding the health of the individual through digestive restoration was akin to aiding the health of the nation is especially significant. It established a relationship between the restaurant as a social space where one restored one's health through the consumption of bouillons and the commercial affairs of the nation. Hence, the first Paris restaurants that emerged along the salon model were often citadels of public display where those with money to spare congregated to celebrate the art of consumption.

While these salons of health restoration were humble institutions, their increasing association with affluence saw a parallel demand for a wider variety of food choices from a wealthy clientele looking for culinary choice rather than medicinal aids. In 1782 Antoine Beauvillers opened what we would now recognize as a restaurant in the modern sense of the term. Calling it La Grande Taverne de Londres, he ironically needed to make the institution sound foreign to Parisians. Offering different types of meals listed

THE GRAND RESTAURANT

When Boulanger offered sheep's feet in white sauce as a restorative on his menu, he was sued by the guild of caterers, or *les traiteurs*, on the basis that such a dish was a ragout and not a sauce. They lost the case, and thus this decision opened the way for restaurateur's rooms to serve more than mere broth. After the French Revolution the abolition of the restrictive guilds, which monopolized the selling of food in Paris, meant that it became easier to open new places for public eating where a variety of different foods could be consumed together. The abolition of aristocratic privilege meant that cooks who were formerly employed in the private kitchens of wealthy estates found new vocations in luxury restaurants. By the early 1800s the concept of the grand restaurant had emerged. These establishments continued to use the à la carte menu but served several courses of often complex dishes. These included establishments such as La Maison Dorée, Véry, and Les Frères Provençaux. At Véry, for example, diners could choose from 6 kinds of soup, 8 kinds of hors d'oeuvres, 17 chicken or game dishes, 9 fish dishes, 7 roasts, and 4 desserts. Some of the most popular dishes in early Parisian restaurants included dishes such as *langue de boeuf fourrée* (beef tongue) and *dinde en daube* (braised turkey).

—Adrian Carton

on a printed menu from which patrons could choose their own personal favorites, Beauvilliers also seated customers at smaller and more individual tables. Whereas ordinary people frequented inns and taverns and paid a standard rate for basic fare on communal tables, the act of dining in a Paris restaurant was subsequently a political expression about the privileges of bourgeois status. It was this journey from restorative broth to citadel of gastronomic consumption that marked the invention of the restaurant.

Working-Class Diet in Nineteenth-Century Europe

For centuries, the primary dietary staple of laboring Europeans was home-baked bread. Grain was cheap, and bread was easy to make, filling, and fairly caloric and could feed a relatively large family. Peasants during the Middle Ages and the early modern era were at the mercy of the grain harvest, as the failure of a crop reduced the availability of grain for bread; any available grain became prohibitively expensive and was hoarded by the wealthier segments of society. Wealthier Europeans were never as reliant on bread, as they were able to supplement their diets with meat, fruits, vegetables, and luxury food items, all of which would provide nutrition in the event of crop failure. As hunting lands were generally reserved for the rich, poor Europeans suffering through famine had the choice between starving or risking harsh punishment, even death, for poaching. Though many rural poor were able to cultivate small vegetable gardens, these were not sufficient in the event of crop failure. In any event, though bread would keep workers alive, it

did not contain enough nutrients to ensure good health. As a result, workers' health suffered, and many died young.

By the nineteenth century, the diet of the European working class had begun to change. As one major example, throughout Britain the primary staple of wheat (bread) was giving way to less costly potatoes as the main staple. According to historian E. P. Thompson, weavers in England were especially hard hit by the Industrial Revolution, with many reduced to near or actual starvation on a diet that consisted of onions, potatoes, oatcakes, oatmeal, "blue" (or rancid) milk, home-brewed ale, and, as luxuries, tea, coffee, and bacon. In Limoges, France, in the mid-nineteenth century, the working-class diet consisted of potatoes, lard soups, cabbage, turnips, and pancakes. In the first decades of the nineteenth century, beer consumption among the working class in Britain went down as a malt tax made home brewing costly, while tea became the stimulant of choice for laborers. Sugar, whiskey, and gin consumption also increased.

Throughout the nineteenth century, European poor were increasingly moving into the overcrowded and unsanitary cities for work. Vegetable consumption declined, as tending a family garden became less common. Urban workers no longer had the room or the time to bake bread at home, so they had to buy it elsewhere. There were few if any health regulations in nineteenth-century European cities that addressed the baking of bread or the preparation of other foodstuffs. As a result, urban workers often consumed bread and other foods that were adulterated with harmful substances, often factory by-products put to new uses. Though meat consumption increased, slaughterhouses were notoriously unsanitary, and the trade-off of more protein for disease was usually on balance a negative one, particularly as modern medicine was still in its infancy.

The main culprits in adulterated food were the metal waste products of factories. Copper, lead, iron, aluminum, mercury, and even poisons such as strychnine found their way into food. Though rich Europeans also experienced the effects of food adulteration, the urban working class and poor were hardest hit. Sometimes

dangerous chemicals or other additives were added to food or drink on purpose for taste, preservation, or color. In addition, nineteenth-century cities had very poor sewer systems, and human waste would often collect in the streets, where it mixed with foodstuffs.

Fortunately, working-class food consumption improved by the end of the century due to several factors: improved sanitary and sewage conditions in the cities, better food-preservation techniques, increased availability of vegetables, greater health regulation of food production and in factories, and the invention of canned food. Even so, life expectancy among the working class was still many years less than “higher” sections of society well into the twentieth century.

The Cooking Revolution in the West—Cooking Ranges and Cookbooks

The nineteenth century witnessed a revolution in the way in which food was prepared. To some extent, this revolution was the result of urbanization but was also influenced by growing industrialization and reliance on technology. The replacement of an open fire as the main method of cooking food resulted in greater efficiency and also changed the dishes that were produced. Cookbooks with directions for cooking on stoves, standardized measurements, and tips for housekeeping and entertaining according to an idealized middle- and upper-class standard became the norm during this period as well.

Western society expected more refinement and elegance in its dining during this time.

Since the time when humankind mastered fire hundreds of thousands of years ago, food had been cooked over open flames. Disadvantages were many, including smoke, difficulty in maintaining temperatures, dangers from fires, and inefficiency. Different cultures searched for a method that allowed for more control over cooking. Ceramic and stone cooking stoves appeared in China by the second century BCE, but in Europe development lagged behind. For centuries, most cooking was done on hearths or braziers. Experiments with three-sided chambers that allowed easy access to the fire as well as a secure cooking surface were attempted. Between 1300 and 1600, increased use of iron permitted craftsmen to experiment with iron boxes to enclose a fire for cooking purposes. These innovations were largely limited to the households of wealthy individuals. By 1750, however, freestanding cast iron stoves were becoming more common, especially in North America and western Europe. Innovators like Benjamin Franklin helped to make such stoves practical and popular for heating. Before 1800, these stoves also were used by some for the primary purpose of cooking.

By the early 1800s, inventors in Europe and the United States introduced improved cooking stoves. In Britain, Benjamin Thompson invented the Rumford Stove, which had a large cooking surface that included openings in which to place pots to make better use of the heat. Individual fires, and hence temperatures, could be regulated by increasing or decreasing the draft at each opening. The Rumford Stove was efficient but too large for individual homes. An American named Philo Stewart used Thompson’s principles to develop the smaller Oberlin Stove, patented in 1834. The Oberlin Stove was very popular and sold an average of 3,000 units a year over the next 30 years. Although some households continued to use the traditional hearth, cooking stoves were popular because they were more fuel-efficient. By 1850, most urban American and European middle- and upper-class households had cooking stoves. A waist-high cooking surface reduced stooping

► FANNIE FARMER'S BOSTON COOKING-SCHOOL COOK BOOK

Fannie Farmer (1857–1915) is not only credited with writing one of the most internationally successful cookbooks in history but also with creating a standard that many cookbooks have since emulated. While in high school in Massachusetts, Farmer suffered a paralytic stroke. Unable to continue to college, she worked as a mother's helper after recovering. The experience of domestic life developed an interest in and aptitude for cooking in Farmer.

Farmer's parents helped her attend the Boston Cooking-School, under Mary J. Lincoln. The school was one of a number of cooking schools founded to train professional chefs. Such schools also tried to instill modern scientific principles about nutrition and hygiene among their students. Farmer graduated in 1889 from the school and then remained as assistant director. She became director in 1894.

One of Farmer's accomplishments was to recognize that all housewives, especially middle-class ones, would benefit from these modern

ideas. Because not all women had the opportunity to attend a cooking school, Farmer revised Lincoln's *Boston Cooking-School Cook Book*. While the original was intended as a text for cooking schools, Farmer's edition was aimed at women in general. It was an encyclopedic book with over 1,000 recipes, arranged by categories. A busy housewife could easily turn to the chapter on soups and pick out the one she wanted. Other chapters covered beef, pork, fish, potatoes, and vegetables. Breads, desserts, sauces, and many other types of dishes were covered. Farmer's recipes were clear and explicit, giving standardized measurements for the different ingredients and cooking times. The cookbook also included household tips such as how to can vegetables, cleaning tips, and substitutes for certain ingredients. Farmer's cookbook went through multiple editions published before and after her death in 1915 and was translated into various languages, including Braille.

—Timothy J. Watts

by cooks. The stoves also usually had ovens, heated by hot air circulated from the firebox before it was vented through the chimney. Wood and charcoal were the most widely used fuels at first but were later replaced by coal, kerosene, and gas.

While early cooking stoves were improvements over hearths, they had drawbacks. The relatively small firebox required cooks to add fuel frequently, and the heat was also unevenly distributed on different parts of the cooking surface. Constant adjustment of dampers to control the fire and the need to move pots from hotter to cooler areas gave cooks little time for other tasks. Early ovens were also so small that few dishes could be baked. Inventors during the first half of the nineteenth century continued to introduce new features to meet women's complaints. Between 1820 and 1839, for example, 165 patents were issued for cook stoves in the United States. Features ranged from multilevel cooking surfaces at different heights on the

same stove, to keep from having to lift heavy pots very far, to a rotary cooking surface that moved like a turntable, to make it easier to maintain constant cooking temperatures.

Critics accused the cook stove of causing a breakdown of the family and traditional values. Nostalgic memories of the family gathered around the fireplace while meats roasted and a stew simmered over a roaring fire were popular in some literature of the period. The cook stove, located in an isolated kitchen, could hardly be considered the heart of the family, unlike the hearth.

Changing patterns of cooking based on the stove also contributed to the spread of cookbooks. Both printed and manuscript books of recipes and household tips had appeared during the medieval and early modern periods, but they were primarily intended for professional cooks. In 1796, *American Cookery* by Amelia Simmons, a former servant about whom little is known, appeared, making it the first cookbook

written by an American for an American market. Other cookbooks followed, with increasing emphasis on the use of ingredients native to North America such as cranberries, turkey, and corn instead of products found originally in Europe. Many cookbooks were aimed at the growing middle class. Beginning about 1850, cookbooks for cook stoves instead of fireplaces appeared. While some cookbooks included recipes for the health-conscious, such as vegetarians, more were for sweet dishes that required stoves. More cakes, candies, and other treats were made for the prosperous middle and upper classes. Other examples of changing diets included less roasted and more baked meat along with fried, instead of grilled, food. Cookbooks also instructed cooks in technical matters related to stoves, such as how to maintain constant cooking temperatures by regulating the fires. Housewives also received tips on running a household according to middle- and upper-class standards and values. Much attention was given to table settings and entertaining to impress guests. Improvements in preserving foods, particularly the development of canning, enabled families with financial resources to serve a greater variety of foods at all times of the year. The first truly modern cookbook was *The Boston Cooking-School Cook Book* by Fannie Farmer, with standardized measurements and directions in the recipes, making cooking more of a science and less of an art.

An increase in the number of cooks and domestic servants employed in middle- and upper-class households was another feature of the cooking revolution in the nineteenth century. As the middle class grew in Europe and North America, middle-class households employed members of the lower classes to perform duties in their homes. The concentration of food preparation and cooking in the kitchen often kept the servants isolated from the family.

Wine and World Commerce

By 1750 the trade of wine had entered into global capitalist networks, while its production still maintained distinctive regional characteristics including the application of local agricultural techniques, the cultivation of different grape varieties, and the employment of particular wood types used for barrel making. The core of wine production in Europe stretched from the Iberian Peninsula along the northern Mediterranean coast and as far north as France's Loire and Germany's Rhine River valleys. Although wine had been produced in other parts of Europe and indeed other parts of the world for centuries, it was from this core that wine entered into global trading networks. The value of luxury wines as a marker of status was sparked by concurrent demographic changes in Europe, most notably the enormous growth of town and city life, yet the majority of wine produced prior to the 1800s remained of poor quality and was destined for local markets. In the nineteenth century the rapid growth of overseas colonies and more intricate trade networks generated an increase in viticultural production around the globe and also inspired technological innovations for the aging and transport of wine as well as the improvement of its quality.

During the 1600s viticulture was introduced into various non-European locations, including Latin America and southern Africa. These vines had been planted and cultivated by European settlers destined to either profit or simply earn a living from a familiar occupation. Two centuries later, this same combination of factors, along with the sheer determination of a few individuals, helped carry the vine into other new areas, including California, Australia, and New Zealand. Interestingly, it was often the wine importers and merchants of northern Europe, particularly the Dutch and the English, rather than the wine producers of southern Europe who introduced viticulture in the colonies of Africa and the South Pacific. In North America,

German and Italian immigrants were instrumental in the early cultivation of some of today's most recognizable vineyards, including those in Napa County and Sonoma County in California. Prior to the Oriental Exclusion Act of 1882 that barred Chinese immigration for ten years, Chinese laborers, often derogatorily referred to as coolies, built many barrel cellars, caves, and wineries, many of which still stand today on the West Coast of the United States.

The turn toward global viticulture had some unexpected consequences for traditional European producers. The dreaded phylloxera, an insect that feeds off the roots and leaves of vines, was inadvertently carried from the United States to Europe via returning colonists as well as ambitious scientists and winemakers in the 1860s. Many European vineyards, especially those in France, succumbed to diseases associated with phylloxera, fundamentally changing the social and economic structure of global viticulture. The majority of European vineyards had to be expensively and painstakingly replanted with resistant American rootstocks, a process that proved impossible for many small producers. Eventually, much of the world's vine-growing areas were in some way affected by phylloxera or its variants. Many pesticides and artificial nutrients were invented to help offset the negative effects of the scourge. Today, the use of artificial chemicals and synthetic procedures in winemaking remain controversial topics.

The greatest shift in wine culture from 1750 to the early twentieth century was the significantly higher level of capital invested in the production and storage of wine. The increasing costs of vine cultivation, in addition to the making and storing of wine, led to a decline in the amount of small family and peasant producers. Much of the needed capital was provided by *négociants*, or large-scale merchants, who were not dependent on an annual yield for their labor. In return, these merchants controlled many of the winemaking processes and distribution channels. If wine was still a tenuous product in global capitalist exchange in 1750, it was most certainly firmly entrenched by the 1910s.

—Kevin Goldberg

➤ NAPA VALLEY

The integration of wine production and wine sales is often necessary for success. This combination is usually aided by certain relationships built on trust and past experience; this often comes in the form of sibling kinship. The story of brothers Jacob and Frederick Beringer, immigrants to the United States from the German city of Mainz in the 1860s, is an example of how understanding both wine production and wine sales led to success. Jacob purchased and cultivated vines in Napa Valley, California, while older brother Frederick worked in New York selling and distributing Jacob's wine across the eastern seaboard and Europe. Today, Beringer still stands as one of the most recognizable names in the wine world.

Food and Health—Regulating Adulterated Food

With the rise of industrialization, the commercial manufacture of food became more centralized and took place on a much larger scale than ever before. As populations shifted into urban centers, more individuals lacked the time and facilities needed to produce their own food and instead relied on mass-produced staples. Although the availability of such items was convenient and a sign of the era's increased prosperity, much commercially produced food and drink contained misleading or even harmful ingredients. The struggle to expose and prevent such food adulteration became one of the most significant milestones in public health during the late nineteenth and early twentieth centuries.

An adulterant is any substance added—either accidentally or, more commonly, intentionally—to a food or beverage that is unwanted by or hazardous to the consumer. Adulterants were used to increase weight (by bulking up or adding water), cut costs (by replacing more expensive ingredients with cheaper substitutes), or make an item more appealing (by changing its appearance, taste, smell, or texture). Water, for example, was used to dilute milk and gin, while sawdust helped enlarge loaves of bread. Cheap rye or potato flour was often substituted for more expensive wheat flour, and ground tapioca took the place of cocoa powder in chocolate. Coffee (which often contained a large percentage of ground chicory) was made darker through the addition of burnt sugar. Although such adulteration was unscrupulous, other instances posed serious health risks. Bread was artificially whitened with chalk, and spent tea leaves and coffee grounds were reprocessed using animal dung. Brewers used a plant source of strychnine to increase the bitterness of their beer and added opium to make it more addictive. Red dyes commonly used in cheeses, cayenne pepper, and candy were made with lead and mercury, while green dyes were made from copper salts. Manufacturers added sulfuric acid to vinegar to increase its acidity.

Although in Great Britain a number of laws had been passed in the late 1700s and early 1800s forbidding the inclusion of certain

harmful substances in foodstuffs, there was no reliable way to test for adulterants, so the laws were difficult to enforce. Consumers were forced to rely on the honesty of the merchant. Scientific advances during the early and mid-1800s, however, made it possible for the first time to more accurately determine the composition of food and drink. Microscopes could clearly illustrate the differences between ingredients that might appear the same to the naked eye, and chemical reactions could detect the presence of certain toxic substances. For example, hydrogen sulfide, when added to a sample of food colored with lead or copper compounds, produced a black precipitate. Similarly, adding a solution of barium chloride to a liquid such as vinegar containing sulfuric acid would result in a white precipitate.

In Britain, Frederick Accum (1769–1838) was the first to raise the alarm about the adulteration of food. A German-born chemist working in London (and also well known for his work in connection with gas lighting), Accum developed many of the chemical tests used for identifying adulterants. In 1820 he published *A Treatise on Adulteration of Food and Culinary Processes*, which highlighted the many forms of adulteration and argued that such practices should be considered criminal acts. The treatise also listed the names and addresses of manufacturers that had been convicted under existing laws for producing or selling adulterated items. His book won the author a number of enemies. Although the book sold out quickly in Britain and the United States and a German edition published in 1822 also did well, Accum's career was cut short in 1820 by a lawsuit related to the allegation that he tore pages out of books at the Royal Institution (the members of which included many prominent businessmen) and took them to his home. Amid public scandal, he returned to Germany, and his work was quickly discredited and forgotten.

The issue of food adulteration was next taken up by Thomas Wakley (1795–1862), a surgeon, member of Parliament, and founding editor of *The Lancet*, a medical weekly newsletter established in 1823. In 1851 Wakley created the Lancet Analytical and Sanitary Commission, with physician Arthur Hill Hassall (1817–1894) as its head commissioner. Between 1851 and 1854

► COCA-COLA AND THE CRIMINALIZATION OF COCAINE

Cocaine, a central nervous system stimulant derived from the leaves of the coca plant, was a popular ingredient in many patent medicines during the late nineteenth and early twentieth centuries. Physicians had noted cocaine's usefulness as an analgesic, but less reputable sources claimed that it could cure everything from flatulence to cowardice.

Whether in cigarette, powdered, or injectable form, cocaine was readily available from a wide variety of companies, including Parke-Davis (once the largest pharmaceutical company in the United States) and the Chicago-based merchandiser Sears & Roebuck. Cocaine was also mixed with wine; one brand, Vin Mariani, had as much as 7.2 milligrams of cocaine per ounce (about 30 milliliters) of wine.

Cocaine's most famous application was as an ingredient in Coca-Cola (as the first part of the drink's name indicates). Lack of regulation in the late nineteenth century and the fact that the recipe was a carefully guarded secret make it impossible to determine the exact amount of cocaine used in Coke's production, but amounts likely ranged from 0.5 to 5 ounces (14 to 142 grams) of coca leaves per gallon (3.8 liters) of syrup. This would mean as

much as 1 milligram of cocaine in each glass of soda. In 1904 the company began using only "spent" leaves, from which most of the cocaine had already been extracted. When the 1906 Pure Food and Drug Act required manufacturers to list habit-forming ingredients in their products, Coca-Cola stopped its use of cocaine. Coke does, however, still include a coca extract that contains no cocaine.

Although cocaine's addictive properties soon became clear, its gradual criminalization was due largely to the fact that it became linked with racial and class fears of the era. Sensationalist mass-media reports claimed that cocaine addiction was rife among poor blacks, laborers, and "unsavory" elements in society, who were responsible for rape, murder, and all manner of criminal activity. While the Pure Food and Drug Act simply required cocaine to be a listed ingredient, the Harrison Narcotics Tax Act (December 17, 1914) made it illegal for individuals to distribute and use cocaine. Pharmaceutical companies and doctors could still make and prescribe cocaine for medical purposes, but this would now be regulated and taxed. The ban on cocaine was not strictly enforced until the Controlled Substances Act of 1970.

—Maxine Taylor

the commission analyzed more than 2,500 samples of food and drink for adulterants. *The Lancet* published the findings in frequent reports, which showed that many common goods such as coffee, sugar, flour, tea, bread, and tobacco were adulterated. A Parliamentary Committee of Inquiry was established to investigate the accuracy of the commission's reports, and Wakley and Hassall's work led directly to the passage of the Food Adulteration Act of 1860. Although this first act had little practical impact, it was soon replaced by the Food Adulteration Act of 1872, the Sale of Food and Drugs Act of 1875, and the Food Adulteration Act of 1899. Under the guidelines of the 1872 act, the Society of Public Analysts was created in 1874 (with Hassall serving as its first president) in order to monitor the safety of foods and beverages being sold in Britain.

The United States lagged several decades behind Britain in the movement to prevent food

adulteration. Up until the early 1900s, state governments were responsible for overseeing food safety, resulting in a patchwork of regulations unenforceable across state lines. The Progressive Era's agenda of political and social reform and government regulation of business, however, primed Americans for federal legislation governing food safety. The public had been alerted to the issue of food adulteration by events in Britain as well as by the work of the U.S. Department of Agriculture's Division of Chemistry, directed by Harvey Washington Wiley (1844–1930). From 1887 to 1902, the division published a ten-part series titled *Foods and Food Adulteration*, which examined the issue in great detail. But it was Upton Sinclair's 1906 exposé *The Jungle* that proved to be the most powerful catalyst for change. Sinclair's book, meant to highlight the corrupt and exploitative nature of the Chicago meatpacking

industry, also revealed the horrible condition of the slaughterhouses and the animals killed there. Frightened by accounts of animals riddled with disease, carcasses contaminated with feces, and even workers accidentally falling into grinders, Americans demanded regulation. On June 30, 1906, Congress passed the Meat Inspection Act, which required the USDA to inspect all carcasses and slaughterhouses.

Passed on the same day as the Meat Inspection Act, the Pure Food and Drug Act had a much broader impact. It prohibited the production, sale, or interstate transport of (vaguely defined) adulterated food. The act also prohibited the sale of dangerous patent medicines and required manufacturers to list all habit-forming substances used in their products. To enforce these new measures, the Division of Chemistry—later transformed into the Bureau of Chemistry and then the Food and Drug Administration (FDA)—was given sweeping regulatory powers. The Pure Food and Drug Act later was superseded by the more comprehensive Food, Drug, and Cosmetic Act of 1938.

Taverns and Saloons

In the early eighteenth century the tavern or saloon, as an establishment primarily for drinking and socializing separate from other functions such as lodging, became a feature of urban and rural landscapes throughout the Western world. The rise of the tavern, particularly when

combined with the social and demographic changes attendant to immigration, colonialism, and industrialization, was a source of both anxiety and exuberance, and such establishments would become places—both literally and figuratively—of debate.

William Hogarth's famous prints *Gin Lane* and *Beer Street* (1751) capture both the centrality of drinking establishments to everyday life and the anxieties they provoked: while beer seemed to stimulate congeniality, industry, and health, gin—a relatively new invention at the time—inspired dissipation, sloth, and madness. Meanwhile, many European colonial authorities saw taverns, both in port cities at home and overseas, as sites of social disorder and rebellion, a fear that proved true in some American colonies, where they played central roles as gathering places for revolutionaries.

Debates about saloons and taverns and the social disorder they allegedly created continued throughout the nineteenth century, reflecting broader conflicts along lines of race, class, ethnicity, religion, and gender, and were expressed in movements for temperance (the controlled and moderate use of alcohol, including laws forcing taverns to close on Sundays) and prohibition (the outright banning of alcohol). White middle- and upper-class women in Britain and America, for example, linked temperance drives and other actions to broader campaigns for suffrage and abolition, with the result that prohibition came to be seen as a “women’s” cause, while also focusing on the “overindulgence” of working-class people. In the cities of North America and elsewhere, the growing presence of Catholic immigrants from places like Ireland and Germany, with strong drinking traditions, meant that temperance, nativism, and “anti-Popery” went hand in hand, while on the frontiers of settlement, conflicts between the “saloon crowd” and the forces of “law and order” often shaped discourses and policies regarding the control of aboriginal peoples and others.

Long-standing anxieties about taverns and saloons, along with the rising power of centralized nation-states and movements for social reform such as Progressivism, created the ideal conditions for prohibition in the early twentieth century, particularly in parts of the world

dominated by Protestantism. In the United States, many states began enacting prohibition after 1900. In part due to the efforts of national organizations such as the Anti-Saloon League of America, Congress passed an amendment to the U.S. Constitution in 1917 to make prohibition the law of the land (the Eighteenth Amendment, which was ratified in 1919 and went into effect in 1920). Simultaneously, many Canadian provinces enacted similar laws, while in Britain alcohol consumption was intensively regulated through rationing, taxation, and restrictions on pub hours. In Scandinavia, measures were taken ranging from strict controls on sales and imports to outright prohibition. Most national prohibition schemes were abandoned within a generation, most notably in the United States, where another constitutional amendment in 1933 repealed prohibition, acknowledging that it had failed to do anything but fuel an enormous black market of moonshine and speakeasies. Nonetheless, many local jurisdictions would continue to place restrictions, including complete bans, on taverns and saloons throughout the twentieth century.

The Temperance Movement in the United States

During the nineteenth century, a movement developed to eradicate the negative effects of alcoholic beverages on individuals and society. Known as the temperance movement, its followers' belief in the destructiveness of alcohol found outlet in a loose association of organizations

beginning in the 1820s and culminating in the United States in 1919 with the ratification of the Eighteenth Amendment to the Constitution (Prohibition).

Benjamin Rush (1745-1813), one of the founding fathers of the United States, in 1784 became one of the first significant advocates of temperance in a newspaper editorial titled "An Inquiry into the Effects of Spirituous Liquors on the Human Body and the Mind." He later published the "Inquiry" in book form, eventually selling more than 170,000 copies. The body and spirit were not wholly disconnected, however, and Rush's "Inquiry" included a so-called moral thermometer that gauged the negative effect of spirits on every aspect of the drinker, no matter where in the world he did his drinking.

Temperance organizations in the United States began in Saratoga, New York, in 1808, and then spread through New England. By the 1830s, local chapters of temperance organizations numbered in the thousands. The Ulster Temperance Society, founded in Ireland in 1829, was the first significant European organization to oppose alcohol. In 1832, seven English workers signed a pact against the use of liquor. Their influence spread, and three years later the British Association for the Promotion of Temperance began. On the Continent, temperance organizations gained influence in the Scandinavian countries by the late 1830s.

The scope of temperance organizations evolved over time. At first, their focus was personal, with members pledging not to drink alcohol. In the 1840s, however, groups began refusing alcohol to others. Finally, advocacy of an alcohol-free society and laws to make that society possible became the temperance goal. Advocates wanted social reform, as did many others in the new industrial society. One of the most common early tactics was the temperance pledge. Local and national organizations in the United States and Britain encouraged citizens to sign prefabricated pledges promising to abstain from alcohol. Signing was far easier than abstaining, however, and the pledges were often used as publicity tools for politicians or protective fronts for drinkers.

As the crusade for abstinence from alcohol grew as a result of urbanization and improved

communication, many different groups and individuals took part, some affiliated with organized temperance societies and others on an individual basis. In Britain, artist George Cruikshank authored a series of books on the dangers of alcohol, including *The Bottle* in 1847 and *The Drunkard's Children* in 1848. His illustrations, along with those of the eighteenth-century artist William Hogarth, depicted the bleak life of those who imbibed. Theobald Matthew, a Catholic priest, led thousands in Ireland to the temperance cause. In the United States, the crusading Carry A. Nation often took violent measures in saloons across the country in an effort to persuade Americans of the dangers of liquor. Various religious groups became involved as well. In Europe and the United States, abstinence from alcohol often was portrayed as a measure of Protestant decency, a counter to the Catholic vulgarity of drink. Catholics, however, also were ardent temperance advocates in many parts of Britain and the United States; groups such as the Pennsylvania Catholic Total Abstinence Society preached temperance as a religious duty.

Probably the most notable group of temperance advocates, however, were women—particularly U.S. women. In addition to Carry A. Nation, the prominent feminists Susan B. Anthony and Frances Willard also took stands against alcohol. Though originally a male-dominated endeavor, temperance slowly came under the purview of women. In 1874 in Cleveland, Ohio, the Woman's Christian Temperance Union (WCTU) was founded, followed in 1895 by the Anti-Saloon League. Male drunkenness, which produced the bulk of temperance grievances, was considered a particular problem for females due to their place in society. Men were perceived as the breadwinners, and in a system in which women were dependent on men, women took a special interest in the problem. Additionally, in an age in which women were lauded as paragons of domesticity, temperance offered many a route to the public sphere that otherwise may have been withheld from them.

Perhaps the most significant mass movement of temperance advocacy (other than established organizations such as the WCTU) was the Woman's Crusade. In 1873 and 1874,

U.S. women engaged in nonviolent direct action against liquor distillers, transporters, and retailers through petitions, demonstrations, and prayer vigils. Their success led to state and local legislation as the groups sought aid from the religious community. Many women used the temperance movement as a springboard into the suffrage movement.

The WCTU gained an international membership in the early 1880s, leading to the formation of the World Woman's Christian Temperance Union in 1883. The development of the WCTU into a global entity was indicative of the smaller world created by the better communications of the Industrial Revolution. The Order of the Good Templars, founded in New York in 1851, had an international membership. Later, in 1909, the International Prohibition Confederation began in London. Formed from an international conference on prohibition, the confederation's membership included representatives from Europe, the United States, Canada, Australia, India, and various nations in both Africa and South America. Eliza Daniel Stewart, a leader in the Woman's Crusade of the 1870s, used her success to publicize a speaking tour that took her across the United States and, in 1876, to Britain, where her enthusiasm led to the British Woman's Temperance Association.

The country of Stewart's birth had been actively engaged in the temperance debate for almost a hundred years at the time of her trip to Britain. The American Temperance Society had more than 1 million members before the Civil War. In 1851, Maine prohibited alcohol sales and consumption, making it the first dry state. Though the temperance movement ultimately abated, its legacy remained. As citizens in Europe and the United States adapted to the changing society, cultural apprehension somewhat dissipated, and U.S. prohibition officially was repealed by the Twenty-first Amendment in 1933. Individual dry counties across the United States, however, still retain the legacy of the temperance movement by banning the sale of alcohol. Most of them are located in rural areas, as those in the country attempt to reclaim what those in the burgeoning cities of the Industrial Revolution never could.

Temperance Movement in Great Britain

As elsewhere in Europe, the drinking of alcohol in the form of wine, beer, cider, and various distilled spirits in England has had a long history. Although its excessive use had attracted its share of critics, its use was generally accepted and tolerated as a part of life. From the 1690s through the 1820s the British government even actively promoted gin production as a way to utilize surplus grain and raise revenue. Only in the nineteenth century did temperance become a social cause whose adherents sought to limit the amount of alcohol consumed within the general community, especially among working-class males, or ban its use altogether.

The temperance movement's origins can be traced back to the eighteenth century. English authorities took steps to limit excessive gin drinking among the poor of London and other cities by passing a series of laws between 1729 and 1751 that raised taxes on gin and sought to regulate its sale in the many thousands of cheap gin mills that had sprung up in the early 1700s. In the late 1700s the writings of the Scottish-trained American physician Benjamin Rush drew attention to the health dangers of alcohol

consumption. Read on both sides of the Atlantic, his "Inquiry into the Effects of Ardent Spirits upon the Body and Mind" challenged the traditional view of alcohol as something good for one's health and suggested that alcohol abuse was responsible for epilepsy, dropsy (a buildup of fluid in the body), mental disorders, liver failure, apoplexy (strokes), and many social ills.

In the nineteenth century the temperance movement emerged as one of several reform movements that also included women's suffrage, abolitionism, and improving housing, education, and labor conditions. Like these other reform movements, temperance drew support both from evangelical Christians, who saw alcohol abuse as a threat to salvation, and utilitarian reformers, who saw it as a threat to the general good of society.

The first temperance organizations began to appear in Ireland, Scotland, and northern England in the 1820s and from the beginning were marked by disagreements and tensions. Temperance supporters from the middle and upper classes, who dominated these early organizations, often struggled to view those they helped, usually the poor, as equal. By the 1840s leadership began to shift to the working class, often Baptists and Methodists outside the established Anglican Church. Temperance's definition was also bitterly contested. At first the goal was reasonable alcohol use, but unity was destroyed by those who declared all use sinful, including sacramental wine. In 1832 the tradesman Joseph Livesey, originator of teetotalism (total abstinence), started a teetotal group. As working-class teetotalers gained prominence within the movement, many moderates came to view them as embarrassing fanatics.

Regionalism also furthered disunity, as northern English supporters tended toward more ardent teetotalism than did southerners. Northerners feared control by London, giving rise to two national temperance societies: the British Association for the Prevention of Intemperance, based in the north, and the National Temperance Society, based in the capital. Local temperance societies often split over how explicit antidrink pledges should be, dividing into long-pledge and short-pledge groups. Thomas Swindlehurst, a working-class temperance leader known for his unpolished style, in

WOMEN IN TEMPERANCE

Catherine Booth, who worked with her husband in the 1860s in organizing the Salvation Army, is one of the more prominent examples of women's involvement in the temperance movement. However, women had long before been involved in temperance through women's auxiliaries to local and national men's societies. Their work with children's church societies was vital in transmitting temperance to the next generation. Most importantly, however, women found in temperance, suffrage, and abolition movements opportunities to hone leadership skills, such as organizing meetings, publicity, public speaking, and advocacy journalism. English and American women were instrumental in temperance becoming international. Margaret Parker and Margaret Lucas both became head of the British Women's Temperance Association, founded in the 1870s. Women were, like men, unable to prevent group schism. In 1906 Isobel Somerset, head of the World's Woman's Christian Temperance Union and the British

A strong advocate of temperance and charitable work for the poor, Catherine Booth co-founded the East London Christian Mission with her husband William in 1865. It became the Salvation Army in 1878. (Harold Begbie. The Life of General William Booth, 1920)

Women's Temperance Association, was forced out because she supported governmental regulation rather than prohibition. Eventually women held office in temperance groups formerly dominated by men, but this did not cause women's groups to disband.

—J. Elton Smith

the 1830s and 1840s took temperance's message to the destitute through emotionally ardent appeals and grandstanding events in the streets and in rented halls. These events were designed to draw the attention of the poor to teetotalism as the only escape from the misery caused by drunkenness. Brewers, formerly welcome in temperance as responsible-use advocates, were condemned by teetotalers.

Young people had their own temperance societies, usually auxiliaries of adult ones. Many youths joined Bands of Hope, founded in 1847 by adult temperance workers, or other religious or secular temperance clubs. Anglicans set up special forward-looking programs, meeting prisoners on discharge and helping them understand alcohol's links to criminality. Women were important not only in organizing children's temperance work and assistance for prisoners but also in setting up their own organizations.

The Salvation Army, an English religious organization that became international, was founded in the 1860s by William and Catherine Booth in London's slums. Originally not quasi military, it took that form in the 1870s with officers,

marching bands, and a military style of strict discipline. The Salvation Army won gradual acceptance, as many in England recognized its faithfulness in helping persons devastated by alcohol. Hostility between and within denominations occurred over using sacramental wine and whether teetotalism should be mandatory for members and ministers. Methodism suffered schisms over this question. In 1888 the Church of England officially rejected grape juice at communion, although other denominations required it.

The 1870s saw further parliamentary efforts to control alcohol's use. An 1871 licensing law for stricter regulation of alcohol sales sponsored by cabinet member H. A. Bruce was blocked by alcohol special interests, but in 1872 some licensing reform passed. Controversial among temperance supporters was whether government should enact prohibition or heavily regulate usage through stricter licensing or Sunday closing laws and whether pubs losing licenses deserved compensation. The prohibition strategy was widely unpopular in England. Member of Parliament Wilfrid Lawson, director of the United Kingdom Alliance, helped bring temperance

issues before Parliament. The National Temperance Federation, formed in 1884 and chaired by member of Parliament W. S. Caine, failed in coordinating all temperance organizations.

The Liberal Party's 1895 platform supported local choice whether to adopt prohibition, but antiprohibition sentiment fueled Liberal defeat. However, a 1902 law made it illegal to sell alcohol to minors. Temperance continued to distance itself from mainstream British society as secularism grew in influence. Temperance became more identified with sectarian fanaticism. With World War I the movement declined,

although in America prohibitionist temperance had yet to reach its high point.

■ Introduction: Leisure in the Industrial Era

The Industrial Revolution, with its accompanying development of transportation and communication networks, encouraged urbanization, the concentration of work forces and production, and the commercialization of culture. The developing order lent new possibilities for leisure within and across social classes and within the private and public spheres. Throughout the industrial era, older leisure forms survived and slowly transformed, such as medieval fairs in Europe, while increased literacy offered new audiences for the evolving print culture (newspapers, magazines, novels, and libraries), and sports moved from recreation to professional spectator-based leisure. Another constant: elites' efforts to contain unruly entertainment venues and activities. The spread of department stores and of consumer possibilities also changed general attitudes toward leisure and its value.

In earlier centuries, workers' perceived natural tendency toward "idleness" and dissipation enforced notions that poverty and hunger were useful spurs to production, while idleness should be punished or frowned upon. Yet Enlightenment and romantic thought, as offered, for example, in the pedagogical theory of Jean-Jacques Rousseau (expressed in his novel *Émile*) and in the early-nineteenth-century theory of Friedrich Fröbel (founder of the Kindergarten

movement in Germany), stressed human potential and the value of allowing citizens to better themselves. Laborers, certainly, had no doubt as to the benefits of leisure. Two major objectives of the labor movement in the 1800s across the industrial world were a ten-hour workday in the early nineteenth century and then an eight-hour workday after midcentury. As the chorus of a popular 1878 labor song put it: "Eight hours for work, eight hours for rest, eight hours for what we will."

Throughout the nineteenth century, whether functioning within a Christian moral context (particularly with the temperance movement to limit or ban alcohol) or from the basis of the republican philosophy that an informed and enlightened citizenry could benefit a society as a whole, elites sought to encourage temperate living habits, education, and moral uplift. General education, popularized science, and moral entertainments were seized upon as methods to maintain a virtuous populace. The lyceum movement, which spread from Scotland to France and North America, encouraged laborers ("mechanics") and office workers to attend lectures, borrow books from lending libraries, and, in general, educate themselves. Much of this education focused on the sciences.

In the 1830s and 1840s in cities that were industrial and commercial centers, galleries of

popular science opened to the public. Notable examples were the Adelaide Gallery and the Polytechnic Institution in London, the Royal Victoria Gallery of Practical Science in Manchester, and the longer-established Peale's Museum in Philadelphia. These museums featured dazzling displays of technology, products of industrial arts, electric eels, "oxyhydrogen projecting microscopes," the firing of steam guns, lectures, and much else. Beginning with the Crystal Palace Exposition of 1851 in London, world's fairs became popular destinations that offered educational opportunities, displays of national pride, a narrative of the march of civilization, and surrounding amusement zones. Inside the expositions were gardens, fountains, halls filled with machinery, and national exhibits and products of the industrial and fine arts.

Older public venues, including fairs that had survived for centuries, remained popular, such as St. Bartholomew's Fair in London, where fairgoers at the turn of the nineteenth century could see waxworks, "human freaks," animal exhibits, and exhibitions of glass blowing and clockwork automatons or could enjoy rides. Steamships and rail lines increased the crowd size of some traditional fairs such as the fair at Greenwich, while electric streetcar companies often developed beer gardens, pleasure grounds, or amusements at the end of their routes to increase weekend ridership.

Many reformers in Europe and the United States fretted over the possibly harmful effects of industrial labor and urban life and regarded physically active leisure as a corrective to social ills. The gymnastics movement that began in Germany as the *Turnverein* in the early nineteenth century encouraged good health and fitness as a nationalistic blow to possible physical and moral degeneracy. Friedrich Ludwig Jahn's *Die Deutsche Turnkunst* (1816) influenced educators not only in Germany but also in Switzerland, North America, and elsewhere, propelling the development of the new sport of gymnastics. In the United States, educator Catherine Beecher also promoted the value of exercise in her *Course of Calisthenics for Young Ladies* (1832). Friedrich Fröbel's kindergartens in Germany also emphasized the importance of movement and dance to young students.

As an antidote to stunted urban vistas, proponents of the rural cemetery movement in the United States, beginning with the creation of Mount Auburn in 1831 in Massachusetts, sought to make cemeteries natural refuges for picnics and strolls. Public parks proponents, such as Frederick Law Olmsted, further promoted the values of nature viewing as a preventative against social ills in such arenas as Central Park and Prospect Park in New York City and Delaware Park in Buffalo, New York. The playground movement of the late nineteenth century also stressed the value of exercise and sports to the impoverished. Organized sports generally spread from privileged circles to wider participation by lower classes and also developed into large-scale spectator sports, such as cricket in Britain and boxing and baseball in the United States.

Throughout the nineteenth century, middle- and upper-class women had few opportunities for escape into the larger public realm. In the late nineteenth century, department stores, as an adjunct to parlor culture, provided one new venue for middle-class women to roam, leaving their children in nurseries at the department stores while they took in a concert or art exhibit and viewed the latest fashions. Industrial innovation also dovetailed neatly with the interests of suffragettes and health reformers to fuel the bicycle craze of the 1880s and 1890s throughout Europe and North America. Mass-produced bicycles allowed new freedom of movement as did clothing reform, as women who decried the harmful effects of the wearing of tight corsets took to wearing "bloomers" in public on their rides. While some reformers seized on the healthfulness of the bicycle craze, preachers denounced Sunday cyclists who took to the roads instead of attending services.

Reading material also was mass-produced and retailed to different social classes. Ladies' magazines taught the niceties of parlor culture and emphasized the importance of a woman's role in the home and the value of a well-stocked household and parlor, adding taste distinctions to shopping. Dime novels as well as magazines that published stories and serial chapters gained enormous circulations in North America and Europe. U.S. dime-novel publishers such

as Street and Smith assigned plot sketches and characters to their stable of authors, the more adept of whom could write two 40,000-word novels a week; the resulting books were then distributed to newsstands in first runs of about 50,000 copies.

By the end of the nineteenth century and in the early twentieth century, the burgeoning commercial culture was giving way to what historians call mass culture, in which standardized products could be sold to enormous anonymous segments of the public. Prime examples include mass-circulation newspapers, sheet music for popular songs, Edison wax cylinders for phonographs, and the developing music halls and vaudeville theater circuits throughout the industrial world that offered urban audiences smoothly programmed and standardized nights of entertainment.

Spectacles—that is, mass theatrical productions in which audiences were dazzled by the sheer scale of productions and backstage logistics—also emerged. These included Wild West shows, circuses, and renderings of historical spectacles such as the destruction of Pompeii. Electrification and displays of lit buildings at world's fairs and on city skylines as well as the flashing and streaming electrical displays of the “Great White Way” in New York added new possibilities. On the occasion of the opening of the Paris world exposition of 1889, one observer remarked that the entire city of Paris had become a “permanent exposition.” As this culture of the spectacle emerged, staged dramas and exhibitions slowly gave way to electrical media, whether in the kinoscope parlors of the late 1890s or the storefront movie theaters (or “nickelodeons”) that emerged in the 1900s and slowly became an acceptable middle-class venue.

Board Games and Puzzles in Europe and the United States

Over the past 150 years, games have served multiple purposes. Prior to the nineteenth century, board games were mainly played by adults. In the 1800s, however, family-focused board games developed and gained popularity as many Europeans and Americans enjoyed increased literacy and leisure time. Board games and puzzles provided children and families with opportunities for fun, entertainment, and learning. Game playing allowed for time spent with family and friends and promoted the values and ideals of society. The board games and puzzles that developed throughout the nineteenth century were more easily manufactured and mass-produced and became more affordable and available to the middle classes.

For most of the nineteenth century, leisure time increased for middle-class families as much of Europe and the United States became increasingly urban. The home became the center for entertainment and learning. Many store-bought games emphasized literacy and typically involved a board on which game pieces or counters were moved across, on, and off using dice, cards, or spinners. By the 1870s games were more easily manufactured, and many middle-class families were able to purchase mass-produced board games and jigsaw puzzles. Early board games were intended to teach moral values and reinforce gender roles. *Mansion of Happiness*, invented by the W. & S.B. Ives Company in 1843 and the first board game sold in the United States, re-created real-life situations, depicted vices and virtues, and rewarded the good deeds and punished the bad.

In the latter half of the nineteenth century and in the early twentieth century, board games also focused on themes of capitalism and materialism. In *The Checkered Game of Life*, created by Milton Bradley in 1860, players move through

➤ JIGSAW PUZZLES

When European mapmakers pasted maps onto pieces of wood and cut them into small pieces in the 1760s, they likely did not realize that they were inventing one of the most popular toys ever. London mapmaker John Spilsbury was the first to commercialize jigsaw puzzles in the 1760s.

Jigsaw puzzles are games in which a picture is assembled of interlocking pieces. The object is to put the pieces of the puzzle back together, reforming the picture. The name was given because the puzzles were made by painting pictures on wood and then cutting randomly shaped pieces with a jigsaw cutting tool. The first jigsaw puzzles were maps intended to teach children geography and were soon popular in Britain (1760s), France and the Netherlands (1770s), and Germany and Austria (1820s). Map puzzles appeared in North America in the 1850s.

By 1900 jigsaw puzzles were created and sold for both children and adults, and by 1908 the puzzles were a massive craze in the United States. Jigsaw puzzles were expensive due to the labor involved in making them. In 1908, for example, a 500-piece puzzle typically cost \$5. Parker Brothers, the popular game maker, began selling puzzles in 1887. The puzzles were so popular that the company devoted an entire factory to their production in 1909.

—Kim Kennedy White

mundane stages of life such as marrying, getting a job, having a family, and making money. Milton Bradley's *The Game of the District Messenger Boy* (1886) taught that hard work and good deeds can allow anyone to succeed.

As more west Europeans and Americans traveled during the late nineteenth century, travel games such as *Around the World* (1873) and *The McLoughlin Brothers' Game of Round the World* (1890) gained popularity. In addition, new games were created through the adaptation of older games. The ancient games of Snakes and Ladders and Ludo from India were repackaged and introduced to English families in the latter part of the nineteenth century and are more commonly known as Chutes and Ladders. The game of Halma, which was invented by an American surgeon in 1883, was inspired

by Hoppity, an English game from 1854, and later became Stern-Halma in 1893 in Germany, better known as Chinese Checkers. The present-day game of Othello also got its start in the late nineteenth century, with two English inventors claiming to be the creators; Lewis Waterman claimed to have created the game of Reversi in 1888, but John W. Mollet claimed that Othello was based on his game of Annexation that he invented in 1870.

The mid-nineteenth century saw the beginnings of game-manufacturing companies as the industry took off in popularity and sales. The Milton Bradley Company opened its doors in 1860 in Springfield, Massachusetts. Its founder, Milton Bradley (1836–1911), is credited with pioneering the game board industry. The Parker Brothers also got their start in the nineteenth century. As a teenager, George Parker (1866–1952) invented and successfully sold a game called Banking in 1883 and joined his brother Charles in establishing Parker Brothers in 1888 in Salem, Massachusetts. Their initial inventory featured 29 games, most of which were invented by George Parker.

By 1900 more than 500 game companies were in business, with an annual market of \$20 million. Game manufacturing continued to explode with the creation of other types of games and puzzles, such as the crossword puzzle, invented by Arthur Wynne in 1913, and the jigsaw puzzle craze of the early twentieth century.

Music Halls in Britain and France

The rise of the music hall during the late Victorian and Edwardian periods in Britain and during the Belle Époque (Beautiful Era) period in France provided the masses with various entertainments. Music halls, similar to vaudeville in the United States, combined elements of saloons, pubs, and theaters and showcased a variety of acts that included everything from opera, folk songs, and popular dance to ballet, comedy, and sing-a-long musical sketches.

Music halls differed from theater in that patrons could sit at tables and drink alcohol and smoke during the show. Famous performers of the time appeared on music hall stages such as Marie Lloyd (1870–1922), one of the best-known singers and comediennes, who began her career in music halls as a teenager. At the turn of the century, music halls also provided adult entertainment and even more exotic and outrageous acts. The British music halls appealed to a mass audience and, in particular, the lower classes, while in France the music halls were open to all social classes but were particularly popular with the aristocracy.

Charles Morton opened the first music hall, the Canterbury, in 1852 in the Waterloo area of London. A competing music hall, the Weston, opened in 1857 in the West End of London where, during the 1850s and 1860s, other music halls began opening and quickly gained popularity. Popular music halls in the West End included the Alhambra (1860), the Oxford Music Hall (1861), and the London Pavilion (1861). At the end of the nineteenth century, music halls had gained popularity in the suburban areas of England and had spread to Scotland and Ireland.

On January 22, 1907, the “Music Hall War” broke out in London because of labor disputes among music hall performers, stage hands, and managers, causing a two-week strike. Many of the music hall “stars” were unaffected financially by the strike but came out in support of those employees in less lucrative positions. Most of the employees’ demands were accepted in arbitration, such as a minimum wage and maximum working hours.

Music halls also gained enormous popularity during the Belle Époque in France, a golden age of peace and prosperity in which arts,

THE FATHER OF THE HALLS

Charles Morton was born in East London in 1819 and is known as the “Father of the Halls.” Inspired by the early music and supper rooms, he built and managed the first of the great music halls, the Canterbury Music Hall, in 1852. The 1,500-seat hall showcased music, comedy, and other variety acts. Morton, a savvy businessman, coined the term “music halls” and popularized them through aggressive marketing and advertising in *The Times*. He increased hours and admitted women in order to gain wider appeal, and in 1861 he opened his second theater, the Oxford, in competition with another great music hall of London, the Weston Music Hall. Morton was responsible for successfully reviving and managing several music halls and theaters before his death in 1904.

—Kim Kennedy White

entertainment, and leisure flourished. The first music hall, the Fantasies Oller, was opened by Joseph Oller in Paris in 1875. The three best-known music halls of the period were the Moulin Rouge, the Casino de Paris, and the Folies Bergère. The Moulin Rouge opened its doors in 1889, and while it was known for the cancan dancers, the hall provided entertainment in the form of lavish productions and prominent singers, dancers, and comedians.

Popular music hall songs during World War I were patriotic and reflected the war effort. Music hall audiences sang songs such as “Keep the Home Fires Burning” (1914), “Pack Up Your Troubles” (1915), and “It’s a Long Way to Tipperary” (1914). In 1914 music halls began to decline as other forms of entertainment gained popularity, and licensing restrictions required a separate bar, as drinking was banished from the auditorium. Today few historic music halls remain, as many were claimed by fire and bombing during the world wars or were demolished, to be replaced by new buildings and businesses.

World's Fairs

World's fairs, also called international exhibitions or international expositions, became popular venues in the mid to late nineteenth and early twentieth centuries. The fairs were opportunities for nations to celebrate the achievements of the Industrial Revolution as well as to commemorate historic events. Although the holding of commercial fairs, often in conjunction with holidays, dates back to medieval times in Europe, the world's fairs of the nineteenth century and later were of a size and scale unknown until that time. Furthermore, they were truly international, as represented in their exhibits, exhibitors, and amusements.

The first major world's fair was the Great Exhibition of the Works of Industry of All Nations, held in Hyde Park in London in 1851. Commonly called the Crystal Palace after the popular designation given to its famous iron and glass hall, the exhibition drew 6 million visitors. A series of subsequent exhibitions was held in Dublin, Ireland (1853); New York City (1853–1854); Paris (1855); London (1862); and Dublin (1865). The 1867 Exposition Universelle, on the Champ de Mars in Paris, instituted a number of features that thereafter became elements of many world's fairs. These included national pavilions, ethnic restaurants, an amusement area, and special gardens and waterways. The Paris exposition had over 100 national pavilions financed by individual nations themselves, ranging from Swiss chalets to English lighthouses to Islamic mosques. There was a working model of the Suez Canal, boat rides along the Seine River, and sightseeing trips aboard a double-decker balloon.

Vienna held a major exhibition, the Weltausstellung, in 1873 along the Danube River. Its

main building was over a half mile (0.8 kilometers) in length, crossed by 16 transepts and surmounted by a huge cast-iron dome 320 feet (97.5 meters) across and 270 feet (82 meters) high, affording visitors a view of the grounds and the city. Crowds, however, proved disappointing, totaling 5 million people. Santiago, Chile, hosted the Exposición Internacional in 1875, and Cape Town, South Africa, held the South African International Exhibition in 1877, but these were eclipsed by the 1876 Centennial Exhibition in Philadelphia, celebrating the 100th anniversary of the birth of the United States. The Philadelphia exposition, occupying 236 acres (95.5 hectares) in Fairmount Park, featured national pavilions (such as a British half-timbered building), ethnic restaurants, and exhibits of new inventions including the Westinghouse air brake and Edison's telephone. Other major exhibitions followed: Paris (1878), Sydney (1879–1880), Melbourne (1880–1881, 1888–1889), Amsterdam (1883), Calcutta (1883–1884), New Orleans (1884–1885), London (1886), Glasgow (1888), Brussels (1888 and 1897), Barcelona (1888), and Antwerp (1885 and 1894).

The 1889 Exposition Universelle in Paris, celebrating the centennial of the French Revolution, was made famous by the Eiffel Tower. Over 32 million visitors attended the Paris fair, held at the Champ de Mars as well as along the south bank of the Seine. The massive Palais des Machines was an engineering marvel, constructed of steel and glass with a 375-foot (114-meter)-wide central aisle. The 1893 Columbian Exposition in Chicago, held one year late but celebrating the 400th anniversary of Columbus's voyage to the New World, attracted over 27 million visitors. Carved out of swampy land in Jackson Park along Lake Michigan, the site of the fair was designed by noted landscape architect Frederick Law Olmsted. The gleaming Beaux Arts buildings of this "White City" featured electric lights that dazzled evening visitors, as did special exhibits by Westinghouse and General Electric. An electric railway and a movable sidewalk shuffled visitors throughout the site. The contiguous Midway Plaisance featured sideshows and exhibits including the belly dancing of Fahreda Mahzar, known to the world as "Little Egypt," and 3,000 nationals residing in the Midway's

ethnic villages. The largest of these villages was the German one, which occupied 17,000 square feet (1,580 square meters) and was shipped to Chicago from Germany in 65,000 pieces. It featured a sixteenth-century town, complete with a moated castle, a church, houses, an inn, and a town hall. Of special interest was the mammoth Ferris-wheel, 250 feet (76.2 meters) in diameter and carrying 1,440 people. At Chicago and other fairs, there were also scholarly ethnological exhibits by anthropologists; however, these were often overshadowed by the amusement sections.

In 1900 Paris hosted the Exposition Universelle, with its Art Nouveau emphasis. Five thousand multicolored incandescent lights as well as a Spirit of Electricity driving a chariot with multicolored flames illuminated the night sky. In addition, an annex at Vincennes hosted the first Olympic Games outside of Greece. The Paris exposition set a new attendance record of over 48 million people. The 1901 Pan-American Exposition in Buffalo, New York, featured more than 200,000 electric lights to illuminate its buildings; however, the assassination of U.S. president William McKinley on its grounds cast a gloom from which it could not escape.

The 1904 Louisiana Purchase Exposition in St. Louis, Missouri, held one year after the centennial of the Louisiana Purchase, was mammoth, occupying 1,272 acres (515 hectares), 15 major exhibit halls, and a total of 1,576 buildings. The fairgrounds were so large that visitors traversed them on 13 miles (21 kilometers) of railways as well as by boat. An amusement section known as the "Pike" was home to ethnic villages and twice-daily Boer War reenactments. The St. Louis fair also featured demonstrations of wireless communications; 160 steam, electric, and gasoline automobiles; and an airfield with five dirigibles. Three Belgian exhibitions followed at Liège (1905), Brussels (1910), and Ghent (1913). Italy hosted fairs at Milan (1906) and Turin (1911), the United States hosted fairs at Jamestown (1907) and Seattle (1909), Ireland hosted a fair at Dublin (1907), and New Zealand hosted a fair at Christchurch (1906–1907).

In 1912, 15 nations signed an agreement at Berlin to establish rules for the holding of international exhibitions, but its terms never reached fruition before the outbreak of World War I.

Except for the Panama-Pacific Exposition of 1915 in San Francisco, the era of world's fairs was interrupted, not to be resumed again until the British Empire Exhibition of 1924–1925.

Circus

For centuries, performances such as juggling, horseback riding, and tight-wire walking flourished at Saint's Days and other festivals in Europe, but the modern circus did not emerge until the late eighteenth century in London. The revived art soon spread worldwide. Circus impresarios in England and the United States of the nineteenth and early twentieth centuries made much of their connection to the late Roman Empire, when circuses had last flourished in the Western world. These modern circuses mirrored new dreams of empire as they took up motifs such as chariot races and displays of Roman axe juggling in their shows and promotions.

The modern circus began in 1760 when Philip Astley, an expert horse rider and handler, opened a riding school at Ha'Penny Hatch in London, where he, his wife, his son, and other performers amused audiences with horseback riding feats in its center ring. To advertise, Astley and his family rode on horseback through the streets accompanied by trumpet players and a clown, who passed out handbills through the window of a carriage. Astley's show grew progressively more grandiose, incorporating acrobatics, aerial artists, tightrope walkers, theater, and a full orchestra. By 1772 Astley's troupe

This 1896 poster for the Adam Forepaugh & Sells Brothers circus parodied the burgeoning women's rights movement of the era, encouraging spectators to come and see its female performers—including a female ringleader—in leading roles, and as prototypes of “the new woman in a novel sphere.” (Library of Congress)

began to perform in France and opened an amphitheater in France as well as in London.

At the turn of the nineteenth century Lewis B. Lent performed at the New York Theatre during the winter and in warmer months toured with his troupe via steamboat on the Ohio and Mississippi rivers. By the early nineteenth century many competing traveling circuses, relying on wagons and tent shows, were touring in Europe and the United States.

The railroad helped to turn the circus into even grander enterprises in the late nineteenth century. Already renowned for his many ballyhooed enterprises, including his American Museum in New York City that had succumbed to fire, in 1872 showman P. T. Barnum joined two partners to create the circus Barnum, Coup and Costello. They bought and built their own train cars, and their circus, larger than that of any rival wagon shows, also incorporated Barnum's human oddities and was an immediate financial success.

While Barnum, Coup, and Costello experimented with a two-ring circus, its later merger with the circus of James Bailey led to the creation of the three-ring circus in 1881, a distinctly American spectacle. Barnum and other

producers began to experiment with narratives to give shape to these spectacles. In 1887 Barnum adapted the staged spectacle “Nero, or the Destruction of Rome,” for his circus, offering a story line featuring Roman decadence, chariot races, and reenactments of Christian martyrs being thrown to wild beasts.

The 1880s also saw the development of Buffalo Bill Cody's Wild West Show, a circus variant that more directly fed the mythology of the new American empire. These shows, which glorified the taming of the Wild West, often employed dozens of trick riders, trick shooters, and Native American performers, offering reenactments of buffalo hunts, stagecoach robberies, and battles.

The circus is clearly a resilient art form, adaptable to many lands and governing ideologies. The age of P. T. Barnum and Buffalo Bill also saw the founding of the Moscow Circus. This popular institution, founded in 1888 and housed in lavish headquarters, survived the transition from tsarist Russia into the Soviet era, when the Soviet Union's revolutionary leaders recognized the populist value of the circus and provided state-sponsored circus training schools. With state backing, in the Soviet Union the circus maintained a prestige that had faltered until recent decades in much of the rest of the world.

Amusement Parks

At the turn of the twentieth century, modern amusement parks such as Coney Island's Steeplechase, Luna Park, and Dreamland developed as day-trip holiday spots for urban dwellers. Earlier

spas and pleasure gardens in Europe and the Americas had offered outdoor amusements such as concerts, dancing, firework displays, and rides. The new amusement parks as pioneered at Coney Island featured extravagant architecture, adaptations of new technology, and an engineered approach to the creation of thrills and crowd management. Promoters sought to make the new amusement parks safe places for working-class and middle-class visitors of both genders. Historians have argued that along with other contemporaneous innovations such as the department store, tabloid newspapers, and transit systems, amusement parks helped incubate twentieth-century mass culture.

Amusement parks and world's fairs have always been closely linked. After the Philadelphia Centennial Exposition of 1876, one promoter brought its iron observation tower to the Coney Island beachfront. In 1904 George Tilyou built a large Ferris wheel as an early attraction at what became Steeplechase Park, a decade after the debut of the first Ferris wheel at the World Columbian Exposition in Chicago. Tilyou was also the first promoter at Coney Island to successfully build an enclosed amusement park and charge admission, relying on fantastic architecture and novel rides to attract crowds. His premier early attraction was the Steeplechase ride, which took riders on mechanical horses down a series of hills. More elaborate roller coasters followed, while steamship and train lines also brought crowds to the hotels, restaurants, beer gardens, and area attractions.

Fanciful architecture that was meant to both inspire awe and create thrills was highlighted in the new parks such as Luna Park and Dreamland. The new amusement parks often combined the grandeur of the world's exposition fair grounds with the bawdy pleasures of the world's fair carnival midways. If the electric-lit beaux arts architecture, canals, and fountains of the 1893 Columbian World's Exposition in Chicago inspired masses of fairgoers, the fanciful Orientalist architecture developed at Luna Park and Dreamland elicited both reverie and angry critiques.

Many artists took inspiration from the wild architecture, innovations, and liberalized social codes exhibited at the amusement parks and on

➤ CONEY ISLAND AT NIGHT

Luna Park, which opened in 1903 at Coney Island, featured extravagant architecture. Its swollen minarets, gargoyles, and electric lights created a surreal landscape that delighted turn-of-the-century customers. The architectural style encouraged working- and middle-class customers to find release from their regimented workplaces and the stricter social codes that had been associated with the Victorian era. In the early twentieth century, numerous replicas of Luna Park opened across the United States and worldwide.

(Library of Congress)

the beachfront, a venue that allowed more daring dress and more frank sexual behavior. Some intellectuals, however, were appalled at the manipulated environment. Maxim Gorky, the Russian novelist and social reformer, first praised

the strange vistas of Coney Island when viewed at night from a distance but concluded after his 1906 visit that the amusement park was a “slimy marsh of boredom” pandering to low tastes. Viewing Coney Island as the epitome of the new commercial regime, he concluded of its electric-lit expanses that “the cold gleam of the dead fire bares the stupidity of it all.” The Chicago-based social reformer Jane Addams also argued that the mechanized fun at amusement parks could only dehumanize customers. Both Gorky and Addams were discontented witnesses to the triumph of mass culture and the emerging values of consumer society.

Simultaneous with the rise of Coney Island, amusement parks became a common feature in numerous cities throughout the United States and Europe. Many of these were older pleasure gardens adapted to the American model, including Tivoli Gardens in Copenhagen, Blackpool Pleasure Beach in England, and the Wurstelprater in Vienna. Often the parks were situated at the end of electric trolley lines and were designed to encourage ridership on weekends.

Shortly after their emergence in the West, along with mass transit and department stores, the amusement park spread to other modernizing nations such as Japan. As in the United States, the Japanese amusement centers were placed on new train lines to encourage ridership. The earliest was Takarazuka Family Land, which opened in 1911 outside of Osaka and mixed a hot springs resort with entertainment. In 1912 another amusement park, Shinsekai (New World), which included a replica of Coney Island’s Luna Park, opened at a former exposition grounds in Osaka. Many more amusement parks opened on train lines in Japan in the 1920s.

Cycling

First in Europe and then in the United States a fascination with technology and the sentiment that leisure was a feature of modern life combined to produce the bicycle. The bicycle found a market of consumers among both the middle and working classes and thus brought leisure to a wide public.

Theories abound about the bicycle’s true inventor. Some trace its origins to a student of Leonardo da Vinci or to the French nobleman the Comte de Sivrac, who in 1791 supposedly was seen riding around Paris on a *célérifère*, a two-wheeled wooden frame with no steering that was propelled by pounding the feet on the ground. Others give credit to a German, Karl von Drais, who in 1818 patented his *Laufmaschine* (Running Machine) that resembled the mythical *célérifère* but had steering. For the next several decades tinkers and inventors experimented with pedal-driven tricycles and quadricycles, but none were commercially successful. A major breakthrough occurred in 1863 when French machinists Pierre Michaux and Pierre Lallement each claimed credit for adding pedals to the front wheel; by the 1880s manufacturers in Europe and the United States were churning out the Safety, a bicycle with two wheels of the same size, an iron diamond-shaped frame, rubber tires, a chain to propel the rear wheel, and coaster brakes. Mass production lowered the cost of the bicycle in the United States from \$400 in the 1880s to \$20 in 1898. Europeans enjoyed a similar reduction in price.

As an inexpensive means of transit, the bicycle democratized leisure in Europe and the United States. Men took rides through the countryside on Sunday, often their only day off during the week, and women, despite the uneasiness of some men, took up cycling to challenge Victorian notions of what constituted leisure for women. Corsets and ankle-length skirts would not do; women instead bared their legs in short skirts and bloomers. The straddling of a bicycle struck some men as too provocative a position for women. No less threatening were young women who took up cycling to court men beyond the watchful eye of parents. This use of

THE BICYCLE CORPS

By the 1890s, the bicycle had already revolutionized leisure activity throughout Europe and North America. Reasonably priced, dependable and capable of traveling large distances with ease, the bicycle soon caught the attention of the U.S. Army, which saw a potential martial use in the relatively new invention. The 25th Infantry Regiment of Missoula, Montana, an African American regiment, was assigned to test the viability of a bicycle infantry corps. From their home base at Fort Missoula, 20 African American infantrymen and 2 white officers mounted their bicycles for a series of grueling long-distance rides. The 25th's most notable rides included an 800-mile (1,287-kilometer) round-trip trek to Fort Yellowstone in 1896 and a 1,900-mile (3,058-kilometer) trip to St. Louis,

Missouri, in 1897. Although the men faced harsh weather and rough terrain, pedaling with 55 pounds (25 kilograms) of gear and a 10-pound (4.5-kilogram) rifle, they still managed to travel at twice the speed and half the cost of a normal infantry unit. Plans for an even longer ride to San Francisco were permanently postponed when the 25th was called to Cuba, without their bicycles, to fight in the war against Spain. After the war, advances with the automobile soon made the bicycle obsolete for military purposes.

cycling as a means of courtship prefigured the enthusiasm that couples would take in parking with the automobile.

If cycling afforded leisure for both men and women, it also extended leisure over space. Travel on foot or by horse no longer limited how far men and women could go in pursuit of leisure. Men undertook a Century, a ride of 100 miles (161 kilometers) in a single day, and, along with women, used the bicycle for camping or vacations. Groups of men and women rode their bicycles to a pristine spot for a picnic, visited friends in a nearby town, or took in a baseball game. Cycling afforded sightseeing on a scale that could scarcely have been imagined in the era of the horse as Americans and Europeans used the bicycle to explore a picturesque sight or historic monument. Bicycle clubs in Europe and the United States organized rides for novice and experienced cyclist.

In the short term the bicycle amplified reformers' calls for good roads as indispensable for both travel and leisure. The bicycle also imparted a mobility to men and women that anticipated the mobility of the car. By the early twentieth century the bicycle's influence began to wane with the adoption of the automobile, which, especially in the United States, replaced the bicycle in sightseeing. Families took to the road by car rather

Men ride high-wheelers on the plaza near Trinity Church in Boston, about 1900. (Library of Congress)

than bicycle as the Sunday drive replaced the Sunday outing by bicycle. As the automobile spread, the bicycle became a plaything of children rather than adults. In Asia, Africa, and Europe, however, adults continued to use the bicycle, although often for transportation rather than leisure.

Golf

In the century and a half before World War I, golf evolved from a local unorganized and sometimes illegal pastime to a worldwide highly organized competitive sport. Versions of the game originated in Holland and Scotland in the thirteenth and fourteenth centuries, with the Scottish variety of hitting the ball into a hole in the ground rather than against a pole or tree becoming the most popular.

In the mid-eighteenth century, golfers brought order to the game by establishing exclusive clubs, publishing rules, and standardizing

courses. In 1744 golfers at the Leith Links established the Honourable Company of Edinburgh, the first known golf club, and held a tournament for which the city of Edinburgh purchased a silver cup to be awarded to the champion. Originally open to all golfers, the Honourable Company of Edinburgh restricted the tournament to members only in 1764. Formed in 1754, the Golfers at St. Andrews (later known as the Royal and Ancient) held a tournament and awarded a silver cup to the winner. For this tournament St. Andrews drafted and published 13 rules, the earliest known rules of the game. In 1773 St. Andrews restricted play on the course to club members and those of the Honourable Company of Edinburgh. Originally designed as a 22-hole course, St. Andrews reduced the number of holes to 18 in 1764. As other courses followed the St. Andrews model, 18-holes became the standard length for golf courses. The proliferation of golf clubs continued throughout the eighteenth century, including London's Blackheath in 1767, the first outside of Scotland.

The nineteenth century brought further developments to golf, especially in equipment. Since the early seventeenth century, golfers had used clubs fashioned from branches of thorn trees and a leather-covered ball stuffed with feathers. In 1826 hickory imported from North America began to replace thorn tree branches as the material for golf club shafts. The most notable innovation, however, came in 1848, when a Scottish clergyman, Dr. Robert Peterson, fashioned a ball from gutta-percha, a rubbery derivative of Malayan trees. Obtaining the material from the packing in shipments from India, he softened it in hot water, molded it into the shape of a ball, and allowed it to harden. Far more durable than the previous feather-stuffed leather-covered ball, the new "guttie," as it commonly became known, kept its shape, resisted water, and flew more accurately. Using nails to make small indentions in the surface of the ball, golfers improved ground contact as well as the aerodynamics of the ball.

After patenting his invention in 1850, Peterson contracted with manufacturers in London and Edinburgh, who mass-produced the popular ball. In 1898 Coburn Haskell, a dentist in Cleveland, Ohio, introduced a ball with a rubber core

► HARRY VARDON—GOLF'S FIRST INTERNATIONAL SUPERSTAR

In 1900 Harry Vardon became golf's first international superstar when he toured the United States, playing in more than 80 tournaments and winning the U.S. Open. Born in Grouville, Jersey, Channel Islands, on May 9, 1870, he began playing golf in his teens, became a professional at age 20, and won the first of a record six British Open titles in 1896. Runner-up in the 1913 U.S. Open, Vardon lost to amateur Francis Ouimet, the first native-born American to win the tournament. Vardon made his last U.S. Open appearance in 1920 at age 50. Developing a grip that bears his name, Vardon won 62 tournaments in all before health problems stemming from a bout with tuberculosis curtailed his career. A noted golf course architect who designed several British links, he coached the sport and wrote instructional manuals and inspirational books before his death in Totteridge, England, on March 20, 1937.

—Adam Hornbuckle

wrapped with elastic threads and covered with gutta-percha that proved to be even more lively than balls made of gutta-percha only. In 1905 William Taylor, a British lens maker, developed the current dimpled surface after experimenting with various designs. Innovations in the golf club followed the development of the guttie, as the harder ball required a more durable device. Improvising at first by wrapping leather straps around the end of the club, golfers soon turned to ironsmiths to attach an iron bar to the end of the club, thus coining the term “iron” for the club.

Throughout the nineteenth and early twentieth centuries, golf became increasingly international and competitive. Golf followed the expansion of the British Empire, with courses established in India, Australia, New Zealand, and Canada. In 1888 John Reid, a Scottish immigrant, established the first permanent golf club in the United States, St. Andrews, near Yonkers, New York. Although looked upon as an upper-class pursuit, golf proliferated throughout the United States, with over 900 clubs by the turn of the century. Originating in 1860, the British Open became the first major international championship tournament, followed by the U.S. Open in 1895. British golfers dominated the U.S. Open until Francis Ouimet, a native-born American of French Canadian descent, won the tournament in 1913.

Tennis

Lawn tennis owes its existence to Walter Clopton Wingfield (1833–1912), who invented it in the spring of 1874. For patent reasons, Wingfield named his invention “Sphairistike or Lawn

Tennis” in order to distinguish it from the game of real or court tennis, an indoor sport which was on the decline in England at the time. Like court tennis, lawn tennis took over the principle of striking a ball over a net, of only allowing strokes on the volley or after the first bounce of the ball, and the curious scoring system by fifteens. Unlike real tennis, however, lawn tennis introduced standardized courts as early as 1877; in 1878, the height of the net was set at 4 feet 9 inches (1.45 meters) at the posts and 3 feet (0.9 meters) in the middle, and the distance of the service line was set at 21 feet (6.4 meters) from the net. The tennis ball was also standardized with the acceptance of the white flannel-covered rubber tennis ball developed by J. M. Heathcote in 1874.

Lawn tennis was also able to dispense with the expensive roofed facilities needed by the older game. The invention of the lawn mower had made it possible to trim sufficiently the lawns of the English manor, which led to the creation of smooth playing surfaces. The discovery of vulcanization by Charles Goodyear resulted in the production of rubber balls filled with air, which bounced sufficiently high, even on grass. This made the hard surface of the real tennis court superfluous. As early as the nineteenth century, lawn tennis began to be played on other surfaces as well—on the asphalt of disused roller-skating rinks, on wood, and on clay (an invention of the Germans). The clay court was, albeit reluctantly, introduced in England after the turn of the century.

Originally, lawn tennis was intended as a five o'clock tea pastime for the well-to-do and the landed gentry. In addition, it offered the Victorian matron an opportunity to engineer the marriage of a daughter with a promising young man from the neighborhood. As a consequence, it was scoffed at by the real athletes of the time, university students who derisively referred to it as pat-ball and considered it a girls' game. However, after the first All England Championships of Wimbledon in 1877, for which a committee had laid down the rules, lawn tennis gradually began to be regarded, alongside cricket, as a serious elite sport. From cricket, too, lawn tennis adopted its sportswear—white linen shirts and flannels and, not infrequently, cricket caps. For

a long time, women continued to wear their everyday dresses, tightly laced corsets, petticoats and long skirts, with heeled shoes and broad-brimmed hats into the bargain. Until the turn of the century, this latter item prevented most of them from delivering an overhead service. Only the example of the young American, May Sutton, at the Championships of 1905, and the appearance at Wimbledon of Suzanne Lenglen (known as the “Divine”) after the First World War, eventually persuaded female tennis players to wear short skirts.

Cricket

Cricket is an English bat-and-ball game that has remained popular mainly in England and countries of the former British Empire. The written rules of the game were formulated in the eighteenth century, providing a landmark in the evolution of modern sport. Cricket became a game between two sides of 11 players who took turns batting. An inning was completed when 10 of the 11 players had been dismissed. The chief means of dismissal were caught, bowled, stumped, run out, and leg before wicket (when the ball hits the batsman's body when it would have otherwise hit his wicket). Play occurs at the center of an oval on a wicket consisting of three stumps at each end of a 22-yard (20-meter) prepared grass pitch. An over consists of a set of six balls bowled from one end to 1 batsman. This is followed by an over from the other end by another bowler to the batsman at the other

end. A batsman can hit the ball (on the full or on the bounce) to any part of the field, and a run or runs are scored when both batsmen safely reach the other end. If the ball reaches the boundary, four runs are scored; if the ball is hit over the boundary, six runs result. Batsmen do not have to run when they hit the ball.

Underarm bowling was the norm initially, but the laws were altered in the nineteenth century to allow roundarm and then overarm bowling, though the rules dictated that the ball should be bowled with a straight arm and not thrown.

The origins of cricket are obscure, although it seems clear that the game was played in rural areas in the south of England as early as the sixteenth century. It is estimated that by the eighteenth century 1,000 village clubs were playing some form of the game. Cricket was transformed in the eighteenth century when it generated interest and participation among aristocrats and wealthy landowners because it was a complex and leisurely game amenable to subtle distinctions of class, a focus for gambling, and a place to resolve personal rivalries. Aristocrats added to the status of the game not only by playing it themselves but also by helping formulate the rules and establish its core institutions. Some gentlemen of London were instrumental in the formation in 1787 of cricket's powerful governing authority (until recent decades), the Marylebone Cricket Club (MCC), which was and is based at cricket's most famous ground, Lord's.

By the nineteenth century cricket was considered by educators as a manly and moral game and was introduced at the leading public schools, such as Eton and Harrow as well as Oxford and Cambridge universities. Cricket teams, based on counties, emerged by the mid-nineteenth century. While women had been prominent in village cricket, those women who formed clubs in cities in the late nineteenth century were regarded with suspicion as trespassers on male territory.

Working-class professionals helped transform cricket into a profitable mass spectator sport when they organized squads that toured England in midcentury and then overseas (Canada and the United States in 1859, Australia in 1862, and Australia and New Zealand in 1864).

▶ PLAYING FOR THE ASHES

With their suggestive and even spiritual symbolism that cricket is a matter of life and death, the Ashes have become a potent and compelling symbol for Anglo-Australian competition in a series of (usually five) test matches conducted over a season. The Ashes concept emerged after the Australian team defeated England for the first time on its home soil at The Oval, London, in 1882. There followed two mock obituaries in the English press lamenting the “death of English cricket,” stating that the body would be cremated and the Ashes taken to Australia. What started as a joke became a serious metaphor of Anglo-Australian competition.

The Ashes Trophy consists of a small and fragile terra-cotta urn that contains a set of ashes, said to be the ashes of English cricket. Mystery surrounds the origin of the ashes, and there are many competing myths regarding their origin. It is likely that two women wanting to perpetuate the joke burned a bail, a stump, or a ball that they placed in the urn and gave to the visiting English captain, Ivo Bligh, in 1883 after an English victory. The ashes were later given to the Marylebone Cricket Club, and the trophy remains on display there in its museum.

—Richard Cashman

The professionals paved the way for the growth of international cricket. The role of the professional in the rise of international cricket has not been properly recognized because amateurs held the positions of power in the cricket world. There was a sharp social divide, and segregation between amateur (that is, “gentlemen”) and professional cricketers—with separate accommodations, dining, and even travel—continued well into the twentieth century.

In the twentieth century cricket became popular in many countries of the British Empire such as Australia, where a determination to beat the motherland at its own game provided a powerful incentive for cricket playing. The first test match between Australia and England in Melbourne in 1877 was between an English professional team and an Australian Eleven (the national team). International tours and test matches became a regular feature from that time. South Africa became a test match-playing nation in 1889 and was followed by the West Indies, New Zealand, India, Pakistan, Sri Lanka, Zimbabwe, and Bangladesh in the twentieth century.

The Organization of Horse Racing in Eighteenth-Century England

Although horse racing in one form or another has existed since ancient times, the modern version of the sport took shape in eighteenth-century England. Introduced in England in the late twelfth century, horse racing flourished at fairs and markets until the middle of the seventeenth century, when the Puritans banned it along with other sports and entertainment from 1649 to 1660. Sports and entertainment resumed with the restoration of the Stuart monarchy in 1661, and horse racing found an avid supporter in Charles II, who maintained a stable of race horses and erected a private racecourse at Newmarket near Windsor Castle. Newmarket became a horse-racing hub, and periodically Charles would retreat to the village to attend races, sometimes competing in them himself. Owners often raced their own horses then, but by the end of the seventeenth century they began to employ professional jockeys.

After the death of Charles II in 1685, horse racing continued to receive royal patronage from William III (r. 1688–1702) and Queen Anne (r. 1702–1714). Like Charles, William maintained a stable of race horses and attended and bet extensively on races. Anne, on the other hand, had more business and organizational interests in the sport. She opened the Royal Ascot racecourse on August 11, 1711, with a race in her honor, “Her

➤ TREGONWELL FRAMPTON

Regarded as history's first professional race horse trainer, Tregonwell Frampton maintained the royal stables for several English monarchs in the late seventeenth and early eighteenth centuries. Born in Morton, England, on April 3, 1641, Frampton developed a keen interest in cockfighting, falconry, hare coursing, and horse racing as a youth. Recognized as the best falconer in Derbyshire in the early 1670s, he moved to Newmarket to race horses full-time. Having gained a reputation for producing and riding champion horses, Frampton became the royal horse race trainer under William III after winning the Newmarket Town Plate with one of the king's horses in 1695. Known for his unscrupulous tactics, Frampton remained in royal service until his death on March 12, 1728.

—Adam Hornbuckle

Majesty's Plate," in which seven horses competed in three separate 4-mile (6.4-kilometer) heats for a purse of 100 guineas. In addition to founding the Royal Ascot, she promoted the early development of the thoroughbred, a line of horses bred specifically for racing. Anne introduced the Darley Arabian, based primarily upon three stallions, the first of which, Byerley (Bylerly) Turk, settled to stud in Middridge, England, in the late 1680s. The Darley Arabian stallion was brought to England from Syria by Thomas Darley to the genetic line in 1704. The third stallion, the Godolphin Arabian, named for his owner Francis Godolphin, Second Earl of Godolphin, joined the line in 1729.

With the succession of George I to the English throne in 1714, organizational interest in horse racing passed from the throne to the gentry and the titled nobility. Owners such as Godolphin gained control of the sport, providing it with formality and rules. Before races, owners and jockeys convened to decide and agree upon the length of the course, weights of the mounts, number of heats, judges, and riding protocol. Owners brought formal organization to horse racing not so much to promote sportsmanship but to protect their investments, as formal organization provided both predictability in betting and expansion for greater profits.

In 1750 London race horse owners and breeders established the Jockey Club to administer races at Newmarket by establishing rules of dress and behavior for jockeys and appointing judges, starters, clerks, and other racing officials. By the end of the century the Jockey Club had exerted its influence throughout the entire English horse-racing scene, bringing standardization and order to the sport.

Toward the end of the eighteenth century the rise of horse-racing publications and auction and gambling houses also contributed to the organization of the sport. In 1770 James Weatherby began publishing the *Racing Calendar*, at the time the nation's foremost horse-racing publication. By disseminating racing news, printing racing schedules, and publishing rules and regulations, the *Racing Calendar* brought order to a sport that had expanded significantly during the century. In 1766 Richard Tattersall opened an auction house near Hyde Park Corner outside London. With two subscription rooms reserved for members of the Jockey Club, the Tattersall's became the meeting place for horse-racing's aristocratic elite.

Association Football

Association football, also called soccer, is an outdoor sports game that has become the world's most popular international team sport. The game has eleven players to a side. The object is to advance a round ball about 28 inches (71 centimeters) in circumference into the opponent's goal. The game (usually called a match) is played on a rectangular grass field measuring 120 by 75 yards (110 by 68.6 meters). Centered on each end-line is a netted goal 24 feet (7 meters) wide

by 8 feet (2.4 meters) high, guarded by a goalkeeper, the only player allowed to use his or her hands. The other ten players attempt to advance the ball past their opponents; they are limited by rules such as the no-hands rule, offside, and dangerous play. A referee, who is assisted by linesmen (currently termed “referee’s assistants”), regulates the match. The referee has the power to issue yellow and red cards to the players for dangerous play or for arguing. A player receiving two yellow cards or one red card in a match is disqualified, and his or her team is at a disadvantage for the remainder of the match. The match is composed of two forty-five-minute halves, and substitutions are limited. The referee has the discretionary power to add injury time to each half.

Countries that can claim ancient games similar to football include China (*tzu chu*), Japan (*kemari*), Greece (*episkyros*), and Italy (*harpastum* and *calcio*). Yet the game from which the modern version of football has developed began in England. The first recorded game of football was probably at Ashbourne in Derbyshire on a Shrove Tuesday (the day preceding Ash Wednesday), some time in the third century. Although some early games were relatively highly structured, most were crude versions of the current game and often little more than street battles. Because of the violence associated with it, the game was often banned in England over the centuries. Despite frequently being outlawed, its popularity—particularly in public schools—persisted into the nineteenth century, when formal rules were introduced.

The first formal rules for association football were drafted at Cambridge University in 1848. On October 26, 1863, eleven London clubs met at the Freemason’s Tavern and voted upon a set of formal rules for club play that closely followed the Cambridge rules. The clubs that dissented from the newly established rules went on to form the modern version of rugby, while the remaining clubs formed the Football Association. The first concern of the Football Association was to establish universal rules under which to compete; by the late 1870s, the Football Association was recognized as the governing body of English football.

Perhaps the most influential individual in promoting the modern version of association

football was Charles W. Alcock (1842–1907). Alcock promoted the Football Association as a universal rules committee and came up with the idea for a cup competition that would become the FA cup. The first FA cup final was played in 1872, with the Royal Engineers losing to the Wanderers, captained by Alcock himself.

The FA cup helped to popularize football in England, and the idea of professionalism quickly took hold and increased the quality of play dramatically. As a result, the Football League was founded in 1888, with its Scottish equivalent following in 1890. The first international match occurred in 1872 between Scotland and England.

The spread of football outside of England, mainly due to the British influence abroad, started slowly, but it soon gathered momentum and spread rapidly to all parts of the world. When the Fédération Internationale de Football Association (FIFA) was founded in Paris in 1904, its original members were France, Belgium, Denmark, the Netherlands, Spain (represented by the Madrid FC), Sweden, and Switzerland. Germany did not send a representative but cabled its intention to join. British missionaries introduced the game to Africa, where they hoped it would teach discipline, teamwork, and selflessness. The first African football associations came into existence in South Africa in the 1910s. English settlers introduced the game to New Zealand and Australia in the 1880s, although in each country, rugby football became more popular. In North America, the primitive form of football had arrived with the early English settlers. Although football has been present for more than 300 years in North America, as a professional spectator sport it has not gained the popularity that it enjoys in other parts of the world. In Canada and the United States football took a back seat to hockey, baseball, basketball, and variations of football similar to rugby (US and Canadian football).

Football gained its most enthusiastic reception in Latin America. In the 1860s, British sailors brought the game to Argentina. The Argentine Association Football League was formed on February 21, 1893; it has been called the Argentine Football Association since 1903. Football was imported to Brazil in 1894, where it has become immensely popular. The Uruguayan Football

Association was formed in 1900, and the Paraguayan Football Association followed in 1906. Football rapidly gained popularity in Central America as well. Football was introduced to the modern Olympic Games in 1908, with England winning the title. The FIFA World Cup, presently the world's most closely followed sports competition, began in 1934, with Uruguay winning the first title.

Rugby Football

Rugby football is a modern sport whose evolution and diffusion outside of England were shaped by class-specific values and British imperialism. A forerunner of American football, rugby is a game in which players have 80

minutes to score by kicking an oval-shaped ball over the crossbar of an H-shaped goal or by touching down the ball in the try zone beyond the goal. Two teams of 15 players (in the Rugby Union version of the game) or of 13 players (in the Rugby League) compete to advance the ball by kicking, passing, or pushing contests called scrums toward the try zone. They defend against the advance of the opposing team by tackling. Both versions of rugby have their origins in the varied forms of premodern English winter folk games. In the 1820s and 1830s, rugby became a distinct game from soccer when students at English public schools (private institutions), with whom ball sports were most popular, began to carry rather than simply kick the ball.

The students of Rugby School under the headmastership of Thomas Arnold (1795–1842) fixed the rules of this form of football in 1845 and legitimated the sport as a test of manhood, Christian values, and skill that surpassed other elite field sports such as hunting and fishing. Baron Pierre de Coubertin (1863–1937), founder of the modern Olympic Games, visited Rugby School and other public schools in 1883 and initiated the popularization of rugby in France. The rules set down by Rugby School were further codified at Cambridge University in 1863 by public school graduates where, along with Oxford University, adult public school alumni had been playing rugby since the 1840s. After the foundation of the Football Association in 1863, former public school students formed a separate Rugby Football Union (RFU) in 1871, the first such union in the world. From its elite traditions within the public schools, rugby spread first

INTERNATIONAL RUGBY

The International Rugby Board (established in 1886) governs the rules and competitions for international Rugby Union teams. In the 1880s the national teams of South Africa, New Zealand, and Australia hosted the English national team, toured in England and between colonies, and often beat England. International rugby officially began in 1883 when England, Scotland, Wales, and Ireland competed in the Home Nations tournament, adding France in 1910. Rugby Union football was

a popular sport at the Summer Olympics before its removal in 1924. The first international Rugby World Cup, held every four years, took place in New Zealand and Australia in 1987. Eighty national teams from six continents compete for 20 spots in the Rugby World Cup. New Zealand, Australia, South Africa (which was banned from participation during 1985–1992 due to its system of apartheid), and England have each won.

—Garrett Washington

among upper-middle-class former students and then to working-class men in England's northern counties during the 1870s.

Elite RFU players espoused the values of amateur play and denounced working-class rugby practices of ranking teams, organizing regular multiteam competitions, and, most importantly, paying players for work missed. These tensions led to a split in 1895 when 22 teams, primarily from the northern counties, seceded from the RFU and founded the Northern Union (NU), which aimed to pay players and attract spectators. The NU legalized the payment of players (1898), increased the excitement for spectators by reducing the number of players on the field from 15 to 13 (1906), and adapted the rules to make rugby more continuous, less violent, and hence more spectator-friendly (1897–1906). Rugby League, referring to the NU style of rugby, was the form most popular outside of the upper-middle class and the elite circles of public school alumni and spread more quickly within England and to Wales and Ireland than the RFU form, known as Rugby Union. Since the 1960s, the Rugby Union game has moved rapidly toward professionalization, removing player compensation limits (1995) and becoming the most popular form of the game today.

The modernization of rugby led to its increased popularity and its spread across the globe. English colonists and shipmen began exporting rugby to British colonies in the 1860s and formed teams that toured abroad, providing the basis for international rugby today. The national teams of the former British colonies Australia (1899), New Zealand (1888), and South Africa (1889) have dominated the sport since the early twentieth century, losing occasionally to the French and English national sides. Rugby is currently played by both men and women in over 100 countries.

Baseball

Baseball evolved in the United States during the nineteenth century and by the early twentieth century had assumed its modern form, with two established major leagues consisting of clubs in the major American cities. Baseball at this time was considerably more popular than any other sport in the United States and was commonly referred to as the National Game or the National Pastime.

An early explanation of the origins of baseball was that it had been invented by Abner Doubleday in Cooperstown, New York, in 1839 (hence the location of the sport's Hall of Fame in that town). However, it is now recognized that baseball evolved gradually out of a series of bat-and-ball games common in the American Northeast that in turn had origins in games played in England. An important milestone was achieved when an amateur club, the New York Knickerbocker Base Ball Club, formulated a set of rules

A professional baseball team that played in New York City from 1880 to 1887, the New York Metropolitans are pictured in 1882. They played in the Polo Grounds, just north of Central Park. (Library of Congress)

CY YOUNG

One of the greatest pitchers in the history of baseball, Cy Young (1867–1955) played 22 years, from 1890 to 1911, with clubs in Cleveland, St. Louis, and Boston. He was a member of the Boston Americans (later the Red Sox), the team that won the first World Series in 1903, and he pitched a perfect game (a complete game without any batters reaching base) in 1904. Playing at a time when pitchers routinely completed almost every game they started and pitched far more often than today, he set all-time marks in wins (511) and complete games (749) that will likely never be broken. Young was elected to the Baseball Hall of Fame in 1937.

—Wesley Ferris

that became the basis of modern baseball. In the 1840s and 1850s amateur baseball clubs composed of clerks and skilled artisans proliferated, particularly in and around New York City. In the early 1860s the American Civil War helped to spread the game throughout the United States.

Amateur baseball began to be supplanted by professional baseball in the late 1860s. The Cincinnati Red Stockings, the first club to pay all of its players in 1869, went undefeated that year with a record of 57 wins and no losses. Professionalization reflected an increasing commercialization of the game as baseball grounds were enclosed and fees charged for admittance. In 1876 the first modern professional league, the National League, with clubs in eight cities was formed, followed in 1881 by the American Association, sometimes referred to by its critics as the Beer Ball League because it cut admission prices, sold liquor at games, and played games on Sunday. Power within the sport shifted from players to the clubs and their owners when the owners of clubs in the two leagues agreed in 1882 on the reserve clause, which forced players to remain with their current club until they were traded or released. Low salaries and abuses connected with the reserve clause led in 1890 to the formation of a rival Players' League in which players and management shared revenues equally. National League owners launched a vigorous campaign to undermine the new league,

which went out of business in 1891. Among the star players of late-nineteenth-century baseball were first baseman Cap Anson, outfielder Willie Keeler, and pitcher Cy Young.

Commercialization of baseball was not limited to the founding of professional teams. In 1876 a star player, Albert Spalding, founded the sporting goods company A. G. Spalding and Brothers, and his Chicago-based firm soon established a near nationwide monopoly on the sale of baseball equipment, including bats, balls, gloves, and catchers' masks. In addition to brewers who sought to promote their beer by identifying their product with baseball clubs, tobacco companies tried to increase sales by including picture cards of ballplayers in packages of cigars and cigarettes.

Several other professional leagues were formed in the late nineteenth century, and numerous minor leagues, both professional and amateur, existed throughout the United States, but only the National League remained as a major league in 1900. In 1901 the American League began to challenge the dominance of the National League, leading to several years of open conflict including clubs raiding the opposite league for players and the location of multiple clubs in the same city in an effort to drive out the other league. Peace was agreed to in 1903 that recognized both leagues as major leagues, symbolized by the holding that year of a World Series championship between the two league champions to determine the overall champion. Baseball in the early twentieth century was known as the dead-ball era, as pitching dominated and run production declined with very few home runs.

In the early days of baseball, there was the occasional presence of African American players on otherwise white clubs, including several in the early years of the National League. However, many white players, such as Adrian C. "Cap" Anson, the player-manager of the Chicago White Stockings, refused to play with African Americans, and from the 1880s African Americans were barred from the major leagues by the unwritten but strictly enforced color line. Although the first professional African American baseball clubs were formed in the 1880s, it was not until after World War I that regular African American leagues were formed. Baseball in

its early days was also overwhelmingly a male sport. Analysis of crowd pictures of early games shows that more than 90 percent of the spectators were male.

Baseball in Meiji Japan and Latin America

The modern game of baseball, having evolved from English and Gaelic games such as cat, cricket, and rounders in the early 1800s, rapidly became the most popular sport in the United States in the second half of the nineteenth century. Baseball also gained a wide following in Japan and Latin America, especially Cuba.

In the late nineteenth century, struggling under unequal treaties with the great powers of Europe and the United States, many Japanese came to see sport as an opportunity to demonstrate that contrary to negative foreign stereotypes, they were neither physically nor intellectually inferior to Westerners. In the 1860s U.S. civilian and military residents began playing baseball in Japan's treaty ports but prohibited Japanese from watching or playing the game. U.S. teachers, however, recruited to both educate and Westernize elite Japanese students, argued that sport was vital for educating Japan's future leaders. William E. Griffis (1843–1928), who served as superintendent of education for Ichizen Province and later had a distinguished career as a writer and lecturer, drew attention to the need for sport in a balanced curriculum through his *New Japan Series of Reading and Spelling Books* and frequent meetings with Japanese students, instructors, and government officials. Meanwhile, English professor Horace Wilson (1843–1927) at Tokyo University and other American teachers introduced the game of baseball to their students in the early 1870s.

Although railroad workers in Tokyo formed Japan's first recorded baseball team in 1878, high

▶ EARLY HIGH SCHOOL AND COLLEGE BASEBALL IN JAPAN

The success of the Ichiko high school baseball team in Japan in the 1890s was followed by the success of the Keio University and Waseda University teams (Tokyo), primarily composed of Ichiko graduates who would forge even stronger connections between Japanese and American baseball. Between 1905 and 1915, both college teams toured the United States and played against universities such as Stanford and Millikin, while universities including Chicago, Wisconsin, Washington, and Stanford sent their teams to Japan as well.

—Garrett Washington

school and college baseball at first dominated the sport. In particular, the First Higher School of Tokyo (Ichiko) formed a team in 1890 that succeeded after six years of refusals in convincing the American team of the Yokohama Athletic Club (a foreigners' club, endowed with Japan's only true baseball stadium at the time) to play against them in the summer of 1896. The three consecutive and substantial victories of the Ichiko team over the U.S. sailor-led Yokohama team forced Westerners in Tokyo to reevaluate their Japanese stereotypes. It also began Japan's love affair with baseball.

Although high school and collegiate baseball remained the emphasis for the sport in Japan, frequent contact with U.S. teams encouraged the professionalization of Japanese baseball. In 1907 the country's first admission-charging baseball game was played, and in 1934 the Yomiuri Giants (Tokyo) and Hanshin Tigers (Osaka) became Japan's first true professional teams. In 1936 the Japanese Baseball League was formed, laying the foundation for the Pacific League and the Central League of today's professional baseball circuit in Japan.

In Latin America, baseball was first introduced to Cuba in the 1860s by students returning from studies in the United States and by U.S. sailors. Despite an 1868 ban on baseball playing by Spanish officials because of its "anti-Spanish" and "insurrectionist" tendencies, the game grew in popularity. The first recorded game was

played in December 1874 between Club Matanzas and Club Habana, and the first league, consisting of Matanzas, Habana, and Almendares was organized in 1878. In the 1880s and 1890s, the league expanded and was professionalized. After the ban was lifted against black players, many stars from the American Negro leagues played winter ball in Cuba. Cuban sugar planters introduced baseball to Dominican plantation workers in the 1870s as a diversion from their harsh working conditions. Cubans, along with U.S. servicemen and workers, were instrumental in introducing the game to Puerto Rico, Venezuela, and Mexico. Seamen on USS *Montana* first played baseball in front of Mexicans in Guaymas in 1877, and U.S. railway laborers in Nuevo Laredo encouraged Mexican workers to take up the game. In 1887 Mexico City residents formed their own ball club. By 1925 Mexico City had several teams that constituted the core of Mexico's newly inaugurated professional Mexican Baseball League of five clubs, largely due to the promotional efforts of sports journalist-turned-league president Alejandro Aguilar Reyes (1902–1961), known as “Fray Nano.”

Ice Hockey

Ice hockey emerged in eastern Canada from the 1860s to the 1880s. Soon it gained popularity in the rest of Canada and gained a following in the northern United States. By 1914 many North American professional leagues had appeared, and a few Europeans also had adopted the sport.

For hundreds and even thousands of years in different parts of the world, people had enjoyed games in which goals were scored by using a stick to send a ball or ball-type object (a rock, perhaps) over a line or into a goal. Over the course of two or three decades late in the nineteenth century, eastern Canadians developed a distinctive stick-ball-goal sport that became known as ice hockey. It incorporated rules and conventions used in various games already familiar to Northern Europeans or Native Americans, including hurling (hurley), shinty (shinny), ricket (wicket), field hockey, lacrosse, bandy, and rugby. A landmark event in the development of a unique sport was the first match played indoors, at Montreal's Victoria Rink on March 3, 1875.

Over the next four decades after 1875 the rules, equipment, and strategies of hockey evolved, primarily in Canada. The original puck was a disc made of wood, but soon pucks were made of vulcanized rubber. The players gradually adopted protective equipment, and their sticks and skates became far more efficient and satisfying than those used in early matches. By the twentieth century the game was played on ice surfaces that were (ideally) similar in size to the one in Montreal's Victoria Rink (the accepted standard becoming 200 feet by 85 feet [61 by 26 meters]), but a major difference was that the ice was surrounded by high boards that protected spectators and kept pucks in play. In early hockey games players were off side if ahead of the puck, but early in the twentieth century the rules were adjusted to avoid constant stoppages and to encourage combination or scientific play.

Prior to the First World War hockey was referred to as a manly sport. This term meant that it tested qualities that males should possess, including physical toughness and courage. However, most people considered female hockey acceptable, provided it was not as violent and competitive as the male variety. In Canada, many women's teams were formed beginning late in the 1880s.

By the 1890s the top male hockey players in Canada were superior athletes who were recruited by teams in cities where indoor arenas could hold large numbers of spectators. Beginning in 1893 many of these teams competed for the Stanley Cup, emblematic of Canadian

➤ ARTIFICIAL ICE

After the First World War hockey became a popular international sport and a major North American professional sport. These developments would not have occurred without the creation of artificial ice in the nineteenth century.

Artificial ice is made when a thin layer of water is spread over a cold floor. The floor is cooled by a solution pumped through pipes below the surface. Above the floor and all around it, the air can be warm enough that spectators can watch hockey games (or other ice events) in comfort. Artificial ice was one result of nineteenth-century efforts to develop refrigerators. The early cooling agent usually was ammonia. By the 1870s a few small skating rinks had artificial ice. The first hockey

game on artificial ice probably occurred in Baltimore in 1894. Soon such games took place in other large U.S. cities.

Artificial ice made it possible for hockey to become popular anywhere. Early in the twentieth century, even in Canada's comparatively cold climate, the construction of artificial ice arenas seemed desirable. Spectators liked them, and many natural ice games had been ruined by untimely thaws. The first of (eventually) hundreds of Canadian artificial ice arenas were built in Vancouver and Victoria in 1911 to host the games of the new professional Pacific Coast Hockey Association.

—Morris Mott

hockey supremacy. High-caliber matches generated gate revenues that far exceeded the expenses that the hockey clubs had for travel and ice rental. Players were aware of this fact. Usually for various reasons they wanted to retain their status as amateurs, but they accepted money or other rewards and were in fact professionals.

Openly professional leagues and teams appeared early in the twentieth century, first primarily in Pennsylvania and northern Michigan, then in various parts of Canada. By World War I several professional leagues had been founded. One league that seemed to have a future was the National Hockey Association, which had been formed in 1910. By 1914 the association had franchises in the large cities of Ontario and Quebec. It became the National Hockey League in 1917.

By 1914 Canada was the home of ice hockey, but the game had adherents in the United States as well as in several countries in Western Europe. In 1908 the International Ice Hockey Federation (IIHF) was formed by representatives from France, Switzerland, Great Britain, and Belgium. In 1910 the IIHF arranged the first European Championship tournament. After World War I, the IIHF facilitated the spread of hockey to new countries. Also, it oversaw the entry of ice hockey into the Olympic Games (1920) and the development of the annual World Championship (1930).

American Football

American football developed in the nineteenth century, first at the collegiate level. It was originally the result of a merging and transformation of two English sports, English football (soccer) and rugby. While there is some dispute as to what game should be considered the first official American football game, most historians agree that the game began in the decade following the American Civil War.

There were various forms of football being played on American campuses in the 1860s, often as an expression of interclass rivalry. In November 1869, Rutgers played Princeton in New Brunswick, New Jersey, in what has often been

Scenes from the football game between Yale and Princeton played at Manhattan Field in New York City on Thanksgiving Day, 1891. (Library of Congress)

referred to as the first American football game. The field was much larger then, and each team fielded 25 men in a chaotic scramble after the ball. Players attempted to advance the ball by either kicking it or hitting it with the hand or fist. The victory went to the first team to get the ball through the stationary posts in the opponent's goal six times, and Princeton had the honors, winning 6–4. Most of the rules of this early game were based loosely on soccer.

By 1874, several colleges were fielding football teams. Of great consequence was an international game played that year in Cambridge, Massachusetts, between Harvard University and Montreal's McGill University. Since the teams had different rules, two games were played. While Harvard favored the soccer style of play with just a few exceptions, McGill's team favored the rugby style, complete with scrum line. Harvard players came away with a new appreciation of the advantages of the more rugby-oriented play.

Student representatives of perennial rivals Yale and Harvard were determined to have a football match in 1875, and meetings were held to decide what rules should be enforced. Harvard's advocacy of the rugby style of play won out, and as a result the game more closely resembled the modern game, with 15 players fielded per team and carrying the ball, lateral passing, and tackling permitted. In 1876 the American Intercollegiate Football Association (AIFA), comprised of Columbia, Harvard, Yale, and Princeton, came into existence, with the purpose of

settling on rules changes for intercollegiate play. Through this institution many rule changes would eventually be instituted, such as the change from a round to an oval ball.

No one effected rule changes in the early period more than Walter Camp (1859–1925), known as the “father of American football.” Camp was the star running back for Yale for six years (1876–1882) as an undergraduate and then as a medical student. He dominated the early rules discussions and became the game's greatest innovator. His arguments brought about the line of scrimmage in 1880, thus allowing the offensive team to run set plays rather than the continuous mad scramble for the ball. This change clearly demarcated American football as a sport different from rugby or soccer and set in motion a series of changes that quickly followed. In addition, in 1880 the AIFA reduced the size of fielded teams to 11 (the recognized number today) and made the field smaller.

Because the new scrimmage line encouraged teams to try to maintain possession the entire game by using delay tactics, even if it meant giving up yardage consistently, Camp instituted the safety rule, which penalized the offensive team for being tackled in its own end zone. By 1882 a system of downs was instituted, allowing the offensive team three chances to advance 5 yards (about 4.5 meters). Fields were marked with lines every 5 yards for this purpose, and the resulting gridiron became one of the game's most notable features. Other important changes allowed blockers to run interference for the ball carrier and defensive players to make tackles below the waist. The scoring for touchdowns and field goals continued to be modified.

The new rule changes helped increase the sport's popularity, and football soon spread beyond the confines of elite universities. By 1900 more than 40 universities were fielding football teams, and thousands of spectators attended the matches. The popularity of football also reached across the nation in the form of local athletic clubs. In 1892 the Allegheny Athletic Association became the first team to pay a player, William Heffelfinger, making him the first paid professional American football player.

The sport was harshly criticized as barbaric in some circles, and it was not uncommon for

► BLACK PIONEERS IN EARLY AMERICAN FOOTBALL

While few African Americans had the opportunity to play football in the early stages of the game, Walter Camp did not shy away from naming black players to his Walter Camp All-America team. In back-to-back years, 1892 and 1893, Camp selected African American William Henry Lewis of Harvard for the position of center-rush. The first black collegiate football player, who played at Amherst College before attending Harvard as a law student, Lewis was one of the few blacks playing at white universities during an age of increasing segregationist restrictions, upheld by the 1896 *Plessy v. Ferguson* Supreme Court decision.

On the professional side Charles W. Follis, who had starred on his Wooster, Ohio, high school team, became the first paid black professional football player when he signed a deal with the

Shelby (Ohio) Athletic Club in 1904. Follis was an exceptional player, scoring an 83-yard (76-meter) touchdown in the first game after his signing. He endured jeers, taunts, and threats from opposing crowds. In one game against Toledo, the epithets hurled at Follis were so disturbing that the Toledo team captain, Jack Tattersoll, stopped the game and screamed at his own fans, saying, "Don't call Follis a nigger. He's a gentlemen and a clean player and please don't call him that."

players to be horribly injured and even die. Such was the brutality of the game that in 1905, 19 players were killed. In 1906, in an effort to free up the game and reduce its violence, John Heisman (1869–1936), the outstanding coach at Auburn University, led the charge against the now more conservative camp to institute the forward pass. Heisman won, and the pass was legalized. This gave football a dynamic feature that has remained with the game ever since.

While the game spread quickly through the nation's colleges (the first Rose Bowl game featuring an East team, Michigan, versus the West team, Stanford, played in 1901), the professional aspect of the game was centered primarily in Ohio. In 1920, in an effort to control rising salaries, standardize contracts in order to prevent team jumping by players, and regulate the rules of the game, the American Professional Football Association, forerunner of the National Football League, was created.

Athletics—Track and Field

Athletics, or track and field as it is more commonly known, is one of the world's oldest sports. Prehistoric men developed running, jumping, and throwing skills for survival. Ancient Egyptian and Mesopotamian artists depicted men practicing these skills, and the Greek poet Homer described athletic displays in the *Iliad* and the *Odyssey*. The first recorded athletic competition came in the form of a stade, a 200-meter (219-yard) race, in the Olympic Games in 776 BCE. At the height of the Olympic Games, the track and field program consisted of footraces ranging in distances from 200 to 4,800 meters (approximately 3 miles), discus and javelin throws, and the standing long jump. In addition to the individual events, the Olympics also included the pentathlon, composed of the 200-meter race, discus and javelin throws, the broad jump, and wrestling. In addition to the Olympic Games, track and field comprised the Pythian Games, Nemean Games, and Isthmian Games as well as the Heraea Games for women.

<i>US Standard</i>		<i>Metric Standard</i>	
<i>Event Distance</i>	<i>Metric Equivalent</i>	<i>Event Distance</i>	<i>U.S. Equivalent</i>

		3.5 kilometers	2.1 miles
		20 kilometers	12.4 miles
		30 kilometers	31.1 miles

Organized track and field competition vanished with the end of the Olympic Games in the fourth century; however, throughout the Middle Ages noblemen practiced running, jumping, and throwing in addition to horseback riding, jousting, and fencing. After pedestrianism, or long-distance race walking, enjoyed great popularity in England during the eighteenth and nineteenth centuries, track and field reappeared as an organized sport in the nineteenth century as part of English public school and university physical education and athletic programs. Eton introduced track and field as an interclass, or intramural, sport in 1837, followed by Exeter and Oxford in 1850. At the university level, Cambridge and Oxford held intramural track and field meets in 1857 and 1860, respectively. In 1864 Oxford and Cambridge competed against each other in the first intercollegiate track and field meet. The meet consisted of eight events; each team won four events. Oxford athletes won the 100- and 440-yard dashes and the high and long jumps, while Cambridge runners claimed the 1-mile run, the 120- and 200-yard hurdles, and the 2-mile steeplechase. In 1873 the Intercollegiate Association of Amateur Athletes of America held the first collegiate track and field championship in the United States, and in 1894 Yale University competed against Oxford in England.

England held the first national track and field championship on March 23, 1866. Sponsored by the London Amateur Athletic Club, the meet was held at Walham Green in London. The London Athletic Club continued to sponsor the national championships until 1880, when the Amateur Athletic Association assumed control of the event. In 1876 the New York Athletic

Club held the first national track and field championships in the United States. The New York Athletic Club continued to sponsor the national championships through 1878, after which the National Association of Amateur Athletics of America took it over. In 1888 the newly formed Amateur Athletic Union sanctioned the meet until 1978. On September 21, 1895, the London Athletic Club and the New York Athletic Club met at Manhattan Field in the world's first international track and field meet. Underscored by decisive victories by Bernard Wefers in the 100- and 220-yard dashes and Thomas Conneff in the 1- and 3-mile runs, the Americans defeated their British counterparts in all 11 events held that afternoon.

The revival of the Olympic Games in 1896 provided a major stimulus toward the expansion of the track and field program. Beginning with 11 events in 1896, the program expanded to 29 in 1912. Of the 29 events contested in 1912, 20 have remained as part of the track and field program and form the basis for most modern track and field meets. Track events (now measured in meters) include the 100-, 200-, 400-, 800-, 1,500-, 5,000-, 10,000 meter runs; the 110- and 400-meter hurdles; the 3,000-meter steeplechase; and 4 x 100 and 4 x 400 meter relays. Field events include the high jump, pole vault, long jump, triple jump, shot put, discus throw, hammer throw, and javelin throw. The 10-event decathlon, contested over two days, consists of the 100 meters, long jump, shot put, high jump, and 400 meters on the first day and the

110-meter hurdles, discus throw, pole vault, javelin throw, and 1,500-meter run on the second day. The 26.2-mile (42.2 kilometer) marathon, part of the Olympic program since 1896 to commemorate the legendary run by Phidippides to inform the Athenians of the Greek victory over the Persians at Marathon in 490 BCE, is held separately from most track and field meets. In 1908 the Olympics incorporated race walking into the athletics program, with 3.5-kilometer and 16-kilometer events. Since 1956 the standard Olympic race walking distances have been 20 and 50 kilometers. In 1928 the Olympics included 5 events for women (the 100- and 800-meter runs, high jump, discus throw, and 4 x 100 meter relay), and by 2008 women competed in most of the same events as the men except for the 50-kilometer walk and the 100-meter instead of the 110-meter high hurdles and the heptathlon instead of the decathlon.

With the Olympic Games, track and field gained worldwide popularity. In 1912, 17 national track and field federations met in Berlin to form the International Amateur Athletic Federation (IAAF). Providing the sport with an international governing authority, the IAAF standardized the events and equipment and approved world records. In 1914 the IAAF published the first official track and field world records. As the International Association of Athletics Federations, the IAAF continues to govern the sport track and field.

Sports and Nationalism— The Gaelic Athletic Association

The Gaelic Athletic Association (GAA) is the Irish amateur athletic association that focuses on the promotion of traditional Irish sports as a means of promoting Irish nationalism. The GAA's first meeting, held on November 1, 1884, in Hayes's Hotel in Thurles, was attended by seven men, including founder Michael Cusack and one of Ireland's best-known athletes of the day, Maurice Davin. The GAA strove to align itself with various Irish nationalist movements, including the Irish Republican Brotherhood (IRB). In fact, the first three patrons of the GAA were not affiliated with the IRB: Archbishop Thomas William Croke, a strong supporter of an independent Ireland; Michael Davitt, founder of the Irish National Land League; and Charles Stewart Parnell, a Protestant who led Irish Parliament representatives in William Gladstone's government. As the organization sought to assert pride in Irish heritage through sport, the GAA prohibited its athletes from participating in or attending sports events that were considered foreign, a ban that was not lifted until 1971.

The GAA was not the only group seeking to promote Gaelic athletics. The main rival of

➤ HURLING

Hurling is an Irish field game played with wooden sticks (*caman*) that have a slight outward curve at the bottom in order to strike a hard ball (*sliotar*) toward a goal. The ball may be hit on the ground or in the air using the caman or balanced and carried on the end of the caman. A goal may be scored by driving the ball under the goal post (as in soccer) or by using the caman to get the ball over the goal post.

Legend has it that the ancient kings of Ireland played an early form of hurling, a version considered so violent that ancient rules dictated punishment for deaths caused during hurling match play. Today, hurling remains a rather violent game and is often linked to masculinity, a fact not overlooked by the Gaelic Athletic Association (GAA) when it chose to resurrect the sport in the late nineteenth century.

—Lindsay Krasnoff

the GAA was the Irish Amateur Athletic Association (IAAA), formed in 1885. The IAAA was composed mainly of Protestants and Unionists, thereby acting as a foil to the more Catholic GAA. The GAA sought to differentiate itself from the IAAA by emphasizing the native games of Ireland and by its selection of sports-playing days. The IAAA did not hold games on Sundays, in observance of the Sabbath; however, this was in contradiction with the schedule of the average workingman, whose only day off was Sundays. In sponsoring games on Sundays, the GAA sought to undermine the IAAA and reinforce its commitment to Irishmen.

The GAA's mission was not only to promote Irish athletics but also to make sports accessible to the everyday worker and artisan. Therefore, although in the early years the GAA emphasized different sports, it soon settled on sports that cost little to play and could easily be pursued by anyone. To this end, the four main sports of the GAA were handball; rounders, a close cousin to American baseball; hurling, a cross between lacrosse and field hockey; and Gaelic football, a game that was more a mix of rugby and soccer. Rules for these games were codified in the 1880s, and by 1887 the GAA sponsored the first All-Ireland championships for hurling and Gaelic football. There is irony in the introduction of codified rules and championship competitions—British sports practices first introduced in the Victorian period—into an Irish nationalist athletics group.

By the turn of the century, hurling and Gaelic football emerged as the most popular sports among players and spectators, and subsequently these two sports received the most focus from the GAA in following years. The events that solidified these sports' dominance within the GAA were the All-Ireland championships of 1903. For all GAA championships, there was one decisive winner; no ties were allowed for a championship match. Therefore, the rules stipulated that a tie must be replayed. If the replay match ended in a tie, then there was an additional 30 minutes of play time added to the clock, or another replay match would be required to break the tie. The 1903 championship games for both hurling and Gaelic football spanned three games due to this no-tie rule. Each match drew more

spectators than the last, thus creating the first mass-spectacle athletic events in Ireland.

The Professionalization of Sports in Europe and the United States

The professionalization of modern sport within Europe and the United States occurred from the mid-nineteenth century to the early twentieth century. One major factor was increasing urbanization, which coincided with greater leisure time enjoyed by the working classes and an increase in wages. The emergence of a standard set of rules and regulations for most sports and the establishment of organized governing federations—at both the national and international levels—both reflected and aided the movement toward professionalization.

The process of codification of game rules began in Great Britain in the 1850s with association football (known to Americans as soccer), one of the first sports to be regulated. The first codified rules of soccer were drawn up at Eton in 1815 and were followed by the Cambridge Rules of 1848. Soccer was also one of the first sports to be institutionalized, professionalized, and governed at the international level. The first professional association was the Football Association of England (FA), which formed in 1863. The international governing body of soccer, the International Federation of Football Association (FIFA), was established by Frenchman Jules Rimet in 1904 to standardize the game throughout the world.

The amateur athletic club in the early to mid-nineteenth century was a sporting society where

upper- and middle-class men continued to play sports and compete after graduating from school or university. This type of club began to give way in the 1850s and 1860s to club teams owned by industrialists who staffed their teams with workers from the factories. As competition for players and victories began to grow, some of these teams began to pay wages to players derived from tickets sold to the public to watch matches. Increasingly, athletic prowess was an incentive to the working class: to earn better wages through one's sporting skills rather than through factory work was a means of economic and thus social elevation. With the influx of working-class players and spectators, many elites abandoned these games in favor of other sports, such as polo, that maintain a class barrier.

The mainstay in American professional sports during this era was baseball, a cousin of cricket and rounders that evolved in the early nineteenth century. The National Association of Baseball Players was founded in 1858 and codified the game's rules; however, this was an amateur group. The first professional salaried baseball team was the 1869 Cincinnati Red Stockings. Basketball was another homegrown sport in the United States, invented in 1891 by James Naismith at the Young Men's Christian Academy (YMCA) in Springfield, Massachusetts. Because it was played indoors and was inexpensive, basketball grew quickly in popularity not only in the United States but also in Europe. The first professional basketball game in the United States was played during the 1896–1897 season by the Trenton Basketball Team of Trenton, New Jersey, while in Europe the game was taking root as early as 1894.

By 1914 many team sports, both of European and American origin, fielded professional teams that paid players some form of salary. However, it would not be until the post-1919 period, with its specialty sporting press, that professional sport would evolve into one of the largest leisure activities of the masses.

Sports and Imperialism— British Sports in Asia, Africa, and the West Indies

The British sports that evolved between 1750 and 1914 included individual sports such as horse racing, boxing, tennis, and golf, and team sports such as rugby, association football (or soccer), cricket, and polo. During this period, sports underwent modernization, professionalization, organization, and codification. This revolution in sports originated in Great Britain during the mid-nineteenth century and served to create the modern structures of today's games.

Although each sport has its own particular evolution, the origins of many modern team sports are traceable to the British public school system of the nineteenth century, which were in fact private schools that charged tuition to its pupils. It was within these structures that young boys enjoyed regular recreation time in which they participated in athletic exercise. It was felt

Indian cricket team during a tour of England, 1886. (Bob Thomas/Popperfoto/Getty Images)

POLO

Polo is a sport played on horseback in which competing teams seek to score goals by driving a hard ball into the opposing team's goal with the use of a mallet. The equipment and horses needed to play polo were—and remain—expensive; therefore, historically polo was a sport of the wealthy.

The origins of polo are unknown, but many believe that it derives from an old Indo-Persian game designed to train cavalry. Although polo was practiced within India during the seventeenth century, it was not until the mid-nineteenth century that British administrators in India, observing the game played by Indian princes, began to play the sport with great enthusiasm and drew up a set of rules. Thus, it was in India, the crown jewel of the British Empire, where polo first developed a large following. By the 1870s and 1880s it was a primary focus within Indian society and was viewed by the British as a good means of interaction between the elites of both sides. Indian elites also took pride in polo as a traditional sport that distinguished them from their British rulers. Polo spread in popularity outside of India to England, Argentina, Ireland, and the United States and became an Olympic sport in 1900.

—*Lindsay Krasnoff*

that team sports encouraged certain characteristics or traits that were deemed essential in the ideal British subject: an ethic of fair play, a sense of teamwork, democracy on the playing field, submission to adult authority, and the adherence to a regulated set of rules. Two of the earliest team sports nurtured in this environment were soccer and rugby, originating out of the Rugby School run by Thomas Arnold, who is often credited as the father of the modern forms of these games.

Team sports were initially domains of the British elites and middle classes, whose sons mingled at public school and university and continued to play their games after graduation. As the nineteenth century progressed and sports became professionalized in the 1860s, some sports became increasingly the domain of the working class within the British mainland. Although some sports such as soccer were abandoned by the

elites as more commoners began to take the field, the initial impetus behind backing a sporting culture—that is, the instillation of what was deemed a proper British moral code via sport—became stronger, especially vis-à-vis the British Empire. British authorities found in sport an excellent opportunity to create a stronger link within the empire and to impart and reinforce British conduct and ideals to colonial populations.

From the mid-nineteenth century through the early twentieth century, Britain encouraged a program of sports imperialism that sought to infuse British behavior and ideals into the indigenous elites. Throughout the empire, sons of the native elites were sent to Britain to attend university, where they picked up different team sports and brought them back to the colonies afterward. Another way that the British colonized via sports was through British workers who left the home isles for jobs within the empire or on the continent to build bridges, railroads, and roads. These workers sought to play the games they had played at school and thus taught the locals the games developed within the British public schools and universities. In this way the British spread soccer widely during the Victorian and Edwardian eras, and by 1900 it was the most popular British sport played abroad. The other main way that the British used sport to colonize the empire was through playing games with the indigenous elites. It was not uncommon for British administrators to engage in sports against a local side. Through this contact the native ruling elites intermingled with the British and thus forged bonds to help govern the empire.

British sports such as soccer, rugby, and especially cricket served the empire as a unifying link that transcended culture and place. Not only did sport serve to tie the colonies to the home isles, but it also served as an intercolonial link to aid in creating a tie among different parts of the empire. To this end, colonial teams competed against each other in addition to British teams. In fact, sport could be said to be one of the most successful British exports during this time. Cricket became popular in Australia, South Africa, India, and the West Indies, with Australia and South Africa joining England as the original three founders of the International Cricket Council in 1909.

Sport was seen not only as a way to create British nationalism through a shared set of ideals and behaviors throughout the empire but also as a way to assert British gender norms. Sports, especially team sports such as rugby that involved aggression, were seen as enabling participants to assert their masculinity, a masculinity shared by all men within the empire who played the same games and a masculinity that set them apart from other powers.

Some parts of the British Empire were keen to adapt to the new sports, while others developed more distinct games. For example, British rugby became quite popular in South Africa and New Zealand, where oftentimes they were enjoyed by larger cross-sections of the populations than in Britain itself. British football, however, took a different turn in Australia, where it developed into

Aussie Rules football. By the eve of World War I, British sports dominated most reaches of the globe, the legacy of which carries through to the modern day, where a British team sport, soccer, is the most popular sport on the global level.

■ Introduction: Cross-Cultural Encounters

The growth of international trade, increasing levels of migration, the emergence of tourism, opportunities for cheaper and faster travel, heightened missionary activities, and conquests by China in the 1700s and Russia and the European states in the 1800s all ensured that the number and intensity of encounters among the world’s peoples increased dramatically between 1750 and 1914. The cultural ramifications of these encounters were far-reaching and profound. They also were one-sided. Although they are often described in terms of “exchange” or “interchange,” neither term is accurate when applied to the cultural encounters of the 1800s. Both words imply acts of reciprocal giving and receiving between two more or less equal entities. No such balance characterized the cultural interactions of the nineteenth century. Although examples of Western cultural influence on Asia, Africa, and Oceania abound, there were relatively few signs of Western cultural borrowing from Asian and African societies.

Throughout the early modern era, Africans and Asians who interacted with Westerners conceded that Europeans had impressive expertise

in mathematics, science, and technology, especially in the area of weapons design and manufacture. Thus, Chinese emperors beginning in the late sixteenth century supported the presence of European Jesuits at the imperial court because of what they could teach the Chinese about instrument making, cartography, mathematics, and weaponry. Indian, Persian, and even Ottoman rulers hired Europeans to upgrade their arsenals and teach their armies the latest European training methods and tactics. A number of Asian rulers also were impressed by European painting techniques and ordered their court painters to imitate the Europeans’ use of color and single-point perspective. This includes Mughal emperor Jahangir (r. 1605–1622) and a series of Chinese emperors, who hired dozens of European painters who passed on some of their painting techniques to Chinese court painters. But Asians and Africans showed little interest in other aspects of Western culture, which for many of them was represented by the boorish behavior of aggressive merchants and unruly sailors.

This changed dramatically in the nineteenth century, when industrialization, political

revolution, scientific progress, and an outburst of technological innovation transformed the Western nations into the world's dominant economic and political force. In India and other African and Asian colonies, imperialism opened the way for increased missionary activity; turned English, French, or Dutch into the language of government; and introduced Western legal concepts, medicine, and schools. Even in British colonies, which relied heavily on indigenous rulers to implement government policies at the village level, the standing of traditional elites was undermined.

The two dominant colonial powers, France and Great Britain, made efforts to produce small numbers of “assimilated” Westernized natives who would be receptive to Western rule and could serve as colonial administrators, teachers, and medics. When the British politician and historian Thomas Macaulay issued his famous memorandum on Indian education in 1835, he stated that the purpose of the European-style, English-language-based curriculum he proposed was to create “a class of persons Indian in blood and colour, but English in taste, in morals, in opinions, and in intellect.” The French goal was to produce *évolués* (“evolved ones” or “developed ones”), Africans and Asians who had “evolved” by shedding their native identities and accepting European values and behavior patterns. Such individuals, many of whom had studied or traveled in Europe, spoke French, were comfortable with French rule, worked for French firms or in the colonial administration, and usually lived in cities. They were the desired end product of France’s assimilation policy, which looked forward to the day when its Europeanized colonial subjects would become full French citizens, with political rights and duties no different from a Frenchman who lived in Paris, Lyons, or Marseille.

The reaction to Western ascendancy in those areas of Asia and Africa that remained politically independent varied greatly. On one extreme was Meiji Japan, where in 1868 the emperor issued the so-called Charter Oath, promising that “Evil customs of the past shall be broken off” and that “Knowledge shall be sought throughout the world.” This set the stage for three decades of social, political, and

educational reform modeled on the West. Viewing Westernization as a patriotic duty, Japanese adopted Western dress and grooming habits, learned to play baseball and enjoy European classical music, took ballroom dancing lessons, and took up Western practices such as teeth brushing and handshaking. Meanwhile, the government sent students to study abroad and imported hundreds of Western experts to modernize the military, revamp law codes, teach science, and restructure the educational system. In contrast, China’s advocates of self-strengthening resisted wholesale Westernization and clung to the idea that they could save traditional Confucian culture by adopting Western technology and nothing else. Nonetheless, missionary schools, increased contacts with Westerners in treaty ports, and contacts with members of overseas Chinese communities guaranteed that Western ideas would spread. These ideas inspired the flurry of reforms undertaken by the Qing government in the early 1900s, but they also inspired the revolutionaries who overthrew the Qing regime in 1911–1912.

The experiences of the Ottoman empire and Persia fell between those of Japan and China. In both regions, contacts with Western ideas through travel, missionary schools, commerce, and diplomacy (the Ottoman empire allied with Britain and France in the Crimean War) created a small but growing number of city-based individuals whose tastes, attire, knowledge of European languages, and secularism set them apart from the vast majority of their countrymen. Such contacts also convinced rulers and intellectuals of the need to introduce Western science and certain Western-inspired political reforms, but their efforts were frustrated by the lack of money and an undercurrent of religious opposition to all things Western and Christian.

Western views of Asia and Africa also changed. In the eighteenth century, writers such as Voltaire (1694–1778) contrasted the secularism, enlightened rule, and tolerance of China with the inept governments, religious bigotry, and constant warfare that plagued Europe. Wealthy consumers paid for high-priced Chinese porcelains even after Europeans discovered in the early 1700s how to make a porcelain that rivaled what the Chinese had been producing

for centuries. The artistic movement chinoiserie peaked in the mid-eighteenth century, when European painters, furniture makers, interior decorators, architects, and garden designers were influenced by Chinese models. In the late eighteenth and early nineteenth centuries, British Orientalist scholars learned Sanskrit and studied ancient Indian religious writings, convinced that they had discovered a civilization that rivaled that of ancient Greece.

In nineteenth-century Europe small numbers of painters, composers, and designers drew inspiration from non-Western art and music, especially toward the century's end. Beginning in the 1860s Japanese woodblock prints inspired many impressionist painters in France. The Czech composer Antonín Dvořák incorporated Native American and African American motifs into his orchestral and chamber music after residing in the United States for three years in the 1890s. Between 1907 and 1909 the paintings of Pablo Picasso were influenced by African sculpture, and Paul Gauguin, who lived out his last years in the South Pacific, incorporated elements of "primitive" Polynesian art into his paintings. In other areas of thought and culture, however, nineteenth-century Europeans were convinced that they had little to learn from Asians and Africans. Macaulay in his "Minute on Education" reflected educated European opinion when he wrote that "A single shelf of a good European library is worth the whole native literature of India and Arabia," adding that such literature contained "medical doctrines, which would disgrace an English farrier, [and] Astronomy, which would move laughter in girls at an English boarding school." Among nineteenth-century Europeans, there was no movement to study non-Western languages, no urge to adopt non-Western dress, and no impulse to remodel their schools, political institutions, marriage customs, or anything of significance based on the practices of India, China, or any other non-Western region. Instead, the practices and beliefs of people in the rest of the world came to symbolize superstition, backwardness, and stagnation, a characterization that reinforced the Westerners' sense of superiority and underscored the need for their "civilizing mission."

—James H. Overfield

African Influences on European Culture, circa 1900

In the eighteenth and early nineteenth centuries Africa was the source of people sustaining the profitable Atlantic slave trade. By the late nineteenth century, driven by the need to locate raw materials to feed their manufacturing industries, Britain, France, Germany, and Belgium had colonized sub-Saharan Africa. Encounters with African peoples were documented by missionaries, explorers, and administrators, and evidence of their contact with African culture was confirmed by artifacts acquired through trade or plunder. These objects eventually influenced the modernist art movement.

Initially, African artifacts were not considered to be art but anthropological material culture, and by the beginning of the twentieth century, ethnographic museums in major European cities housed extensive collections of objects from Africa. Ironically, the forced removal of African art objects from their continent of origin resulted in their preservation in Western museums. Had the objects remained in Africa, insects and climate probably would have destroyed them.

Masks and wood carvings of figures dominated museum display. They exhibited formal sculptural properties but diverged radically from prevailing Western concepts of art. Not only did they offer no evidence of naturalism, but they seemed to confirm the premises of social Darwinism, allowing Europeans to assert that they were civilized while Africans were unsophisticated primitives who created heathen ritual objects.

In the first decade of the twentieth century, avant-garde artists in France and Germany who were trying to define new ways of representing their changing world had lost faith in the capacity of naturalism to convey new ideas. They were intrigued by the ingenious use of materials and powerful presence, or inner force, apparent in carvings by the peoples of Africa and Oceania. French and German artists studied Western and Central African tribal art to learn how the sculptors used form and space (relationships between volumes, rhythms, and surface decoration). They were less interested in African cultural values and their visual embodiment because they

➤ AFRICAN INFLUENCES ON EUROPEAN CULTURE

Fang culture Ngil mask, wood and distemper, nineteenth century. This is similar to the mask seen in the 1912 photograph of Andre Derain's Paris studio. (Bildarchiv Preussischer Kulturbesitz/Art Resource, NY)

Stories about the discovery of African art cannot be confirmed. Vlaminck claimed to have discovered African art in 1905. In the autumn of 1906 he acquired a mask that he sold to Derain, who showed it to Matisse and Picasso. It was probably a Fang mask from France's colony in the Congo. Extant photographs of Derain's studio, circa 1912, show a Fang mask on the wall amid other masks and statues. Fang face masks are highly simplified, with a symmetrical alignment of minimalist features. Many of them carry scarification marks, something that is discernible in Picasso's painting, *Les Femmes d'Alger* (1907).

—Marion Arnold

knew little of African social organization and religion, but they imagined that African carvings, because they were simplified, were authentic expressions of ritual practices and simple or primitive lifestyles lived close to nature.

African art exerted a strong influence on artistic movements such as the French Fauves and cubists and the German expressionists. By 1906 Maurice Vlaminck, Henri Matisse, and André Derain were collecting African art in Paris, and in Germany the Brücke artists, Ernst Ludwig Kirchner and Erich Heckel, were studying primitive art. These artists were attracted by the freedom with which the human face and body could be manipulated through distortion, exaggeration, and geometric simplification. They realized that stylization and abstract pattern might express

the essence of the human condition. African art language offered Western artists ways of freeing themselves from the objective of imitating life in painting and sculpture. Their work became less descriptive and more concerned with ideas rather than appearances. The expressive power of form and decoration that characterized much of the African art helped Western artists to confirm the theories they were constructing about the aesthetic role of visual language in modernist theory.

Chinoiserie

Chinoiserie was a style or fashion in European art and architecture that grew out of the vastly increased contact and trade with China after 1600. The term, coined in eighteenth-century France, usually applies to the decorative arts and carries connotations of fad, fashion, and frivolity, but it was a major instance of long-distance trade and cultural borrowing in the early stages of Europe's worldwide maritime expansion.

Art historians have been quick to point out that the vogue for Chinese motifs and materials, especially porcelain and lacquerware, did not significantly affect the development of high art in Europe. This is true, but it ignores the impact that Chinese-inspired styles had on luxury items and eventually on everyday goods used first by the European aristocracy and then by the middle classes. It also neglects the enormous impact that these goods had on European perceptions of China and the exotic "other."

In terms of economic value and widespread appeal, Chinese porcelain, named china in England, led the chinoiserie fad. Since the Middle

➤ AUGUSTUS THE STRONG'S QUEST FOR TRUE PORCELAIN

In early-seventeenth-century Europe, Augustus the Strong was more than a bit player in the game of European power politics. As elector of Saxony and king of Poland, he ruled one of the wealthiest and most powerful states of central Europe. But he had a serious problem: his obsession with collecting imported Chinese porcelain threatened to bankrupt his state. His ministers were so concerned that they saw only two solutions to this impending financial crisis: they had to find an alchemist who could change lead into gold to finance these expensive imports or discover how to make the porcelain.

For over 100 years Europeans had been trying to discover the secret of this remarkable ceramic with its hard, smooth surface; painted designs under the glaze; and almost magical translucence. The Medici in Florence had produced a good-quality soft-paste glaze known as *faience*, and many kilns in Europe had been turning out this slightly inferior

product to meet the demand for a nonimported version of this expensive long-distance import.

But Augustus would have only the best. He found his alchemist, a Johann Bottger; locked him in a castle; and told him to produce or else. Amazingly Bottger did, by discovering the secret ingredient that had eluded all other Europeans. It was kaolin, a powdery mineral found near the famous Chinese imperial porcelain kilns at Jingdezhen but also widely available elsewhere if you knew what you were looking for. Combined with high-temperature firing, kaolin produced the long-sought-after true hard-glaze porcelain.

Augustus immediately set up a large ceramics works at Meissen, about 12 miles (19 kilometers) from his court in Dresden, and the European porcelain industry was born. Of course he tried to keep the technique a secret, but when two of his potters fled Saxony, the secret was out.

—Ralph Croizier

Ages this porcelain had been highly prized by the rich and powerful throughout Asia and into Europe. When expanded maritime trade made it more available, the European upper classes used a large portion of the silver from the Americas to finance its purchase. They also sought to discover the secret of its manufacture, finally succeeding in the early seventeenth century.

This development allowed Europeans to create their own porcelain kilns and produce their own designs, particularly in the decoration of vases, plates, small statues, decorative tiles, and, reflecting the enormous popularity of the Chinese beverage, tea, teapots and cups. These European adaptations were usually far more ornate and heavily decorated than their Chinese prototypes, particularly those reflecting the taste of the Chinese scholarly class. As ceramics and as wares in other fields, they should be seen not as imperfect imitations of Chinese style but rather as a creative response to external stimuli reflecting contemporary European needs and taste. The most famous European porcelain producers were located at Meissen and Nymphenburg in Germany, Delft in Holland, Sèvres in France, and Derby in England, but the taste

*Meissen sugar bowl from dinner set made for the Archbishop Elector Clement Augustus of Cologne, 1735.
(Francis G. Mayer/Corbis)*

for fine china and the vogue for chinoiserie extended all over Europe.

Textiles were another culturally and economically important part of chinoiserie. Imported silk went as far back as the Roman Empire, but in the seventeenth century cotton garments with Chinese designs, usually woven in India, spread widely, especially in England. In interior

decor, Chinese tapestries were used as fashionable wall hangings; wallpaper, another Chinese invention, became even more widespread. The furniture in these upper-class rooms consciously imitated Chinese taste in cabinets, tables, chairs, and screens. Often such items were coated with Chinese lacquer and decorated with imaginary Chinese scenes. In England, this was called Japanning, as different regions of the East were frequently confused.

There is also considerable semantic confusion about the Anglo-Chinese garden, a French term for a natural-looking asymmetrical design of parks for English country estates developed in the eighteenth century. Not much was known about Chinese gardens when these parks were first developed, and apart from a rejection of rigid geometrical design, they have very little in common with real Chinese gardens. However, the fondness for quasi-Chinese ornamental buildings, pavilions, and pagodas used to decorate these private parks did give them a certain Chinese quality. The most famous of these eighteenth-century follies is the still standing ten-story pagoda in the Royal Gardens at Kew.

By the nineteenth century the rage for Chinese-looking things was largely past, but the curious and exotic teacup images of a Chinese never-never land had a lingering influence on Western perceptions of the East.

Japonisme

The term “Japonisme” refers to the influence of Japanese art and design on the formative period of modern Western art, especially in France, during the second half of the nineteenth century. Japonisme should be distinguished from the concomitant rage for things Japanese—kimonos, furniture, ornaments, wall hangings, and cheap

tourist souvenirs—that swept across Europe and the United States following the opening of Japan in 1853. The name that the French applied to that more general phenomenon was “Japonaiserie.”

Japonaiserie was also a significant cross-cultural phenomenon, but Japonisme, the impact of Japanese colored woodblock prints on impressionist and postimpressionist artists, would have a much larger influence on the development of modern art. And since modern Western art spread worldwide in the twentieth century, it could be argued that these Japanese Ukiyoe prints of ordinary life in premodern Japan played a key role in the birth of modern world art.

Western art critics and historians have usually emphasized the internal cultural dynamics in the shift from Renaissance-style pictorial realism, or naturalism, that occurred after 1860 and led through impressionism, postimpressionism, cubism, and surrealism to a very different way of seeing and depicting the world. They point to the invention of photography making realistic representations less necessary, the accelerating pace of change in industrializing societies, and the search for novelty.

All of this is true. Change was in the air, and discovery of a sophisticated foreign art source was more a stimulus than a basic cause. The opening of Japan and the sudden appearance of a very different and very sophisticated visual culture enabled European painters, especially the Parisian avant-garde, to borrow new techniques and compositions and develop a new way of depicting the visual world.

The painters who absorbed this new Japanese view of art read like a Who's Who of early modernism: Paul Manet, Vincent Van Gogh, Edgar Degas, Paul Gauguin, Camille Pissaro, Henri Toulouse-Lautrec, and James McNeill Whistler. They all appreciated the flatness of Japanese art as a two-dimensional design and soon rejected the attempt to present the illusion of three-dimensional depth that had been central in European art since the Renaissance. In European art academies, methods to evoke depth had been codified into a strict set of rules about fixed point perspective, shading, and other compositional devices. In Japanese art, European avant-garde artists found new visual conventions: asymmetrical, decentered compositions with figures cut

➤ EDGAR DEGAS—JAPANESE INFLUENCE WITHOUT JAPANESE CONTENT

Cultural influence need not be obvious to be profound. On the surface, Edgar Degas is one of the least Japanese painters of his time. Manet, Van Gogh, Whistler, and even Monet all put Japanese objects in their paintings. Degas remained thoroughly French in his subject matter, but he was keenly interested in Japanese styles of composition and owned a large collection of Ukiyo-e prints by the foremost masters, including Hiroshige, Hokusai, and Utamaro. These prints very much influenced Degas's painting. Witness the typically French impressionist painting *Bains de Mer* (1867). There is nothing Japanese here except the basic way in which the picture is conceived and presented. The painting includes minimal modeling or shadowing of the figures, large flat patches of black resembling the geometric designs of a Ukiyo-e print, and an asymmetrical composition where figures and objects pull the viewer's eyes away from the center and off the edges of the picture frame.

This style was all new, all bold, all shocking to eyes used to conventional Western picture compo-

Edgar Degas, *Bains de Mer*, 1867. (National Gallery, London/Art Resource, NY)

sition. And it was a sure sign of the great sea change that was about to take place in Western art over the next 50 years. Would the change have happened without the contact with Japanese prints? Probably, but not in the exact way it did. By the 1860s, a shrinking globe was creating serious cross-currents and cross-fertilization in world art.

—Ralph Croizier

off or shown at unusual angles; bright flat colors; sharply outlined forms; and a fondness for scenes of ordinary urban life that went well with what middle-class Paris was becoming.

Although Paris was the center of Japonisme, as it was the center for European art in general, the vogue for Japanese styles spread to other countries, notably Britain, where the American-born James McNeill Whistler settled after a sojourn in Paris. Whistler is the artist most closely associated with Japonisme because of his frequent use of Japanese props and costume and at a deeper level because of his incorporation of Japanese sensibilities and compositional devices into his later work.

Japonisme also influenced the English pre-Raphaelite School with its aversion to mechanized, industrial society and became closely involved with the aesthetic movement in decoration and design. By the end of the century, these decorative elements fed into the rise of art nouveau. Another interesting legacy is Japonisme's tendency to anesthetize everyday life rather than

set art apart as something special, which had a strong impact on folk arts and crafts. This aesthetic carried into the twentieth century with the British potter Bernard Leach and his followers.

Twentieth-century modernists, notably the American architect Frank Lloyd Wright, found in Japanese art inspiration for a simplified and more natural aesthetic. In that sense the dialogue between Eastern and Western aesthetics continued long after Japonisme's defining moment of influence on the birth of modern Western painting, roughly between the 1860s and 1890s.

European Influence on Indian Painting, 1700–1900

With the slow deterioration of the Mughal Empire after the seventeenth century and the rise of British power in India, a gradual shift in artistic patronage and cultural prestige saw European-style art, including painting, eclipse all native Indian traditions.

In the sixteenth century, court artists had shown considerable interest and skill in incorporating European realistic techniques into mogul miniature painters. But this was voluntary cultural borrowing, very different from what came later as Britain established political control over the subcontinent. There was no systematic attempt by the British to teach European art to their Indian subjects before the 1850s, but company patronage for pictures of native flora and fauna done in realistic European style fostered a certain amount of artistic copying from the West. Combined with dependent Indian princes' desire to have European-style art to impress their British superiors, this led to a marked decline in native arts as Indian court artists picked up such realistic skills of post-Renaissance European art as fixed-point perspective, foreshortening, and chiaroscuro.

Concerned by the decline of economically important native arts and crafts by the mid-nineteenth century, the British established government art schools first in Madras and then in Calcutta (Kolkata) and Bombay (Mumbai). These were intended to promote native arts by introducing some European techniques, notably drawing skills. The schools had the unintended, but not entirely unwelcome, effect of training a new class of Westernized Indians who aspired to the social status of independent professionals as in modern Europe, not the craftsman position of artists in traditional India.

English was the language of instruction in art schools, and the schools supported and were supported by the growth of other modern art institutions such as art societies, museums, and exhibitions. The British authorities provided patronage in the form of awards and commissions, as did some of the native rulers, but it was the growth of the Westernized English-speaking middle classes that provided the necessary market for this new art and new type of artist.

Some of the notable academy-trained painters from this period were Pestoni Bomanji, Mahadev Dhurander, and Antonio Xavier Trinitade (born of mixed parentage in Goa), but by far the most famous Indian painter of the nineteenth century was Ravi Varma. Of aristocratic background in Kerala and mainly self-taught, he mastered the Victorian style of dramatic and sentimental figure painting to become a national celebrity.

Just as the creation of a new English-educated elite led to the rise of modern Indian nationalism by the end of the nineteenth century, the success in spreading European academic art led to a nationalistic reaction against this conservative establishment style. The focal point for this was Bengal, where in 1896 the pro-Indian art teacher E. V. Havell became head of the Calcutta art school. He discouraged formal academic training with its emphasis on copying and instead urged students to look to their Indian artistic traditions in order to develop their creative and spiritual powers.

This artistic message found resonance with young Bengalis, notably Abindrinath Tagore (nephew to the Nobel prize-winning poet Rabindrinath Tagore), whose 1905 painting *Bharat Mata* (Mother India) became an icon for the nationalist movement.

The politicized struggle between academic realism and Indian revivalism would become a major theme in twentieth-century Indian art, but it should be noted that this revivalism was also based on Western theories of art, notably the aesthetic movement and art nouveau at the end of the nineteenth century.

► RAVI VARMA—WESTERN-STYLE INDIAN SUBJECTS

Ravi Varma (1848–1906), the most famous artist of nineteenth-century India, was almost the perfect example of what Lord Macaulay was aiming for in his famous “Memo on Education in India” (1835): “a class of brown skinned Englishmen . . . English in manners, intellect, and style.”

Almost, but not quite, and that difference tells a lot about why Macaulay’s vision of the cultural as well as political absorption of India would go so far awry. Varma, a member of South Indian Brahmanic aristocracy from the kingdom of Travancore in what is now Kerala state, was brown enough and Indian enough. And he became the outstanding master of European-style oil painting in India, winning prizes as far afield as Vienna and Chicago as well as many honors from his British rulers.

Although exposed to European influences at the court in Travancore, he was a self-taught genius who, nevertheless, became a model for the professional artists who emerged from the British established art schools in India, the ones who both decorated the Raj’s monuments and inspired the new Westernized Indian middle classes. Varma was a master portrait painter, getting unprecedented prices for his commissions from the princes of native states, but it was his ambitious paintings of historical scenes from Hindu mythology that made him nationally famous. Thoroughly Western in style but completely Indian in content, they emulated the most prestigious genre of Western painting, historical scenes from antiquity.

Adept at the use of progressive technology, Varma and his brother set up a press to produce cheap reproductions to satisfy the enormous market for Hindu devotional pictures. These Westernized gods and goddesses are still the standard depictions in popular iconography.

So, had the English education succeeded in making brown-skinned Englishmen? The artistic language was English enough, but the content was

Ravi Varma, The Triumph of Indrajit, 1903. (Sri Jayachamarajendra Gallery, Mysore)

all Indian, or rather Hindu. This combination made Varma’s art popular in all regions of India, but in recalling ancient Vedic glories, it notably excluded Muslims and other minorities. Also, by its focus on the Hindu past, the content reaffirmed a traditional concept of Indian identity. As subsequent history showed, that Indian identity would not go away despite the attempts to modify and modernize through the Western education that Macaulay had advocated.

—Ralph Croizier

British Scholars and the Indian Renaissance

The collective response to British colonial penetration by Indian intellectuals, writers, and artists from the middle of the nineteenth century until independence in 1947 has become known as the Indian Renaissance, echoing the artistic

and intellectual flowering that occurred in Europe between the fourteenth and sixteenth centuries. By the turn of the nineteenth century, the presence of British merchants and their territorial ambitions had profoundly affected the Indian economy, political environment, society, and culture. Indians sought creative ways to

► ACADEMIC ASSOCIATION

One of the most important and influential Indian scholarly societies was the Academic Association, which started at the Hindu College at Calcutta (present-day Kolkata) in 1828. Some scholars see the Academic Association and its offshoot, the Society for the Acquisition of General Knowledge, as a microcosm of the larger process of Indian Renaissance. The young Indian intellectuals who comprised the Academic Association along with more peripheral figures called themselves Young Bengalis. Adherents and disciples of the British thinker and professor at the Hindu College, Henry Louis Vivian Derozio, these students were enamored with the ideas of free thought and relished the chances afforded them at the college and in the Academic Association to challenge traditional norms. They initially turned their attentions to a critique of Hinduism and the religious traditions of the Indian subcontinent, attempting to bring rationalist thinking to the study of religion. As time went on, however, the Academic Association and the Young Bengalis lost favor with many nationalists, who saw them as adhering too rigidly to the Western intellectual canon. Similar to the Indian Renaissance, the Academic Association utilized British scholars to contribute to an intellectual awakening in India but splintered under the demands of Indian nationalism.

—Brock Cutler

interact with the new political and social realities as the British used their technological and military advantage to penetrate ever farther into the subcontinent. This renaissance of Indian literature, art, and thought arose out of collaboration between Indians and their British intellectual counterparts: Indians were exposed to trends of thought from Britain while they were struggling to carve out a national identity. Thus, from the beginning the Indian Renaissance had to relate to and contend with British scholars and the views they represented.

Most scholars view the Indian Renaissance as a number of different intellectual and artistic movements in various geographic areas and languages, each one responding to the challenges of the others as well as British and other European movements (although the period is called

“Renaissance,” the most influential thinkers largely came from the European Enlightenment tradition). The Renaissance originated in Bengal, the first area confronted with an intensive British presence. Merchants and other Bengalis oriented their economy toward trade with the British, and new middle-class groups appeared that were confronted daily with the need to shape an identity distinct from the views they witnessed in British writings about their communities. As British scholars worked to define India’s history, they also set up Western-style schools and universities where they could both work with Indian intellectuals and provide Indians with a “modern” education. Writers such as Jeremy Bentham, Isaac Newton, Charles Darwin, and Thomas Paine were some of the most influential authors in these schools, and their work helped lay the foundation for Indian Renaissance thought. In the years before the 1857 Indian Rebellion, the relationship between Indians and British scholars was largely one of collaboration. However, after 1857 animosity between the two groups grew.

The rise and eventual wealth of the new Indian merchant and political classes—what some refer to as the birth of an Indian bourgeoisie—created a group of Indians willing and able to sponsor Indian scholars and artists as they experimented with new styles and modes of expression. This new artistic freedom allowed Indians to take a more active approach to questioning and reshaping their culture and history, providing impetus to combat British incursions and scholarship that sought to define culture and history in British terms. The literary and artistic innovations that came out of this confrontation were similar throughout the various Renaissance movements in India: religious reform, nationalism, secular questioning of tradition, and the return to vernacular or popular forms of language and expression. British scholars can therefore be seen as both catalysts and enemies of the Indian Renaissance: as Indians were exposed to British and other European forms of thought and culture, they were inspired to reinvent the cultural and intellectual vibrancy of Indian art and thought.

The cultural production of the Indian Renaissance quickly lent itself to nationalist move-

ments throughout the subcontinent. Many British scholars also advocated on behalf of the Indian nationalist movement, but for the most part the adherents of nationalism arose from the fertile ground laid by the intellectuals and artists of the Indian Renaissance. In order to challenge and confront British domination on the subcontinent, many thinkers developed a desire to confront and master the British tools of economic and technological change, such as the printing press and Western scientific methods. By the end of the First World War, British scholars were largely marginalized in India. The Indian Renaissance is traditionally understood to have ended with infighting among the nationalist factions struggling for the right to define what India would become.

The Japanese Cult of the West in the Meiji Period

Despite intense opposition to the influx of outsiders into Japan, Japanese leaders' desire to learn from the West became slowly popular in the late Tokugawa period. As people became aware of European colonial advances in India and China, the Tokugawa Bakufu (shogun's office) made a concerted effort to study the West. The Bakufu sought to grasp the secrets of European and American strength in order to protect the island nation from European imperialism.

Around 1811, Japan's fascination with the West resulted in the establishment of the first central institution for translation, study, and teaching of Western languages in Japan, the Bansho Shirabesho, or Institute for the Study of Barbarian Books. Navigation and gunnery were its principal interests, but the curriculum gradually enlarged to include various disciplines such as mathematics, physics, chemistry, and

mechanical engineering. Similar schools were soon established in all parts of Japan.

On the face of it, Commodore Matthew Perry's arrival in Japan with his Black Ships in 1853, and his demand that Japanese ports open to U.S. trade led to an increase in Japan's access to information about the West by broadening opportunities for study and travel. Therefore, in the 1860s a number of envoys were sent overseas, and students were dispatched to study navigation, shipbuilding, and other aspects of technology that would directly contribute to national strength. But those subjects promptly broadened into various fields of Western knowledge such as philosophy, science, and religion.

During the Tokugawa period, Japan's primary purpose in sending students to study abroad was to find ways of protecting itself from European or American incursion. After the Meiji Restoration in 1868, students abroad found themselves more engaged with the nation-building and Westernization of the country. The number of students overseas had increased significantly; between 1871 and 1873, there were as many as 350 students studying abroad under Japanese-government sponsorship. About two-fifths were in the United States studying technology, mining, commerce and agriculture, and the rest were either in Britain focusing on engineering, industry, and trade; in France studying law; or in Germany concentrating on political science and medicine.

Of all the travelers to Europe or America, none took his task more seriously than Fukuzawa Yukichi. He epitomized the Japanese cult of the West in many ways. In 1860 he joined the first Japanese mission to America, and two years later he visited France, England, Holland, and several other European nations as a member of the first Japanese mission to Europe. The information collected during these journeys was turned into one of his most celebrated works, *Seiyo Jijo (Conditions in the West)*, published in three volumes in 1866, 1868, and 1870. This book, written in a clear, simple style, delivered concise accounts of everyday life and social institutions in the West, such as hospitals, schools, newspapers, and museums.

However, the most important venture to the West was the Iwakura Mission. The Iwakura

➤ FUKUZAWA YUKICHI AND THE CULT OF THE WEST

Fukuzawa Yukichi (1835–1901) was a prominent educator, writer, and propagator of Western knowledge. Born into an impoverished low-ranking samurai family, Fukuzawa was unable to fully employ his talents in the traditional Japanese society. He eagerly studied Dutch and Western science in Nagasaki and Osaka, which helped him actively engage in foreign trading.

After Japan's opening of her ports, Fukuzawa began to learn English and was sent to America and several European nations as an envoy. Especially with the publication of his famous book *Seiyo Jijo* (*The Situation in Western Countries*, 1866–1870), Fukuzawa became known as an authority on the West. The book came out at a time when many Japanese began to turn their attention to Western knowledge and technology. Believing that Westernization would advance the independence of Japan, he devoted his life to educating his countrymen to Western thought. His

passion for public education was reflected in a series of pamphlets titled *Gakumon no Susume* (*The Encouragement of Learning*, 17 volumes, 1872–1876). These texts begin with the assertion that “heaven does not create one man above or below another man. This means that when men are born they are by nature equal,” pointing out the importance of the principle of equality of opportunity.

In 1875 while the *Gakumon no Susume* pamphlets were still appearing, Fukuzawa wrote a more complex work, *Bunmeiron no Gairyaku* (*An Outline of a Theory of Civilization*, 1875). In it he argues that civilization is relative and comparative according to time and circumstance and that Japan is at a crossroads between advancing forward into modern civilization and falling into barbarism. It was at this time that the enthusiasm for the Western learning reached its peak in Meiji Japan.

—Inhye Kang

Mission was an 18-month stay in the United States and Europe between 1871 and 1873 intended both to raise Japan's international prestige and to closely examine Western societies for their sources of wealth and power. The idea was put forward by Iwakura Tomomi, and the mission set out in 1871 from Yokohama, bound for San Francisco. From there, the ambassadors visited Britain, France, Belgium, the Netherlands, Russia, Prussia, Germany, Denmark, Sweden, Austria, Italy, and Switzerland and finally returned home on September 13, 1873. A body of facts and opinion collected during this mission was published as a five-volume report in 1878. The mission, therefore, embodied the Japanese diplomatic endeavor to secure Japan's international stature through direct experience of the West.

Most of the envoys and students sent abroad before the Meiji Restoration came back not only with information on Western technology and culture but also with the enthusiasm for the West. Their firsthand exposure led many who became Meiji leaders to believe that economic strength and civilization were the sources of European national power. In contrast to the Tokugawa shogun's reserved attitude toward the

West, the Meiji government was characterized by its aggressive borrowing from the West. The Meiji government, under the slogan of “Civilization and Enlightenment” (*bunmei kaika*), vigorously adopted a modern social system from the West both to abolish the feudal socioeconomic system and to build a “rich country and strong army” (*fukoku koyobei*). Accordingly, Westernization of customs and everyday life was heavily encouraged, including practices such as wearing Western clothes and eating Western foods. The government also adopted the Gregorian calendar, implemented telegraph and postal services, and started constructing a modern transportation system. The adoption of Western civilization so extremely engulfed 1870s Japan that many Japanese started to regard its own tradition as antiquated and equated “Civilization and Enlightenment” with the imitation of all things Western.

In addition to studying and traveling abroad, a growing range of translations, books, and newspapers about the West also contributed to the Japanese craving for the West. Two vehicles of Westernization were the society Meirokusha (Meiji 6 Society) and the journal *Meiroke Zasshi*, appearing in 1874–1875. The society was founded

by Japan's leading intellectuals and played a prominent role in introducing and popularizing Western ideas during the early Meiji period with the journal and a series of public lectures.

Moreover, a number of translations of Western works fulfilled the Japanese appetite for the West. In 1871 Nakamura Masanao translated both Samuel Smiles's *Self-Help* and John Stuart Mill's *On Liberty*. Other works, such as *Robinson Crusoe*, *Aesop's Fables*, *The Arabian Nights*, and Rousseau's *Social Contract* were also translated in the Meiji period. The production of such translations enabled the emergence of straightforward prose in Japan and a new interest in the individual as subject.

By the 1880s, many Japanese had traveled to Europe and America and recognized the problems faced by those societies, often the aftermath of rapid industrialization and the stresses of international competition. The wave of enthusiasm for the West abated, and a more skeptical approach to Western civilization emerged. This realization inspired a resurgence of pride in Japanese culture and tradition during the 1880s and 1890s.

The Beginnings of Jazz in America

Jazz is a musical style that emerged during the last decades of the nineteenth century. While musical innovations took place in a number of places in the United States, most early jazz

musicians were African Americans from the South. In particular, a significant number of the music's primary innovators such as Buddy Bolden, Jelly Roll Morton, Bunk Johnson, Kid Ory, Sidney Bechet, King Oliver, and Louis Armstrong were born and raised in New Orleans and its environs. Nineteenth-century New Orleans was a cosmopolitan city unlike any other in the United States, combining French, Spanish, Caribbean, and Anglo influences coupled with a nuanced and stratified attitude toward race that created a social space for free blacks and mixed-race individuals (the so-called creoles of color).

The musicians who created jazz developed an approach to music making that combined European instruments, harmony, and song forms with African ways of music making: call and response, polyrhythms, syncopation, improvisation, and voicelike instrumental techniques (growls, smears, pitch bends, fake fingers, etc.). These ideas were then applied to the popular music of late-nineteenth-century America: minstrel songs, military marches, ragtime, blues, spirituals, parlor songs, ballads, opera, and Caribbean music. Improvising on these musical styles, African American and creole musicians added syncopation and a swinging beat, creating the slow drag and up-tempo strut that would form the backbone of most popular New Orleans musical styles.

The instrumentation of early jazz ensembles grew out of brass bands, many of whose members had access to a musical education and could read music, and string bands (typically including bass, guitar, mandolin, and violin, with an added cornet or clarinet). New Orleans society dance bands drew on both types of ensembles, eventually coalescing into the classic small jazz ensemble of cornet, clarinet, trombone, tuba, banjo, piano, bass or tuba, and drums. These groups developed a style that moved away from controlled ensemble playing typical of ragtime toward a looser style exemplified by polyphonic (and polyrhythmic) collective improvisation, especially among the frontline horns (cornet, clarinet, and trombone). Solo improvisations were featured, but these were often worked out ahead of time and were usually confined to variations on the extant melodic material rather than the type of free harmonic creation developed by Louis Armstrong and others in the 1920s.

► CHARLES “BUDDY” BOLDEN

The life of cornetist Buddy Bolden (1877–1931), reputed to be the first great jazz soloist, is surrounded by mystery, in part because little was written about him during his lifetime and no recordings exist of his playing (though he is rumored to have made at least one that is now lost). But as researchers began compiling early oral histories of jazz in the 1930s, Bolden’s name came up repeatedly, accompanied by a number of narratives of dubious origin: that Bolden played so loud that his trumpet could be heard for miles, that he edited a scandal sheet known as the *Cricket*, and that he was the proprietor of a barbershop. While these stories would later prove to be false, many were propagated for years by writers relying on faulty or manufactured accounts rather than primary sources.

What is known is that Buddy Bolden was born and raised by a single mother in New Orleans. He began playing cornet as a boy and by his teens was playing professionally. Reliable accounts by his contemporaries attest to his powerful, flexible sound; his rhythmic drive; and an improvisational style that utilized flattened blue notes and vocal-like effects. Bolden is often credited with establishing the instrumental lineup for the classic New Orleans sound: cornet, clarinet, trombone, and rhythm section. In the end, Bolden’s career was cut short by mental problems exacerbated by acute alcoholism, resulting in his commitment to the Jackson State Mental Hospital in 1907, where he remained until his death in 1931.

—Andrew Connell

Bands played primarily for dancing, often advertising their appearances by parading through the surrounding neighborhoods in the back of a truck to promote an upcoming show. Often competing groups, upon meeting in the street, would engage in impromptu musical battles. These bands performed in riverfront taverns, saloons, gambling dens, and houses of prostitution, while some bandleaders, such as Kid Ory, rented out dance halls. Recompense was minimal, and the majority of African American and creole musicians of the time worked in other professions, unable to support themselves solely on music. For example, the creole clarinetist Alphonse

Picou worked as a tinsmith and a plumber, while cornetist Pops Foster was a longshoreman. In addition, with few exceptions bands were strictly segregated, as were the performance venues.

In the early decades of the twentieth century, many of these musicians joined the great migration of southern blacks northward, finding greater economic opportunities in Chicago, New York, and California. The cornetist Joe “King” Oliver found lucrative work with his Creole Jazz band in Chicago, bringing with him his young protégé Louis Armstrong, who by 1925 had emerged as the greatest soloist of the early jazz era. Armstrong’s series for the Okeh label, known collectively as recordings of the Hot fives and Hot sevens, would revolutionize jazz performance practice. Made with collaborators such as the pianist Earl Hines and clarinetist Johnny Dodds, these records presented a new level of instrumental virtuosity and flexible ensemble interaction, especially within the rhythm section, and Armstrong’s harmonically based improvisations transformed jazz from a collective to a soloist’s art form, a model that most jazz musicians have followed ever since.

The French School of the Far East

Since its birth in the years after the French colonization of Indochina, the French School of the Far East (École Française d’Extrême-Orient, or EFEO) has been an important institution for the creation and dissemination of knowledge about Asia. The EFEO is an educational institution in France operated by the national Ministry of Education. The chief aims of the school were and still are the study of archaeology, anthropology,

➤ ANGKOR WAT

The Cambodian national flag has changed numerous times over the years, but many of its permutations include the depiction of a walled structure directly in the middle: the main temple at Angkor Wat, one of the oldest existing Buddhist and Hindu temples in Cambodia and the largest religious structure in the world. Built by Suryavarman II in the twelfth century, Angkor Wat was built as a Hindu temple and later converted to Buddhist use. Symbols of national unity, the temple and the site around it were the domains of the *École Française d'Extrême-Orient* (EFEO) Cambodian branch from the first years of the twentieth century until 1972. During these years the EFEO uncovered and restored much of the ancient city of Angkor and also established Angkor Wat as one of the principal religious sites in East Asia. Despite the political upheavals throughout the region, the scholars at Angkor worked diligently to protect the magnificent site from destruction.

history, art, and languages of mainly East and Southeast Asia. The school has been both a place of cultural exchange and mutual sharing and also a symbol of the French colonial endeavor and the imperial implications of Orientalist study. This dual interpretation has existed since the school's inception and has survived through colonial wars, the end of the French administrative presence in the region, and the rise of independent states.

French Orientalists (scholars of non-European cultures and languages) had wanted for some time to create a school in Asia as a sister to their schools in Athens (1846) and Rome (1875). After attempts to establish a center for study in India proved fruitless, they turned their attention to the recently conquered areas of Indochina. The governor-general of Indochina,

Paul Doumer, used his influence to establish the *Mission Archéologique d'Indochine* at Saigon in 1898, and in 1901 the institution was moved into a new building in Hanoi and given the new title *École Française d'Extrême-Orient*. (The school was moved from Vietnam in 1957 and now operates in multiple smaller centers throughout the region.) This new body was designed to be regional in scope and to undertake the systematic study of Southeast Asia in order to further both general understanding of the region and French colonial interests. Many of the early specialists at the school were Indianists or Sinologists, and a number of them served as colonial administrators during or after their time at the school.

The first conference held at the new EFEO building in Hanoi occurred in 1902 and, with the participation of experts from France, Germany,

Britain, and Italy as well as the Netherlands Indies, Siam (Thailand), and Japan, was a good representation of the cross-cultural and political nature of the institute. The success of this conference—the Congrès International des Études d'Extrême-Orient—initiated a series of exchanges among the academic and policy experts of the participating countries, leading to the sharing of both scholarly knowledge and solutions to common colonial policy problems.

This level of collaboration was important not only for the advancement of scholarship and knowledge of the traditions and cultures of Asia but also for bringing together French and Asian intellectuals with their colonial administrative counterparts. These collaborative meetings meant that scholarly work had a direct effect on government policy and social movements in the colonial period. Not only did governments and administrators gain from this sharing, but insurrectionary and nationalist leaders used the scholarship to lend credence to their movements. Far from being merely a haven for colonial thought, the school also attracted many of the brightest Indochinese intellectuals, who used archaeological and linguistic discoveries to strengthen their arguments for the fundamental existence and solvency of a national culture.

The EFEO was a pioneering institute of scholarship and study in French-dominated East Asia. This Orientalist scholarship contributed not only to the body of knowledge about East Asian societies and cultures through the ages but also to the creation of policies and methods of governing the colonial holdings of Europeans in Asia. The school can also be credited with protecting the cultural patrimony of cultures throughout Asia, as specialists uncovered and helped preserve many archaeological sites now deemed national monuments. While some viewed these archaeological excursions as a form of cultural imperialism, without the actions of the EFEO many of today's most treasured national sites may have disappeared altogether.

■ Introduction: The Birth of Modernism in Europe, 1880–1914

The term "modernism" encompasses a diversity of artistic and cultural movements that erupted across Europe and the United States during the period from 1890 to 1930. Critics and historians disagree over the exact beginning and ending dates of modernism, but most see its origins in France in the late 1860s and 1870s in the impressionist paintings of Édouard Manet (1832–1883), the symbolist poetry of Charles Baudelaire (1821–1867), and the realist novels of Gustave Flaubert (1821–1880). Distinctly modernist music began somewhat later with the work of Gustav Mahler (1860–1911), Richard Strauss (1864–1949), and Claude Debussy (1862–1918). Modern architec-

ture came later still, around 1900, with the work of Louis Sullivan (1856–1924) and Frank Lloyd Wright (1867–1959) in the United States, Victor Horta (1867–1941) in Brussels, Antoni Gaudí (1852–1926) in Barcelona, Otto Wagner (1841–1918) in Vienna, and Charles Rennie Mackintosh (1868–1928) in Glasgow. In literature, the year 1922, during which T. S. Eliot's *The Waste Land* and James Joyce's *Ulysses* were published, is often viewed as the high point of the modernist movement.

As a collection of ideas and styles, modernism posited a break from the past but was rooted in tradition. Many modernists elicited new forms of expression (free verse in poetry and

abstraction in painting) and new ideas (primitivism) while depending on nineteenth-century Romanticism or Greek and Roman myths for points of reference. T. S. Eliot (1888–1965) found models for his inspiration in writers of the early seventeenth century, Robert Frost (1874–1963) studied Horace, and Ezra Pound (1885–1972) turned to ancient Japanese Noh drama and Chinese ideographs. Much modernist output (prose, poetry, painting, drama) arose from an anxiety to grapple with the complexity of mechanical and surreal urban life and its alienating effects. Victorian notions of truth and stability (already shaken by ideas from Darwin, Marx, Nietzsche, and Freud) were challenged.

Some modernists were self-consciously aware of their positions as vanguards of the “new” and wrote manifestos about their art, such as the Imagist poets led by Ezra Pound, whose claim “make it new” is seen as a rallying cry for new forms and ideas. The Futurists, who flourished in Italy in the early 1900s and influenced Futurist movements in Russia and England, issued dozens of manifestos on painting, sculpture, design, theater, film, fashion, textiles, literature, music, architecture, and even cooking. The Italian Futurist Filippo Tomaso Marinetti (1876–1944) worked with Christopher Richard Wynne Nevinson (1889–1946), a British painter, to produce the manifesto “Vital English Art: A Futurist Manifesto.” In relation to architecture, Louis Sullivan’s (1856–1924) statement that “form follows function” is both opaque and transparent, a paradox that represents modernism in many forms.

Visually “modern,” the skyscrapers of the late nineteenth century owed as much to engineering as to art, and the architecture behind them rejected historicism. Art Nouveau relied on steel and other metals for paradoxical primitivism. Indeed, modernist architecture embraced many of the same ideals as visual and literary modernism. For example, Frank Lloyd Wright (1869–1959) epitomized the trend to borrow cross-culturally in order to create a new blended style of architecture.

The other visual arts of sculpture and painting were similarly transformed by modernism. Movements of note include Fauvism (a short-lived movement characterized by strong color

and wild brush strokes), Cubism (in which painted objects are broken apart, analyzed, and then “reassembled” from different perspectives), Expressionism (in which artists attempted to depict emotions rather than physical realities), Dada (whose advocates prided themselves on their rejection of war, bourgeois culture, and most forms of art), Symbolism (which rejected naturalism and realism and sought to express ideas indirectly by imbuing objects and images with symbolic meaning), and Surrealism (which grew out of Dadaism and was particularly strong in Britain), to name a few. The Armory Show of 1939, which toured New York, Chicago, and Boston, included both U.S. and European artists and introduced avant-garde art to the United States. An international exhibition of surrealist painting in Britain in 1936 led to the publication of *The London Bulletin*, which included both art and literature.

After the 1930s, the term “modernist” was rarely applied to literary figures, but it continued to be used in connection with dance, music, and art. Although never without its share of critics, modernism’s rejection of tradition and its commitment to artistic freedom and experimentation have had a lasting impact on all aspects of Western and, to an extent, world culture.

Literary Symbolism

Symbolism originated as a literary movement in France and Belgium in the 1880s, arising from a desire for something beyond the real and the material. At its root lay a dissatisfaction with the ideas of progress espoused in the name of science, which the symbolists believed left little room for the presence of higher ideals. It was for this reason that they rejected naturalism, which sought to describe its subjects in realistic detail and often drew upon scientific theories of evolution and heredity to do so. Instead, symbolism had as its goal to suggest and evoke but never

Charles Baudelaire was the father of symbolist poetry and a highly respected critic of the French art and literary world during the nineteenth century. (Library of Congress)

describe. It eschewed mimetic descriptions in favor of evocations of sensations, spirituality, and interior thoughts and feelings.

Although Jean Moréas (1856–1910) codified the term “symbolism” to refer to the new poetry, this did not signal the beginning of the movement as much as it described what had already been taking place. The poet Charles Baudelaire (1821–1867) was widely acknowledged as a precursor to symbolism, for the themes of *Le spleen de Paris* (1869) and the ideal that structured his book of poetry, *Les Fleurs du mal* (1857), also interested the new generation of writers. Three of the most prominent symbolists—Stéphane Mallarmé (1842–1898), Paul Verlaine (1844–1896), and Arthur Rimbaud (1854–1891)—had all published collections of poetry by the time Moréas wrote his manifesto. In fact, the manifesto was largely a response to growing criticism of the new movement, derisively referred to as “decadent.” This impelled Moréas to propose the term “symbolism” in its place, although some, including Verlaine, continued to prefer the term “decadent.”

The criticism directed at symbolism posed logistical problems as well. Denied access to established periodicals, the new vanguard sought other means of defending themselves against

➤ JEAN MORÉAS’S “SYMBOLISM—A MANIFESTO”

The following is an excerpt from Jean Moréas’s “Symbolism—A Manifesto” published in 1886. Unlike most Symbolist writing of the time, which usually appeared in small, ephemeral publications, this manifesto was published in a major journal.

“The enemy of teaching, of declamation, of false sensibility, of objective description, Symbolist poetry seeks to clothe the Idea in a sensible form, which, nevertheless, would not be a goal in itself, but which, while serving to express the Idea, would remain subject to it. The Idea, in its turn, should not be seen as deprived of the sumptuous trappings of exterior analogies; for the essential

character of Symbolic art consists in never going as far as the conception of the Idea itself. Thus, in this art, scenes of nature, human actions, all the concrete phenomena cannot manifest themselves as such; they are sensible appearances destined to represent their esoteric affinities with primordial Ideas.”

—Isabel Suchanek

Source

Jean Moréas. “Le Symbolisme, Un Manifeste littéraire.” *Le Figaro, Supplement Littéraire*, Sept. 18, 1886, 150. Translated by Isabel Suchanek.

their critics and disseminating their ideas and works. To that end, many of them founded their own journals, and this period consequently witnessed an enormous outgrowth of journalistic activity. Many of these publications were ephemeral, lasting only one or two years, although some, such as *La Revue blanche* or *Le Mercure de France*, experienced greater longevity.

If symbolists rejected naturalism's objective descriptions, they also rejected the rigid rhyme schemes of their poetic predecessors, the Parnassians. The most pointed attack was against the alexandrine, a twelve-syllabic line of verse usually divided by pauses into equal halves or thirds, that formed the basis of much traditional French poetry. Seeking to infuse new life into a medium that they believed had become staid and conventional, the symbolists turned to lines of verse with odd numbers of syllables and irregularly spaced pauses. This also had the effect of enhancing the musicality of the poem, a central concern for many and deriving in part from their fascination with the German composer Richard Wagner.

This interest in Wagner also led symbolists to explore the idea of synesthesia, the interrelation of the different senses and, in their minds, often associated with a spiritual experience. Baudelaire had suggested as much in "Correspondences" (ca. 1852–1856) when he wrote that the sounds, smells, and colors responded to one another, a notion echoed by Rimbaud's "Vowels" (1871), which paired each vowel with a different color. Additionally, synesthetic theater was much in vogue at the end of the nineteenth century. One such production covered the floor in flowers and sprayed incense in the air while an organ played music by Erik Satie and trumpets sounded the prelude to the Wagner opera *Parsifal*.

Symbolism's rejection of the conventional, along with its emphasis on nuance and imprecision, led to formal innovations such as the development of *vers libre* (free verse) practiced by Gustave Kahn (1859–1936), among others. It was now the unity of form and idea that determined the individual verse as opposed to a given number of syllables or rhyme scheme. Mallarmé's poem "Un coup de dés jamais n'abolira le hasard" (A Throw of the Dice Will Never Abolish Chance) was also significant in this regard. In varying the

size and placement of the text, composing with the white of the page as much as the words themselves, Mallarmé created a work that was simultaneously visual and aural and that would prove enormously influential for both poetry and art in the years to come.

Impressionist Art and Music

Impression, Sunrise, Claude Monet's 1872 view of the harbor at Le Havre, marked a new way of seeing for artists. As if through a painted veil of atmosphere, Monet's scene, created by visible brushstrokes and dashes of color, was the catalyst for the term "impressionist" that came to define a style of painting that influenced modern art's dictum *l'art pour l'art* (art for art, a phrase coined by James MacNeill Whistler) and the music of composers such as Emmanuel Chabrier (1841–1894), Claude-Achille Debussy (1862–1918), and Maurice Ravel (1875–1937), among others.

Monet displayed his landmark work at the first impressionist exhibition in 1874, held at the studio of photographer Gaspard-Félix Tournachon, better known as Nadar. Celebrated for his aerial photographs of Paris, Nadar wished to elevate photography to an art form and contended that light and an appreciation for its effects required artistic intellect. That light was the crucial element in both photography and impressionist painting explains this first impressionist exhibition alliance. Impressionists'

Claude Monet, *Impression, Sunrise*, 1872. (Erich Lessing/Art Resource, NY)

desire to unite their style of painting with the contemporary world and its latest technologies was sanctioned by the writings of critic and poet Charles Baudelaire (1821–1867), who argued that modern life was the only viable subject for artists to undertake. Pierre-Auguste Renoir, Alfred Sisley, Berthe Morisot, Edgar Degas, Paul Cézanne, and Camille Pissaro were among the artists who also showed their works at Nadar's studio and who painted subjects as diverse as the ballet, new train stations, and the expansive avenues of Haussmann's renovated Paris as well as the French countryside.

Plein air painting, or painting in the out-of-doors, was common practice with many impressionist painters and especially with Monet, who mixed his paints directly in nature to assure spontaneity in his art. The importance of nature as a motif cannot be overstated in impressionist art and music. Evoking an immediate sensory response was of primary concern for the impressionists, as was their interest in light effects, in capturing fleeting moments of light and especially its delicate shimmers on fluid surfaces through the use of color. They celebrated color as fundamental to art and revered the works of Eugène Delacroix (1798–1863), whose loosely applied color was primary to the structure of his art. This diminished the importance of linear qualities and highly finished surfaces central to the practices of neoclassicists such as Jacques-Louis

David (1748–1825) and Jean-Auguste-Dominique Ingres (1780–1867). However, by the late 1880s the bold blocks of color that Paul Cézanne began to employ in his Provençal landscapes foreshadowed later concerns in art.

Impressionist music, too, sought to appeal directly to the senses by creating harmonies that often suggested an undefined, vaporous realm between dream and reality. Emmanuel Chabrier moved in impressionist circles and avidly collected impressionist paintings. He was the first composer to interpret impressionist ideas of color and light into music with *Pièces Pittoresques* for piano in 1882, a decade after *Impression, Sunrise*. Thus, impressionist music was infused with other artistic trends such as symbolism, realism, and the music of Richard Wagner. Chabrier's music influenced Claude Debussy, perhaps the best known of the impressionist composers, whose *Printemps* (Spring) of 1887 is seen as the first impressionist musical composition. Its evocation of nature, from the dawning of spring and the renewal of life, is heard from the light melody of its opening bars to the full-blown orchestral design of trumpet fanfares to the suppressed cymbal and harp in its closing. Debussy's musical layering can be seen as an equivalent to the multiple paint strokes of the impressionist canvas. Titles such as *Nocturnes* suggest his debt to Whistler's canvases, although Maurice Ravel's later *Nocturnes* pays homage to Debussy himself. *Prélude à l'Après-midi d'un Faune* (1894), Debussy's most important impressionist work and inspired by Mallarmé's poem of the same name, conjured the sensuousness of nature with a free flow of musical strains rather than a defined melody. Unlike Debussy's fluid melodies, Ravel's *Jeux d'Eau* maintains a defined musical line, showing his classical orientation while keeping the accompaniment lush and impressionistic.

Postimpressionism

The eighth and final French impressionist exhibition, featuring works by Camille Pissarro, Edgar Degas, Berthe Morisot and others, but nothing by Claude Monet or Auguste Renoir, was held in 1886. By that date a number of artists, including Monet and Renoir, were expressing dissatisfaction with the impressionist project of rendering ephemeral optical experiences pictorially. Personal friction among the original impressionists also contributed to the disintegration of the group. For the next 20 years progressive artists experimented with different forms of pictorial representation that, through form and subject matter, embodied a commitment to European modernity.

Postimpressionism was neither a structured art movement nor a term adopted by nineteenth-century artists. It was the label applied spontaneously in 1910 by English art critic Roger Fry to a collection of modern art from France. Asked to describe the artists whose work he had assembled for a London exhibition, Fry said that they came after the impressionists and added, “Let’s just call them postimpressionists.” Fry’s two postimpressionist exhibitions in 1910–1911 and 1912–1913 included work by deceased artists such as Vincent van Gogh (1853–1890), Paul Gauguin (1848–1903), and Paul Cézanne (1839–1906) as well as Henri Matisse (1869–1954) and Pablo Picasso (1881–1973), whose careers as radical modernists were then just beginning to acquire significance. Despite the fact that postimpressionism was originally used as a synonym for early modernist art that deviated from the principles of impressionism, the term is often applied in particular to four important painters working in France in the final decades of the nineteenth centuries: van Gogh, Georges Seurat, Gauguin, and Cézanne.

Viewing their work retrospectively, it is obvious that although they embraced impressionism for short periods, these painters subsequently developed highly personal ways of translating perceptions of reality into distinctive vocabularies that synthesized what was seen with what was known about form and space. Van Gogh, using saturated color and impasto brushstrokes (a technique in which paint is thickly laid on an

Georges Seurat, Bathers at Asnières, 1883. (Corel)

area of the surface or the entire canvas) to energize simplified shapes, allows his passionate, subjective feelings about people, landscapes, and objects to penetrate his subject matter. In this respect, he can be understood as a forerunner of expressionism since his style and method of painting and the angst in his subject matter influenced the twentieth-century German expressionists. Gauguin is often associated with the literary movement of symbolism. His most distinctive work was created in Brittany and the South Seas. He acknowledged the enigma of nature and the power of the imagination. Using pure nonnaturalistic color and flattened form, he suggests the invisible, symbolic connotations of nature. Seurat, familiar with the optical principles of prismatic color, added to impressionism a scientific rational structure. Seurat’s neo-impressionism, a systematic division of color and tone (or divisionism), investigates how the eye sees light. He devised a method of painting in small colored dots (pointillism) that rendered sensations of volumes in space.

Cézanne, like Seurat, analyzed what he saw in a disciplined, rational, and calculated manner. He developed a vocabulary of short colored marks that function as spatial signs rather than as accurate descriptions of the world. The marks make the viewer aware of their identity as brushstrokes on flat surfaces. Abandoning the long-established premises of linear perspective that postulates a consistent vision of nature, Cézanne juxtaposed multiple viewpoints, indicating that

➤ ROGER FRY

Roger Fry (1866–1934), art historian, critic, and painter, named and promoted postimpressionism. In numerous books and articles he explained the aesthetic premises of modern painting to a hostile British public. His theory, known as formalism, suggests that arrangements of shapes, tones, and colors can produce profound aesthetic emotions for viewers. For Fry, form—not subject—is significant. By freeing painting from the objective of having subjects that imitate the visible world and interpret anecdotal and literary subjects, Fry positioned visual art in the forefront of avant-garde expression. He became a fervent advocate of Cézanne's paintings, giving extensive exposure to the artist's work at both London postimpressionist exhibitions and writing a Cézanne monograph (1927). Fry's lucid texts contributed significantly to modernist theory and influenced the later critics Herbert Read and Clement Greenberg. Fry's most significant publication, still in print, is his collected essays, *Vision and Design* (first published in 1920).

—Marion Arnold

what we know about the underlying geometry of volumetric structure can be rendered on two-dimensional surfaces through signs that function as equivalents of perceptual information. Cézanne's work exerted a significant influence on Braque and Picasso and helped them to formulate cubism.

The leading postimpressionists worked within the traditional genres of landscape, portraiture, and still life but, with the possible exception of Gauguin, abandoned the narrative themes that continued to dominate academic painting in their era. The ideas they explored had a lasting influence on the development of twentieth-century movements, particularly fauvism, German expressionism, and cubism.

Cubism

In the early twentieth century, Cubism rejected the earlier representational conventions in art and radically redefined pictorial objectives. It is unhelpful to think that Cubism is concerned with cubes. The name was given flippantly when Henri Matisse made a joke about Georges Braque's geometric imagery submitted to the 1908 Salon d'Automne (Autumn Salon), an annual exhibition of modernist painting first organized in 1903.

Arguably the seminal twentieth-century art movement, Cubism has multiple sources. The most important are Paul Cézanne's (1839–1906) rejection of one-point linear perspective and adoption of faceted geometric planes to evoke structure and the arrival in France of art and artifacts from Africa and Oceania. The latter, like Cézanne's images, were conceptual rather than perceptual in their expressive objectives and motivated artists to look again at nonnaturalistic Egyptian art and archaic Greek sculpture. Cubism was initiated in Paris by Pablo Picasso (1881–1973) and Georges Braque (1882–1963), both of whom experimented independently with monumental simplified, geometric form before forging a close relationship in 1909 and sharing their ideas.

Although Cubism is characterized by continuous evolution, for convenience it is useful to consider an early Cézannesque phase (1907–1910) that yields to Analytical Cubism (1910–1912) and is followed by Synthetic Cubism (1912 onward). Early Cubism is defined by Picasso's *Les Femmes d'Alger* (1907). This radical work refers to African and Iberian sculpture in the way Picasso simplifies and distorts volumes and stylizes two female faces so severely that they resemble masks.

Analytical Cubism is typified by tertiary colors (neutral colors such as brown or gray) and

Pablo Picasso, *Les Femmes d'Alger (O. K. G.)*, 1907. (The Gallery Collection/Corbis)

an analysis of volumes into small faceted, transparent planes that allude to physical form but no longer demarcate solid objects and surrounding spaces. The flat picture plane became an ambiguous surface of references or signs with cryptic relationships to the world. As images grew more distorted and difficult to interpret, words were introduced as clues or evidence of the games that the artists played with reality and with their viewers.

Synthetic Cubism manifests a new sense of simplicity. Objects are delineated as flat shapes or are constructed through the addition of cut and pasted paper shapes (*papier collé*) and non-art materials. This strategy introduces questions about reality as illusion or as physical fact asserting the materiality and tactility of surfaces. Cubist ideas not only revolutionized representational codes but also asserted that modern life, daily behavior, and new ideas about time and space offered provocative stimuli for art located in the modern industrial, prewar twentieth century.

Although Picasso and Braque are known as the major Cubists (joined by Juan Gris [1887–1927]), their work was not widely exhibited in Paris and was known only to a small group of

THE CUBIST LEGACY

By destroying representational conventions, Cubism influenced painting, sculpture, design, and architecture throughout Europe. Having challenged the limits of art and traditional uses of materials, Cubism stimulated the transgressive spirit of Futurism, Dadaism, and Surrealism and, by defining a new formal vocabulary, motivated the rationalism of Neoplasticism, Suprematism, Constructivism, and Bauhaus design premises. Although the Cubists did not produce abstract art, the logical extension of their ideas was geometric abstraction that appealed to the mind. In Holland, the Neoplasticists van Doesburg and Mondrian developed *De Stijl* painting, which had no reference to the visible world and was essentially a philosophy about universal harmony. In postwar revolutionary Russia, where artists were involved in designing a new society, Malevich produced pure, nonobjective paintings determined by logic rather than the inner life that motivated Kandinsky's abstract paintings. Finally, Cubism was to influence post-World War II American Abstract Expressionism and Clement Greenberg's late modernist theories known as Formalism.

—Marion Arnold

artists and writers. The poet Guillaume Apollinaire referred to “the Cubists” in print in 1911, and the name was then adopted by a group who exhibited at the Salon des Indépendants. The Salon Cubists popularized Cubist ideas. The most influential of these artists were Albert Gleizes (1881–1953) and Jean Metzinger (1883–1956), who jointly wrote *Du Cubisme* (1912). Their paintings offered stylized but comprehensible images, while their sculptor colleagues—Jacques Lipchitz (1891–1973) and Henri Laurens (1885–1954)—analyzed volumes as semiabstract figurative structures.

Futurism

Futurism, which emerged in 1909 in a manifesto published in the Parisian newspaper, *Le Figaro*, was an affirmation of dynamic modernity. Stylistically, Futurist painting and sculpture resemble Cubism, but the Italian art movement was not an offshoot of Cubism. Although Cubist painting was moving toward the establishment of visual autonomy, Futurism located itself in the long-standing relationship between literature and art. The founder of Futurism was Filippo Tommaso Marinetti (1876–1944), an avant-garde poet, playwright, and impresario. Marinetti aimed to free Italy from the weight of inherited cultural traditions. His tactics were a series of aggressive manifestos and impromptu speeches in which his rhetorical language glorified violence and the machine age.

Marinetti's assertiveness attracted a group of young painters to his cause, and in 1911 Umberto Boccioni, Carlo Carrà, Luigi Russolo, and Marinetti joined Paris-based Gino Severini in a tour of Parisian exhibitions. They also visited the studios of Georges Braque and Pablo Picasso. In their Bernheim-Jeune exhibition of 1912 in Paris, the Italian Futurists attracted

considerable publicity through their shock tactics and self-promotion. They advocated the dissolution of boundaries among sight, sound, and touch (synaesthesia) and between the body at rest and the body in motion (kinaesthesia). Cognizant of modern technology, they introduced photographic information on movement (pioneering work by Eadweard Muybridge and Étienne-Jules Marey) into painting; this is seen in the painting of Giacomo Balla (1871–1958). In condemning the past, they affirmed speed, industrial mechanization, and violence. This ideology was to become subsumed in Italian fascism.

The Futurists issued many manifestos to gain publicity. In 1912 Ballila Pratella published a manifesto for music. This was followed by Russolo's "The Art of Noises" (1913), the result of his experiments with noise machines. Experiments in photography led to Anton Giulio's "Fotodinamica Futurista" (a 1912 manifesto) and "Manifesto of Futurist Cinema" in 1916. He then made a full-length Futurist film, *Perfido Incanto*. These manifestos and performances influenced the Dadaists. The Futurist painters were influenced by ideas on motion, dynamism, simultaneity, and temporality. These concepts resulted in rather literal paintings of multiple views and repetitive outlines rendered in the divisionist techniques of small brush marks. More radical were the sculptures of Umberto Boccioni (1882–1916). His *Unique Forms of Continuity in Space* (1913) manifests abstracted interior and exterior human form in motion. The work he completed before his early death in the war verged on pure abstraction, and his unorthodox use of materials echoed those that Picasso used in his relief sculptures.

Futurism was a movement dominated by aggression, exhibitionism, and words. Marinetti's provocative manifestos made outrageous statements: "a racing car is . . . more beautiful than the *Victory of Samothrace*"; "We will glorify war." The technical manifestos by the artists offer ideas on new subjects: "All subjects previously used must be swept aside in order to express our whirling life of steel, or pride, or fever and of speed"; "Our renovated consciousness does not permit us to look upon man as the

➤ A FUTURIST IN POLITICS

Futurism was a deeply nationalistic movement. Considered politically rather naive by most scholars, the Futurists wanted to impel Italy into the modern age by discrediting its rich cultural past and projecting faith in an industrialized future. Marinetti welcomed World War I (1914–1918) as an opportunity for cultural cleansing. After the war he attempted to align advanced art and technology with the emergent reactionary right-wing fascist ideology. In early 1918 he founded the Futurist Political Party, which a year later was absorbed into Mussolini's Fascist Party. Marinetti stood as a candidate in the 1919 election. He was not elected but eventually became Mussolini's cultural adviser. Marinetti's career within Futurism and the direction taken subsequently by Futurist ideas indicate that the movement was an exception to the usual alignment of modernist avant-gardism and left-wing politics.

—Marion Arnold

centre of universal life. The suffering of a man is of the same interest to us as the suffering of an electric lamp.” In 1914 Marinetti’s “free word poetry,” *Zang Tumb Tuum*, explored the concept of sound. It was printed in *Parole in libertà*, which had a modernist cover designed as a word picture with a variety of new typefaces. Marinetti favored a purely phonetic, textural, and graphic use of words in poetry, a point of

conflict with the Russian Cubo-Futurists who adopted a structuralist approach to language.

Migration and Travel

Travel (a word derived from the French *travailler*, meaning “to work hard” or “toil”) is the process of moving from one place to another or going on a trip or tour. Travel can be undertaken by an individual or large group, cover a short or long distance, and have countless motives. Migration is a unique form of travel and typically refers typically to movements of groups rather than individuals and involves the relocation of these groups outside their home community. Relocation may be as brief as the several months of a hunting or agricultural cycle, or it may be permanent. Migrations also have a narrower range of causes than travel. Voluntary migrations are undertaken by pastoralists and foragers in response to seasonal changes and by other groups to improve their economic condition or escape political or religious oppression. Involuntary migrations result from expulsion from one’s homeland, forced military service, or, in the case of slaves, capture and sale to individuals outside their community. Travel and migration have played central roles in human history from its very beginning; between 1750 and 1914 both underwent significant changes.

Histories of travel between 1750 and 1914 justifiably focus on technological innovation: the advent of steamships and railroads beginning in the early 1800s, the development of the gasoline-powered automobile in the 1880s, and the first successful airplane flight in 1903. Such developments are only part of the story, however. Significant innovations in overland and waterborne travel occurred before the steamship and railroad era. Even after this era began, horses, mules, and camels maintained their importance as means of personal travel, and animal-drawn transport and sailing ships continued to play major roles in moving people and goods in much of the world.

In the eighteenth and early nineteenth centuries, before or during the very first stages of the Industrial Revolution, water travel was becoming safer, faster, and less expensive. In Europe, especially England, and the United States, the movement of grain, coal, and a host of other goods was facilitated by a boom in canal building that began in the 1700s and continued well into the nineteenth century. Concurrently, ocean travel was made safer by the invention of the first practical sea-going chronometer, developed by the British craftsman John Harrison in several versions between the 1730s and 1760s. The most important advance in marine navigation since antiquity, Harrison’s clock enabled mariners to keep accurate time on the oceans, which in turn made it possible to plot longitude in addition to latitude. Ocean travel was also becoming more regularized. In 1817 the Black Ball Line, an American firm, transformed the haphazard transatlantic passenger trade by

scheduling and advertising monthly trips departing on the first of each month between Liverpool and New York City. It soon had many competitors on both sides of the Atlantic.

In 1817 the Black Ball Line, an American firm, transformed the haphazard transatlantic passenger trade by scheduling and advertising monthly trips departing on the first of each month between Liverpool and New York City.

Improvements in sailing ship design continued well into the early industrial era. By the late 1700s European and American shipbuilders were producing many types of specialized sailing vessels, the most impressive of which were the large and heavily armed East Indiamen, which carried goods and passengers between Europe and India and even China by way of the Cape of Good Hope. Blackwell frigates, which replaced the more

cumbersome Indiamen in the 1830s, were smaller but faster; they could complete the journey from England to Bombay (present-day Mumbai) in 85 days. History's fastest sailing ship, the clipper, was produced in the United States and elsewhere beginning in the 1840s. Designed originally for the voyage from the U.S. East Coast to the gold mines of California, it was capable of speeds of more than 30 miles (48 kilometers) per hour. Another significant innovation was the appearance of steel-hulled sailing ships in the 1850s. They were widely used for the transport of wool, grain, coal, and other products for which speed was not a priority. They disappeared from the world's oceans only in the late 1930s.

Fewer advances took place in overland travel in the prerailed era. In the Atlantic world, mainly in response to increased commercial travel, road building and maintenance attracted the attention of engineers and governments beginning in the 1700s. The French government founded a school of road and bridge construction in 1747 and appointed Pierre-Marie-Jérôme Trésaguet its first inspector general of roads in 1775. Trésaguet, along with two Scotsmen, Thomas Telford (1757–1834) and John McAdam (1756–1836), pioneered new methods of road construction, all using mixtures of large and small stones and gravel. Although the French government maintained a system of roads (*les routes impériales*) that linked France's major cities, in the United States and the rest of Europe road construction and maintenance were left to private entrepreneurs. Licensed and occasionally subsidized by governments, they built and maintained many miles of toll roads, or turnpikes, from which they hoped to profit. Despite these changes, overland travel, even on roads built according to the latest methods, could not compete with travel on rivers and canals. Horse-drawn loads on land moved no faster than 2 miles (3.2 kilometers) per hour, and the costs were high. In 1817 it cost 19.2 cents a mile to move a ton of goods from Buffalo, New York, to New York City; after the completion of the Erie Canal, the cost was reduced to less than 1 cent.

None of these changes—canal building, new sailing ship designs, and road construction—approached the significance of the steamship and the railroad. The first commercially successful steamboat was built in 1807 by the American inventor Robert Fulton; after a test run of the *Clermont* from New York City to Albany was completed in 24 hours, he

was awarded a monopoly for steamship operation on the Hudson River. In this remarkably inventive and entrepreneurial age, larger and faster steamships soon were plying the rivers, lakes, and coasts of the United States and Europe and crossing the world's oceans. Each decade saw innovations in ship design that made the vessels of the preceding decade obsolete: paddle wheels gave way to screw propellers; bulky wooden hulls were streamlined and made of iron; boiler and engine designs were improved; and by the end of the century steam turbines replaced reciprocating engines. By the 1890s, mammoth ocean liners with crews of 800 and passengers numbering over 2,000 were crossing the north Atlantic in a little over a week at speeds just under 50 miles (80 kilometers) per hour. The use of steamships and the opening of the Suez Canal in 1869 dramatically reduced travel time to Asia. The trip from Amsterdam to Java in the Dutch East Indies took a year in 1650, three months with favorable winds in 1850, and only three weeks in 1914.

Steam power also transformed overland travel through the railroad. Pulling loads on wooden tracks had been used in European mining operations since the 1400s, and iron tracks were first used in England in the 1780s. Between 1802 and 1825, English engineers designed and built steam-driven locomotives for use on private railways to serve coal mines, and then in 1825 the world's first public railway opened between Stockton and Darlington in England's coal-mining district. In 1830 the Liverpool & Manchester Line became the first railway linking two major cities, and soon passengers, mail, and goods were being transported on its 35 miles (56 kilometers) of track. The worldwide boom in railway construction had begun.

By 1914 networks of railroads crisscrossed Europe, with the densest in Germany, with 37,820 miles (60,865 kilometers) of track, and Great Britain, with 19,840 miles (31,929 kilometers) of track. The United States, with 429,040 miles (690,473 kilometers) of track, had knitted the country together with the completion of the transcontinental railroad in 1869, as did Canada in 1885 and Russia in 1903. Railroads were also introduced to Asia, Africa, and South America; by 1910 India had the world's fourth-largest rail network after the United States, Germany, and Russia. Decade by decade, engines became more efficient and powerful, braking systems were improved, and amenities for passengers such as lavatories, sleeping cars, heating systems, and dining cars became standard features. Rail technology not only revolutionized long-distance travel but also transformed how people moved about large cities. Many cities installed trolley car or tramcar systems in which vehicles, often powered by electricity, moved on rails built into existing streets. The world's first underground railway system opened in London in 1863, and the first electric-powered underground trains came into use in London in 1890.

By the early 1900s railroads and steamships had changed the world in many ways. Directly or indirectly they created millions of jobs. By the early 1880s the world's shipyards had produced 22,000 steamships, and its factories had produced an astounding 100,000 steam locomotives and 2.75 million carriages and wagons. Millions of workers were employed in these enterprises, and millions more were employed

mining coal, producing iron, laying track, constructing bridges, building stations, taking tickets, moving baggage, and administering railway and shipping companies. By reducing costs and transit times, steamships and railroads also contributed to the fourfold increase in world trade between 1850 and 1910.

Faster and cheaper transportation led to other changes in how humans lived their lives. Mail services were expanded and improved. New suburbs, made possible by railway lines and metro systems, mushroomed around major European and American cities. Tourism—travel for relaxation, fun, a change of pace, or enlightenment—was transformed from an activity of young aristocrats, who toured European capitals and cultural centers as part of their informal education, to one enjoyed by large numbers of middle-class and even working-class Europeans and Americans, who flocked to spas, beaches, ski areas, and mountain resorts. An indication of tourism's popularity and economic importance is the emergence of travel companies such as Thomas Cook and Son. Founded in 1841 when Cook arranged an 11-mile (18-kilometer) railroad trip for 570 temperance campaigners from Leicester to Loughborough, England, by the end of the century the firm had offices worldwide; arranged thousands of annual tours to every inhabited continent (including trips around the world); marketed its own lines of guidebooks, luggage, and travel ware; and made travel arrangements for millions of individual customers. Most importantly, cheap travel by rail and steamship contributed to an unprecedented surge in world migration between the early 1880s and 1914, when more human beings left their homes for lives in new lands than in any 25-year period in history.

Although migration peaked in the late nineteenth and early twentieth centuries, large-scale migration was a defining characteristic of the entire era from 1750 to 1914. Until the mid-1800s, migration mainly involved the involuntary movement of human beings destined for slavery. These migrants were mainly Africans who labored in the mines and fields of the Americas and the Caribbean. Of the 10 million to 12 million Africans sold into slavery during the era of the transatlantic slave trade, slightly more than half did so between 1750 and 1867, the year in which the last legal shipment of slaves arrived in Havana, Cuba, in a Spanish ship. Even after Great Britain (1807), the United States (1808), Denmark (1802), the Netherlands (1814), France (1818), and Spain (1867) outlawed the slave trade, it continued illegally until slavery itself was abolished in Cuba and Puerto Rico in 1886 and Brazil in 1888. Many slaves in the Americas experienced further migration after they or their ancestors had completed their Atlantic crossing. As cotton culture spread across the southern United States, for example, many slaves born on plantations in coastal states were sold to planters in western Alabama, Arkansas, and Texas. Slavery also caused the forced migrations of Sudanese to Egypt, where they served as laborers and soldiers; of East Africans and Indians who worked on the plantations of the Indian Ocean islands of Mauritius and Réunion; and of still other Africans who crossed the Sahara in caravans to serve as servants or concubines in North Africa and parts of the Middle East.

The gradual abolition of slavery in the 1800s did not lessen the worldwide demand for cheap labor. To a degree, migrant workers from the world's poorer regions, especially China and India, were recruited to fill this need. Many of them were indentured servants, who in return for their passage were required to work three to seven years on plantations or in mines. It is estimated that 30 million to 40 million Indians migrated between 1830 and 1914, dispersed around the globe to places such as Mauritius, South Africa, Fiji, Sri Lanka, Myanmar, and Malaya. They were joined by as many as 40 million Chinese, who emigrated to many of the same regions that attracted Indians. Unlike the Indians, however, they also settled in South America, Canada, and the United States. In the United States, unease over their numbers and "strangeness" led to a series of bans on Chinese immigration that were not lifted until China became a U.S. ally in World War II.

These Indians and Chinese and lesser numbers of Japanese and Filipinos accepted the risks and hardships of emigration mainly out of economic necessity. Population growth, most rapid in India and China, created shortages of arable land as well as rising rents and growing rural poverty. Many Chinese and Indian peasants responded by migrating to cities or to relatively less populated areas such as the offshore island of Taiwan for the Chinese and the northwest region of Assam for the Indians. But many more came to view overseas migration as the best choice.

A deteriorating rural economy also was the main cause of the flood of migrants who left Europe in the nineteenth and early twentieth centuries. Modest numbers of Europeans—somewhere around 800,000—had migrated and permanently settled in the Americas in the more than 300 years between the time of Columbus's discoveries and the early nineteenth century. Then in the slightly more than seven decades between 1840 and 1914, 50 million to 60 million people left Europe for the Americas and other regions, and millions more migrated from rural regions to cities, either permanently or to pursue part-time employment. Overwhelmingly, their motives were economic. During the nineteenth century the lives of Europe's small farmers, peasants, and full-time agricultural workers disintegrated in the face of population growth, the consolidation of small farms into large ones, and on these larger farms the use of seasonal rather than year-round labor. Equally devastating was the decline of rural industry, as mechanized textile mills replaced the work of spinners, weavers, and lace makers whose labor had provided income for rural households. Crop failures also played a role. It is no accident that the first upsurge in European emigration occurred in the "hungry forties," when the potato crop withered and died in Ireland and across northern Europe. While economic hardship pushed millions of migrants out of Europe, economic opportunities pulled them to the Americas and other regions. With land at a

The gradual abolition of slavery in the 1800s did not lessen the worldwide demand for cheap labor. To a degree, migrant workers from the world's poorer regions, especially China and India, were recruited to fill this need.

premium in Europe, it was hard to resist the lure of the cheap or even free farmland provided by the U.S. Homestead Act (1862), the Canadian Dominion Lands Act (1872), and various land ownership laws passed by the Australian colonies in the 1860s and 1870s. For nonfarmers, it was equally hard to ignore the opportunities for jobs in heavy industry, food processing, commerce, manufacturing, mining, and services of many different kinds. Finally, in the second half of the nineteenth century, railroads and steamships lowered the costs and reduced the hardships of overland and ocean travel. In the 1860s it took 44 days by sailing ship to complete the trip from northern Europe to the United States, but in the 1880s it took only 10 days by steamship and just a week in the early 1900s. Competition among shipping companies and booking agents reduced costs to the point that a ticket from Liverpool to New York City could be purchased for only nine dollars, an amount that could be earned by one week's labor in the United States.

Increased human mobility, a marked feature of world history between 1750 and 1914, continued to accelerate in the twentieth century. In 1908 the first Model-T Ford rolled off the assembly line in Detroit, and with it the automobile age can be said to have begun. The first commercial airline flight took place in January 1914, when regular service was opened up between St. Petersburg and Tampa, Florida; the first regularly scheduled transatlantic flights began in 1939 when Pan American Airlines began service between New York City and Marseilles. Migration also grew and changed character. Transnational labor migration peaked in the decade before World War I, but the movement from rural areas to cities continued to grow. By the end of the century, just under half of the world's population lived in cities with more than 20,000 people. Sadly, the twentieth century also swelled the numbers of another type of migrant: refugees driven from their homes in flight from the century's many political conflicts, wars, and genocides.

■ Introduction: Involuntary Migration

Involuntary migration, simply defined, refers to the movement of individuals from their homeland to a new community against their will. Unvaryingly, force or the threat of force is involved. Between 1750 and 1914 more human beings became involuntary migrants than in any other comparable period in history. They included prisoners transported to penal colonies, children who were forced to leave their homes to accompany their migrating parents, victims of warfare, and native peoples of the Americas, New Zealand, Australia, and Africa who were

driven from their land after it had been appropriated by white settlers. By far, however, the largest group of involuntary migrants consisted of black African slaves who were forced to move from one part of Africa to another or to more distant places such as the Middle East, Indian Ocean coastal regions, or the Americas.

Each type of involuntary migration had distinct causes, but all were related to the emergence of a global economy and the expansion of European power around the world in the eighteenth and nineteenth centuries. Penal colonies

utilized by the Russians, French, and British as destinations for convicted criminals all were founded in distant parts of these European countries' empires: Siberia for the Russians, Guyana in South America and New Caledonia in the Pacific for the French, and the American colonies and Australia for the British. The forced migration of aboriginal peoples from their homelands also was tied to European expansion and colonization. It began with the arrival of the first Spaniards on Hispaniola and Cuba in the early 1500s but peaked in the nineteenth century, when the Boers began their Great Trek in South Africa, the British began to colonize Australia and New Zealand, and Americans, Canadians, and newly arrived immigrants began to fill up North America. In 1830 during the presidency of the former Indian fighter Andrew Jackson, Indian removal to the west became official policy of the U.S. government.

The upsurge in slavery worldwide resulted in part from demands for soldiers, manual workers, domestics, concubines, and agricultural laborers in the Middle East and Indian Ocean coastal regions, but it mainly was caused by the demand for cheap labor on the plantations of Brazil, the Caribbean, and North America that produced sugar, tobacco, indigo, rice, and cotton for the world market. Some Africans who were transported overseas as slaves already had been enslaved in Africa because of indebtedness or some other crime, but most were captured as a result of wars, slave raids, or kidnapping. Slave raiders profited when they sold their slaves to African coastal merchants; who profited when they sold slaves to European slave traders; who profited when they sold the slaves to plantation and mine owners in the Americas and the Caribbean; who profited when they sold the products the slaves produced to European businessmen; who profited from the sale of cotton shirts, snuff, coffee, candy, rum, processed sugar, and a host of other products to millions of consumers worldwide. With so many people profiting from and depending upon slave labor, the stupendous growth of the slave trade in the eighteenth century is unsurprising. During the 1700s slightly over 6 million Africans were sold into slavery in the Americas alone, compared to the approximately 200,000 prisoners transported by the

British to overseas penal colonies in the eighteenth and nineteenth centuries.

In the course of the nineteenth century, the number of involuntary migrants declined. The British shipped the last load of criminals to Australia in 1868. By the 1880s, the Native Americans, the First Nations in Canada, Australian aboriginals, and various African peoples who had survived decades of disease, displacement, and warfare were all safely settled in reservations or native reserves. The greatest change was the shrinkage of the slave trade. Although an estimated 3.3 million Africans were sold into slavery overseas between 1801 and 1900, most of this occurred in the first part of the nineteenth century. In 1792 Denmark outlawed the slave trade, although the ban did not take effect for another ten years. In 1807 Great Britain and the United States made the slave trade illegal, with the U.S. ban taking effect on January 1, 1808; in the decades that followed the major mercantile states of Europe and the Ottoman empire followed suit. In Africa, French and British colonial authorities took steps to suppress slavery and slave raiding within Africa. The world's two greatest sugar producers, Brazil and Cuba, outlawed the slave trade in 1850 and 1866, respectively, but smuggling continued until Cuba outlawed slavery in 1886 and Brazil did so in 1888. By then, forced migrations in the previous century and a half had changed the world economy, affected ideas of race, contributed to new ideas of nationhood, altered world demographics, and affected millions of lives.

The Transatlantic Slave Trade, 1750–1900

The flow of slaves across the Atlantic to meet the demand for labor in the New World was an integral part of the expanding global economy in the early modern period. The slave trade further integrated Africa into the global economy, although not on an equal footing with Europe. The trade and the slavery on which it was based reduced people to commodities, stripped them of freedom, and classified them by race, fostering a racism that still persists in the United States and other parts of the world. The slave trade was the largest forced migration in history.

The print “Stowage of the British Slave Ship Brooke” was produced in 1789 by English abolitionists to show the inhumane conditions on a slave ship that carried the maximum number of slaves permitted by the Regulated Slave Trade Act of 1788. (Library of Congress)

The discovery of the Americas created new economic opportunities, especially in agriculture and mining. In 1493 only a year after his first voyage, Christopher Columbus introduced into the Caribbean sugarcane, the crop on which Europeans built the first plantations in the New World. Sugarcane demanded, particularly at harvest, a large labor force. Europeans sought to meet the demand for labor by using criminals, orphans, and indentured servants and supplemented these sources with Native Americans. But none of these expedients sufficed. Native Americans succumbed to Old World diseases, and the supply of European laborers met only a fraction of the demand. In the mid-fifteenth century the Portuguese had solved the problem of labor by enslaving Africans to grow sugarcane on São Tomé and the Madeiras, islands off Africa’s Atlantic coast. The Spanish introduced African slaves to the New World when they imported the first slaves to Hispaniola (now the island of Haiti and the Dominican Republic) in 1502.

The institutionalization of slavery in the New World led directly to the slave trade due to the fact that demand for slaves outpaced the growth in supply by natural increase nearly

➤ A SLAVE SHIP ARRIVES IN BARBADOS

The following excerpt comes from a widely read autobiography of Olaudah Equiano, who was kidnapped and sold into slavery in Africa. After serving several masters, he was freed and became a leading critic of slavery and the slave trade.

“At last we came in sight of the island of Barbados, at which the whites on board gave a great shout, and made many signs of joy to us. We did not know what to think of this; but as the vessel drew nearer, we plainly saw the harbor, and other ships of different kinds and sizes, and we soon anchored amongst them, off Bridgetown. Many merchants and planters now came on board, though it was in the evening. They put us in separate parcels, and examined us attentively. They also made us jump, and pointed to the land,

signifying we were to go there. We thought by this, we should be eaten by these ugly men, as they appeared to us; and, when soon after we were all put down under the deck again, there was much dread and trembling among us, and nothing but bitter cries to be heard all the night from these apprehensions, insomuch, that at last the white people got some old slaves from the land to pacify us. They told us we were not to be eaten, but to work, and were soon to go on land, where we should see many of our country people.”

everywhere in the Americas. By 1750 Portugal, Britain, the Netherlands, Denmark, and France transported just over 51,000 slaves a year from Africa to the Americas. The dominant slave traders were Portugal and Britain, each of which tallied more slaves than the Netherlands, Denmark, and France combined.

The European powers established fortresses on the western coast of Africa. Tropical diseases and the lack of manpower prevented them from penetrating the continent's interior. Instead they depended on Africans to deliver slaves to them. Poorly fed and confined in close quarters on the coast and aboard ship, Africans were vulnerable to disease. Mortality increased with the length of a voyage, from less than 10 percent for a crossing of fewer than 20 days to nearly 25 percent for a crossing of more than 2 months. Malaria, yellow fever, and intestinal disorders caused two-thirds of all deaths, and smallpox, scurvy, and suicide caused the remaining one-third. Once a ship set sail slaves, crammed 100 to 1,000 per ship depending on its size, were at the mercy of the weather. Rain often prevented them from getting fresh air on deck and increased the likelihood of disease. Storms occasionally sank ships. In these instances crews frequently abandoned slaves, kept below deck, to their fate. The vagaries of wind could lengthen a crossing. The voyage from the Guinea Coast required a ship to cross the doldrums twice, each time risking a prolonged calm. Ship captains, who seldom had more than three months of food on hand at the beginning of a voyage, reduced slaves' rations at the first inkling that a crossing might take longer than expected.

Once a ship landed, an inspector checked slaves for transmissible diseases. The detection of a sick slave lengthened slaves' confinement aboard ship in quarantine. Disembarkation at last gave slaves access to fresh food and water but also confronted them with the ordeal of sale. Slave traders felt no compunction about separating family and friends and disrobing slaves for inspection by potential buyers. Sellers usually auctioned slaves, the young and old first, followed by men and then women who appeared to be fertile. Women of childbearing age commanded a higher price than prepubescent and postmenopausal women because buyers, despite denials, appreciated the potential of these

women to reproduce. As an alternative to auction, a seller specified the price of slaves of similar age and physical condition and permitted buyers to pick from this group, much as buyers select a car from a dealer's lot.

By the nineteenth century the slave trade had fallen out of favor. The planters in the United States and Barbados, with a self-sustaining slave population, did not need to import slaves. Enlightenment thinkers branded slavery and by implication the slave trade as inhumane and wasteful. The Society of Friends (Quakers) and other religious reformers declared slavery and the slave trade contrary to the tenets of Christianity. Denmark in 1802, Great Britain in 1807, the United States in 1808, the Netherlands in 1814, France in 1817, Spain in 1820, and Portugal in 1819 (north of the equator only) ended the slave trade. Slaves continued to be smuggled into Cuba and Brazil until Britain pressured Cuba to abandon the slave trade in 1867. Brazil followed in 1888, ending four centuries of commerce in humans.

In the short term the end of the slave trade left the nations of North and South America to grapple with the legacy of slavery. The United States fought a civil war over slavery, although other nations in the Americas assimilated the former slaves without tumult. The degree of interbreeding in some societies made it difficult to determine whose ancestors had been slaves and whose had been free. Often, as in Brazil, one's pedigree was a mix of both slave and free, negating the stigma of the slave trade. Over the long term the slave trade reduced Africa to an appendage of Europe, first as a network of colonies and today as an economic dependent of both Europe and the United States.

The Slave Trade on Africa's East Coast

The Indian Ocean slave trade on the east African coast was older and lasted longer than the transatlantic slave trade on west African shores.

Slave trade on Africa's East Coast is ancient, probably as old as the Indian Ocean trade, which goes back at least to the first century CE, when Greek and Roman merchants from Egypt and other merchants from India sailed the Red Sea route to Rhapta (a port thought to have been located on the Somali coast) to purchase cargoes of ivory, tropical woods, and slaves. By the fourth century CE, Ethiopian traders from the Red Sea port of Adulis were very active in Indian Ocean trade, including slaves, as hoards of Gupta and other Indian coins discovered in Ethiopia attest. In the mid-seventh century, the increasingly powerful Muslim Arabs began to dominate Indian Ocean trade, forcing the Ethiopians to take refuge in their highlands.

About a century after emergence of the Arab traders on the Indian Ocean, Swahili trading cities began to appear on the coast and the islands off the coast of what are today Kenya, Tanzania, and Mozambique. The Swahili, an ethnic group who speak Swahili, a Bantu language, became very active traders by the eighth century, dealing with Arabs and Persians who settled in these towns. The Swahili intermarried with the Muslim merchants and became devout Sunni Muslims. The Swahili continued to trade in slaves; in fact, slaves may have become the most important item of commerce. Many east African slaves were sold to work on burgeoning sugar plantations in southern Iraq. In the ninth century, African slaves were so numerous in southern Iraq that they rebelled and established their own state (869–883), the suppression of which required a major effort by the Abbasid caliphate.

East African slaves continued to be a major, but not exclusive, element in the commerce of the Swahili cities. Swahili traders also exported ivory, tropical woods, pig iron, green quartzite,

and, increasingly, gold from the mines of Great Zimbabwe. The Swahili cities prospered until the Portuguese conquered most of them, beginning in 1505. Portuguese occupation of these east African ports lasted more than two centuries, during which time Portuguese attempts to monopolize or control Indian Ocean trading routes disrupted much of the commerce in the area. Portuguese occupation, however, probably stimulated the slave trade. The Portuguese, with their plantation colonies from Brazil to Indonesia, required a copious supply of cheap slave labor. Most slaves for these plantation colonies came from western Africa, but eastern Africa, especially Mozambique as well as Madagascar, also contributed slaves to the plantation colonies.

Slaves continued to be purchased from the Portuguese by the Arabs, Persians, and Ottoman Turks. Many of these slaves were used in the households or harems, and for this reason many of the male slaves were castrated. In the Ottoman empire, both black slaves from Africa as well as white slaves from Europe were used. In the sultan's palace, white eunuchs were employed as general servants. For those who rendered intimate personal service, such as bathing and dressing the sultan's wives and concubines, black eunuchs were preferred.

In the late seventeenth century Saif Sultan, the ruler of Oman, began to create an Omani empire by driving the Portuguese from the Swahili cities. By 1730 all of the Swahili ports were in Omani hands except those in Mozambique. From then on, the Portuguese played a minor role in Indian Ocean commerce. Swahili merchants were free to deal with the Dutch, English, and French, who were all clamoring for slaves. Most of the slaves who stocked the plantations of these European states came from western Africa, but early in the eighteenth century the French began to develop extensive plantations on Mauritius and Ile de France (Réunion). The eighteenth century witnessed a boom in plantation agriculture, and with it came a burgeoning of the slave trade, both on the west and east coasts of Africa.

Zanzibar became the leading entrepôt for the export of east African slaves. Slaves would be bought by merchants who traveled up to several hundred miles into the interior of Africa, accompanied by *askaris* (armed guards). When enough

slaves had been purchased, the merchants would turn around and march them to holding pens on Zanzibar Island. At the beginning of the eighteenth century, the demand for slaves was still light enough that it could be met by peaceful purchase of individuals who had fallen into slavery by social processes customary to African cultures. But as the demand for slaves began to outstrip the supply in the latter part of the eighteenth century, slave-hunting expeditions were sent out to capture new supplies of slaves. Slave hunting often resulted in burnt and destroyed villages, much killing, and the disruption of any kind of social stability. For hundreds of miles deep into the interior of eastern Africa, the people lived in constant fear of the slave catchers.

The eighteenth and early nineteenth centuries constituted the heyday of the slave trade on the east African coast. While the British and the Americans outlawed the international slave trade in 1807 and sent naval forces to patrol the seas in an attempt to interdict the trade, the Atlantic slave trade, though illicit, continued at a reduced rate until 1860. On Africa's East Coast, it continued until 1890 (and later illegally into the twentieth century).

By the 1840s, the British began to use their power in the Indian Ocean to coerce east African rulers to take steps to end the slave trade, but it was not until 1873 that the sultan of Zanzibar was forced to issue a decree ending the slave trade. Gradually enforcement of this decree resulted in a virtual cessation of the trade. However, slavery continued to be legal in parts of the British East Africa Protectorate into the early twentieth century.

The Trans-Saharan Slave Trade

The centuries-old trans-Saharan slave trade persisted during the Atlantic trade era, peaking in about the middle of the nineteenth century and gradually declining in most areas between the 1880s and about 1914. The export trade to Muslim North Africa and West Asia involved an estimated 2 million slaves in the nineteenth century, with the largest number traveling across the Sahara desert from the savanna west of the Nile Valley toward the Ottoman Empire and parts of the Indian Ocean world.

The expanding numbers of enslaved Africans were more the result of internal events than a response to increasing demand from foreign merchants. The mid-nineteenth-century droughts, civil unrest, and political instability in West Africa helped to increase the number of human commodities. Although the trans-Saharan trade paralleled the transatlantic era, there was little stimulus from the maritime networks. Only in the Atlantic coastal region of the western Sudan was there any overlap between the two slave trading systems.

The enslaved Africans that fed the trans-Saharan markets originated mostly through raiding activities or capture in holy wars (jihad) carried out by small Muslim states in the eighteenth century. Slaves served in harems, as porters on trading caravans, as servants, and as soldiers in military actions. Their forced labor supported the growth of so-called legitimate commerce, including plantation agriculture, as well as mining and herding. Importantly, political prisoners were moved as far as possible from their point of origin along the edge of the Sahara. The value of slaves increased with the length of their journey alongside other trans-Saharan export commodities, such as salt, gold, and kola nuts. The bulk of the captives ended up in Morocco and Libya, whose ports then extended the journey eastward into Asia. By the 1800s the political economies of both North Africa and West Africa were also dependent upon slave exports for their supplies of money, luxury textiles, firearms, and horses.

The slave trade increased through much of the nineteenth century. The Turko-Egyptian conquest of Sennar (on the Nile River) in 1820 led to a sharp increase in slave recruits for the

► EYEWITNESS TO THE SLAVE TRADE—SIR HUGH CLAPPERTON'S MISSION

The journey of Scotsman Hugh Clapperton's second expedition to West Africa (1825–1827) as recorded in his diaries provides insightful analysis of views on the trans-Saharan slave trade. His journey was a British government mission that involved travel from the Bight of Benin (Nigeria) and sought the source of the Niger River. Clapperton observed that both raiding and regional conflicts such as the Sokoto Caliphate's jihad, which had broken out in 1804–1808, produced the bulk of war captives for the trans-Saharan trade. Although Muslims opposed the sale of slaves to Christians, Clapperton reported that the Sokoto government taxed this trade. Many profited from the trading caravans, including the women who followed them with foods: “boiled beens Maize Yams fowels and pudding for sale,” as the Clapperton diary entry on June 22, 1826, reported. That very year the conflicts between the Sokoto caliphate and Borno relied on weapons obtained through the slave trade.

Clapperton also participated in the debate over the slave trade and “just” enslavement within the caliphate itself. The writings of Al-Hajj ‘Umar (ca. 1835), ruler Muhammad Bello, and others indicated the Muslim dimensions of the debate over abolition. British and Muslim ideas embraced common elements of cautious expediency when it

Scottish explorer Hugh Clapperton. (Library of Congress)

came to fully condemning the slave trade. Ultimately Clapperton's expedition failed to wring any impact or influence. His observations and interactions do reveal the autonomy of nineteenth-century Muslim states in the interior of Africa and thus their eventual role in abolishing slavery in the century to follow.

Egyptian army. After 1840 the Sudanese expanded their commercial networks and supplied the region's production sector with slave labor from the northern Niger region to Darfur. One famous merchant, Al Zubayr, settled in the Bahr el Ghazal with a private slave army that numbered 1,000 in 1856. In 1878 his son Sulaiman's army was estimated at 6,400. Soon afterward, in 1896, the export trade in slaves was almost completely eliminated by a British and Egyptian blockade, although the local use of slave labor persisted into the twentieth century.

The abolition of slave trading by European governments beginning in 1807 initially had very little impact on the trans-Saharan trade. Even while the slave trade was being banned by many governments, slavery was increasingly embraced as a nineteenth-century economic strategy across

the African interior. The eventual abolition of slavery by European colonial states had varied consequences for the regions involved in trans-Saharan exports. In most places, including Chad, Borno, and Mali, slavery continued after the establishment of French or British colonial rule in the 1880s but was of lesser importance as an institution. The British were most determined to end the trans-Saharan trade and less concerned about the continued use of slave labor. In 1899 the British governor of the Sudan actually called for discretion in gradually eradicating slavery. Still, the export trade in slaves was halted in most of Africa, with the exception of the Wadai-Kufra route across the Sahara. Its legacy of political instability, raiding, and dependency relationships continues to torment the Saharan regions of the Sudan.

Migrant Labor in South Africa

Migrant labor in South Africa during the period 1750–1914 is generally characterized by the exploitation of indigenous groups to meet colonialists' growing labor needs. South Africa began as a Dutch colony that served as an outpost for shipping goods to and from Asian markets. The Cape Colony functioned as a restocking station where ships could acquire fresh produce and make repairs. As shipping to the Indian Ocean increased, demand for foodstuffs rose, and in response the Dutch East India Company (DEIC) began to sponsor migration to the colony to support food production by giving land to European farmers, called Free Burghers, who wanted to settle in the Cape area. To support the early labor needs, the DEIC also imported Asian slaves from its eastern colonies.

As the number of European migrants to South Africa increased, the Dutch colony began to expand inland to what was viewed as open territory. However, colonial expansion led to land conflict between migrant farmers and African groups, including the San, Khoikhoi, and eventually Xhosa peoples. Dutch migrant farmers, called Trekboers, expanded into the interior and after defeating the San and Khoikhoi used them for slave labor to assist in producing goods. The Trekboers attempted to remain autonomous from the political structure in Cape Town, but they were important producers of items such as sheep, cattle, and butter, which they sold to the Cape Colony.

Britain gained control of the South African colony after Napoleon agreed to a cease-fire at the Treaty of Amiens in 1803. The change to

British rule fundamentally altered the economic and political landscape in South Africa. In 1820 a large number of British settlers migrated to eastern South Africa to farm. Many had little knowledge of farming, and they relied heavily on enslaving indigenous groups. The added number of migrants placed additional population pressure on indigenous groups already in the region, including Xhosa and Zulu peoples, and also caused conflict between farmers of Dutch ancestry, called Afrikaners, and the British.

In the mid-1830s Britain began a process of gradual emancipation of slaves, which led to major changes in South Africa. Khoikhoi and San slaves became victims of a system of debt servitude and sharecropping so that white society could continue to use them as a labor source. Racism was a major underlying concept of Afrikaner politics, which led to the later system of Apartheid and underscored the rationale behind labor relations with indigenous Africans in the latter half of the nineteenth century and the early twentieth century.

The discovery of gold and diamonds in the 1860s led to intensive urbanization in a short

➤ AFRIKANER MIGRATION AND AFTERMATH

Afrikaners viewed British policies as an encroachment on their way of life and left the Cape Colony area in 1836 on what is called the Great Trek. By the end of the decade approximately 6,000 Afrikaners, called Voortrekkers, along with 5,000 Khoikhoi servants traveled into the interior and by the 1850s formed their own system of government. Eventually Afrikaner autonomy came to an end with their defeat during a bloody conflict called the South African War (Boer War) in the early 1900s. However, Afrikaners were able to regain political control through a constitution that favored white voters and established color bars (a system of regulations limiting Africans' rights) in their favor. Apartheid developed from this political system, which attempted to segregate Africans from white society while manipulating them as a source of manual labor. During this encroachment on their rights, Africans attempted to form labor movements, but most of their strikes were brutally crushed by the powerful mining corporations.

—Adam Paddock

period of time with the founding of cities such as Johannesburg. In order to find labor to work the mines, the British and Afrikaner governments implemented a series of laws to force indigenous people to fulfill their labor needs. The introduction of a tax on indigenous Africans forced them into wage labor, and the pass law of 1895 restricted their movement within different regions of the country. This law prohibited Africans from changing jobs, which curbed labor competition. In order to further maintain low labor prices, the Witwatersrand Native Labor Association (WNLA) promoted the migration of industrial workers from around the world, particularly from China.

The Natives Land Act of 1913 required all Africans not working in industrial labor to remain in areas designated as reservations, labeled by Afrikaners as Homelands. These areas often contained the least fertile land, and an increasing population among Africans led to starvation and disease. Generally, men working the mines were allowed to relocate to segregated areas near cities, but their families were required to remain in the reservations. Conditions for African migrant laborers were deplorable barrack-style housing without running water, heat, or electricity. Homelands essentially functioned as reservoirs of African labor used to meet Afrikaner labor needs.

Transportation of Convicts to Australia

In January 1788, 18 years after Captain James Cook claimed the eastern coast of Australia for the British Crown under the name New South

Wales, 11 British ships sailed into Botany Bay carrying the continent's first white colonists, almost three-quarters of whom were convicts. Over the next 80 years, the British government would send around 160,000 convicts to Australia, coerced migrants sent from Britain for penal, economic, and imperial reasons. Vastly outnumbering free migrants until the gold rushes of the 1850s, they provided the labor upon which Australian economic growth was founded and paved the way for the influx of free migrants that started in the 1830s.

During the seventeenth and eighteenth centuries, transportation to its North American colonies was used as a punishment in Britain for a range of lesser criminal offenses. However,

Convicts arrive in Australia, about 1820. With an independent United States no longer available to accept its convicts, Britain laid claim to Australia, with penal settlements beginning in 1788. Over the next eighty years approximately 165,000 convicts were resettled in Australia. (Jupiterimages)

with the outbreak of the American Revolution in 1775 this system ended, leaving hundreds of criminals already sentenced to transportation to America crowding in inadequate jails. An alternative needed to be found, and eventually the decision was made to return to transportation. However, instead of selling convicts as bonded servants for the term of their sentences to employers in already-established colonies (as had been done in America), the British government decided that a penal colony would be founded. The site that was eventually selected in 1786 was New South Wales. While it would seem that the primary motive for the settlement of Australia was a penal one—it was to be a faraway dumping ground for British convicts—it has also been suggested that there may have been strategic, geopolitical, and commercial motives.

Around 82,000 convicts were eventually sent to New South Wales between 1788 and 1840, with numbers greatly increasing after the end of the Napoleonic Wars and peaking in the 1830s. Sixty-eight thousand convicts were also sent to the colony of Van Diemen's Land (now Tasmania), the first party of settlers having been sent there in 1803 to affirm British rights to the island when it was feared that a French occupation was imminent. Finally, after 1850, around 10,000 convicts were also sent to the colony of Western Australia, which had been founded in 1829 and was struggling with a labor shortage.

Convicts and ex-convicts largely made up the workforce in Australia during its first 50 years of European settlement. Most having been convicted of offenses against property in Britain and Ireland, they were usually young, reasonably healthy, and predominantly male. Only about one-sixth of those transported to the eastern colonies were female; the convicts sent to western Australia were all male. Bringing to Australia a range of skills, they were either employed by the government or assigned to work for private employers. While male convicts worked on public works or labored in rural areas, female convicts were usually employed in domestic service or other indoor labor. Male convicts who proved recalcitrant could receive punishments ranging from flogging to working in chain gangs to being sent to a penal settlement; the usual punishment for female convicts was confinement.

➤ HARDENED, PROFESSIONAL CRIMINALS OR OCCASIONAL, PETTY THIEVES?

All the convicts who were transported to Australia had been found guilty of breaking the law. However, historians are divided as to their degree of criminality. During the 1950s, 1960s, and 1970s, the consensus that emerged from a number of prominent studies (by Manning Clark, Alan Shaw, and Lloyd Robson, among others) was that Australia's convicts were mainly hardened criminals who were members of a criminal subculture; they were transported for relatively serious offenses and were often repeat offenders. In the late 1980s, however, a new collaborative study edited by Stephen Nicholas and titled *Convict Workers* argued that most convicts were ordinary members of the British and Irish working classes who had held regular employment prior to conviction; they were usually first-time offenders found guilty of petty theft. The study was greeted with a storm of debate, and while some historians have accepted the revisionism presented in *Convict Workers*—appreciating its shift in focus away from convicts as criminals to convicts as workers—others have questioned the study's methodology and novel interpretations of the convict data.

—Amy Lloyd

Good behavior could be rewarded by remittance of sentence. Convicts, moreover, had a range of legal and political rights that allowed them to actively participate in the colonies' affairs. Transportation to Australia was a very effective form of migration, as very few returned to Britain after serving their sentences. Those who stayed in Australia (called emancipists) gained the same legal rights as free citizens and often became valuable, and even prosperous, members of society; social relations between them and the "respectable" free migrants, however, were strained. While colonial employers were largely satisfied with the convict system, transportation faced increasing opposition in Britain during the 1820s and 1830s: it was increasingly criticized as an ineffective deterrent to crime and as a system of slavery that corrupted and demoralized not only the convicts and employers but also society in general. In 1838 a parliamentary committee

was appointed and ultimately recommended the abolition of transportation to New South Wales. This resulted in the suspension of transportation to that colony in 1840. Transportation was eventually abolished in Van Diemen's Land in 1853 and in western Australia in 1868.

Indigenous Australians in the Nineteenth Century

When the first British settlers arrived at Sydney Cove in Australia in 1788, approximately 300,000 Indigenous Australians were living in distinct communities throughout the continent. For more than 40,000 years their ancestors had lived in Australia, where as hunters and

food-gatherers they had established a complex and rich oral tradition with a reverence for the land and a spiritual belief in what they called Dreamtime. Their numbers, however, were reduced drastically during the nineteenth century primarily through newly introduced diseases (measles, whooping cough, and influenza) and through the pacification by force policy adopted by the new white settlers.

At first the small number of newcomers lived in and around the settlement of Sydney, but by the 1820s their expeditions pushed out across the Blue Mountains westward, northward into Queensland, and south to Melbourne and Victoria. More often than not they met violent resistance from the Indigenous Australians, who saw their lands being appropriated by the advancing foreigners. In 1828, for example, 28 settlers in Van Diemen's Land (Tasmania) were killed and their houses burned within a month's time. The governor declared martial law, and in 1830 a group of 3,000 armed men formed a barricade (the Black Line) across the island and physically pushed the inhabitants to the coast. This massive offensive prevented any further attacks upon the whites in the area, and eventually the indigenes agreed to move to a reservation on Flinders Island, just off the coast. Once there, they all succumbed to various diseases. The last Indigenous Tasmanian to survive—a woman named Truganini—died in 1876.

Elsewhere in Australia, governors used mounted police to conduct pacification expeditions that killed thousands of Noongar and Kamilaroi people. Firearms, of course, were superior to the spear, and the warriors had no fortifications from which to oppose the advancing white

THE LAST INDIGENOUS TASMANIAN—TRUGANINI

The daughter of a Tasmanian chief, Truganini (1819–1876) led a turbulent life divided between her native culture and the advancing white settlers. Members of her family were kidnapped and murdered. Despite that, she served as an interpreter and guide to George Robinson, the chief protector of aborigines, between 1830 and 1834. She moved frequently from one place to another and became involved in several attacks upon white

settlers near Melbourne. She was the last Indigenous Tasmanian left when she died on May 8, 1876. Members of the Royal Society of Tasmania exhumed her bones two days later and put them on display in their museum. In 1976 they were finally returned and given a proper burial. She has the distinction of being the only Indigenous Tasmanian to appear on an Australian stamp.

—Robert Craig

immigrants. They resorted to guerrilla warfare tactics, avoided direct encounters, and often lay in wait to attack. The settlers retaliated with brutal repressions. In 1838, for example, a group of cattlemen set out in pursuit of a group of Indigenous Australians responsible for killing some livestock. The vigilantes happened upon a peaceful group of Kwiambal people who were generally known to be helpful to the local whites. They attacked and butchered the entire party of 28, consisting mostly of women and children, in what became known as the infamous Myall Creek Massacre. Seven of the vigilantes were brought to trial, found guilty, and hanged. It was the first time in Australia that whites were executed for the murder of indigenous persons.

Despite all of this violence, there were some sincere efforts by white settlers to aid the Indigenous Australians, but most seem to have failed. In 1814 Governor Macquarie's attempt to open a school for the children was unsuccessful, and the efforts by the Wesleyans, Anglicans, and Catholics failed because of their misunderstanding of the spiritual nature and culture of the indigenes. In the late 1830s the government created the post of "Protector of Aborigines," which gave the chief protector wide powers to oversee the well-being of the Indigenous Australians. Missions were established to educate the children, convert them to Christianity, and teach them to live like Europeans. Authorities allowed children to be forcibly removed from their natural families for education. It is estimated that between 1869 and 1969 over 100,000 children—referred to as the Stolen Generation—were thus removed and placed in separate communities. Some argued that it was for the protection of the children, while others believed that the black race could be eradicated by encouraging its assimilation and marriage within the white community. Abuses of power of mission authorities were reportedly widespread, and many believed that mission children were to be educated as servants or to work as unpaid slaves.

By the end of the nineteenth century the indigenous population had dropped to approximately 90,000, their lands had been appropriated by the Europeans, and most of the Indigenous Australians lived in areas generally unsuitable for habitation. By then, it appeared to many of

the white settlers that the indigenous population was doomed to eventual destruction.

Maori Migration in New Zealand

The internal migrations and resettlement of the Maori in New Zealand were initiated and accelerated by Western discovery and subsequent colonization. Dutchman Abel Tasman in 1692 and British captain James Cook in 1769 explored parts of the coastline. Cook established bartering relations with the Maori, or the *tangata maori* (local people), describing them as intelligent and adaptable and recommending British settlement. Originally the Maori had migrated from eastern Polynesia, perhaps the island of Raitea, to New Zealand about 1125 CE. A larger migration had arrived around 1350 CE in a fleet of canoes—*Tainui*, *Te Arawa*, *Aotea*, *Tokomaru*, *Takitimu*, *Kurabau*, and *Matatua*—and each canoe name became ancestral to a Maori tribe. The Maori settled predominantly in the North Island around the Bay Islands and along the coasts with a sparser population located on the South Island. The arrival of additional *pakeha* (European white settlers) from 1802 to 1840 to establish sealing and whaling stations along the coast on New Zealand's North Island caused forced internal migrations of Maori. Europeans built a major settlement at Kororareka (now Russell), where they processed sealskins and whale oil and repaired ships.

Initially the Maori supplied the *pakeha* with pigs, potatoes, fruit, flax, and timber around the Bay of Islands in exchange for muskets, fish

Maori chiefs recognize British sovereignty by signing the Treaty of Waitangi on May 21, 1840. Painting by A. D. McCormick. (Mary Evans Picture Library/The Image Works)

hooks, and iron implements. Muskets became an important factor when the northern tribes of Maori, especially the Ngapuhi, led by the warrior Hongi Hika from the north Auckland region, launched a series of intertribal wars known as the Musket Wars during the 1810s to 1840. Seeking *utu* (revenge) against their enemies for seizures of land and scarce resources, especially the Ngati Whatua, the northern tribes led by the Ngapuhi warred against the southern and central Maori tribes of the North Island. The conflicts caused massive migrations, as the Ngapuhi's enemies fled southward when their traditional hand-to-hand club weapons—the *patu* and the *mere*—proved no match against muskets.

Hongi Hika attacked the Ngati Maru tribe in the Thames area in 1821 and also the Ngati Paoa around Tamaki (Auckland). He attacked the Waikato tribe, headed by Te Wherowhero, in 1822 and the Arawa tribe in Rotorua in 1823; in 1825 he defeated his rivals the Ngati Whatua in the battle at Te Ika-a-ranga-nui. However, he was wounded in 1827 in an interclan siege and died in 1828. The resulting internal Maori migrations to seize new lands and resources or to evade enemies changed the tribal landscape of New Zealand, with many tribes moving into the South Island. Maori musket warfare spread from the North Island to the northern portion of the South Island when the Ngati Toa confederation attacked the Ngai Tahu, seeking additional

land and sources of greenstone (nephrite jade). Desperate Maori tribes without muskets soon obtained them by bartering embalmed human heads for them.

The Musket Wars produced an outcry from the white settlers calling for Britain's protection. Amid rumors that the French were about to colonize New Zealand, in 1833 Britain stepped in and appointed James Busby as official British resident. Busby took his post in Kororareka (which became the country's first capital) with the goal of mediating the Musket Wars.

By 1840 the Maori population had been reduced from 100,000 to 60,000 as a result of the intertribal warfare of the Musket Wars. Ten thousand had been killed in warfare, and an additional 30,000 were killed by enslavement and the introduction of foreign diseases. Internal migrations and wandering *toa* (bands of warriors) were created as alliances changed or as victors pushed forward, which in turn caused some Maori to father children outside their own tribes. This strengthened the genealogical relationships between many previously separate Maori tribes. Smaller *iwi* (tribes) such as the Muaupoko and the Rangitane were pushed out of their traditional homelands by rival coalitions. The wars allowed victorious chiefs to occupy new lands. Chief Te Rauparaha, leader of the Ngati Toa, occupied Kapiti near Wellington. Chief Ati Awa ventured to the Chatham Islands in 1835 and subdued the Moriori. Thus, the Musket Wars had introduced new and complex Maori population groupings. Moreover, many Maori had turned to Christianity amid the turmoil. Intertribal warfare had also created a longing for peace among European white settlers and the Maori, who turned to Britain to end conflicts.

The push for Britain's systematic colonization, settlement, and annexation of New Zealand was spearheaded in 1837 by the New Zealand Association, based in England and organized by Edward Gibbon Wakefield. It developed into the New Zealand Company in 1839 and encouraged British settlers to occupy the Cook Strait region, resulting in the founding of Wellington, Wanganui, and New Plymouth on the North Island and Nelson, Otago, and Canterbury on the South Island. Initially the earliest New Zealand settlements were de facto under British authority

extending from Australia's New South Wales, but British Resident James Busby favored outright British annexation and the establishment of a separate government over New Zealand.

In 1839 London's Colonial Office sent naval officer Captain William Hobson to New Zealand to negotiate sovereignty issues with the Maori chiefs. As a result of his diplomacy, British sovereignty was extended over New Zealand through the signing of the Treaty of Waitangi on February 6, 1840. Tamati Waaka Nene, the Hokianga chief, supported the treaty and convinced additional chiefs to agree by stressing the need of the Maori to live in harmony with European settlers and ensure peace. In December 1840 New Zealand became a separate British Crown colony with Hobson as governor. British leadership encouraged the settlement or seizure, through purchase or confiscation, of the most fertile Maori lands. The New Zealand Company bought 400,000 acres (161,875 hectares) from the Ngai Tahu for £2,400 in 1847. But numerous Maori continued to be forced from their lands as sheep raising became profitable, with 2 million sheep introduced by 1860.

Misunderstandings between Maori and Europeans over land titles and sovereignty issues generated by the Treaty of Waitangi gave way to open conflicts known by the British as the Maori Wars or the Land Wars of the 1840s–1860s. The treaty had been written in English and Maori, and several words—*Kawanatanga* (governorship), *Rangatiratanga* (Chieftainship), and *Taonga* (properties/valuables)—caused disputes. Eventually victorious, Britain retaliated against its opponents by confiscating some of their tribal lands such as those of the Ngai Tahu (where gold would later be discovered in the Otago-Dunedin area in 1861) on the South Island and large sections of the Waikato and Taranaki. Land alienation either through sale or confiscation confined the Maori to remote areas of New Zealand in the central North Island along its east coast and far north. In 1862 the Native Land Act legalized further sales of land between settlers and Maori. New waves of immigrants, dominated by the Scots, arrived and settled in Dunedin in the late 1850s; Cornish miners and Chinese to work in the gold mines joined them in the 1860s. By the end of the nineteenth

THE TREATY OF WAITANGI

The Treaty of Waitangi was called New Zealand's Magna Carta by the British because it protected Maori land interests in exchange for their recognition of British sovereignty. The first clause declared that Maori chiefs had signed over their full sovereignty or absolute power to Queen Victoria. The second clause guaranteed existing powers of chieftainship and protection for all natural resources held by the Maori; it also stipulated that the Maori were to offer land for sale to the Crown before selling it to private individuals (to prevent abuse of Maori rights). The third clause guaranteed Maori the rights and privileges of British subjects. A fourth clause guaranteed religious freedom. So important was this treaty that the date of its signing, February 6, 1840, now known as Waitangi Day, is celebrated as New Zealand's national birthday, although, as might be expected, it is often the focus of protest by Maori activists who believe that the Maori were duped into surrendering sovereignty.

—Barbara Bennett Peterson

century, settlers from Britain made up 96 percent of the white population, with the Scots forming 21 percent of that figure. Scandinavians, Germans, Croatians, and others made up the remaining 4 percent. By 1870 the Maori had lost most of their valuable lands (22 million hectares out of 26 million were owned by *pakeha*). But Maori passive resistance continued through an unofficial parliament (1892–1907), a council of influential Maori chiefs, and later by political activism of the Young Maori Party to lobby for socioeconomic improvements.

Native American Migrations in the United States

Native American migrations prior to European contact, as well as voluntary and involuntary

migrations between 1492 and 1750, differed significantly from the forced migrations of Native Americans between 1750 and 1914, when the general pattern was one of conquest and displacement.

During the colonial era, European powers interacted with each tribe as independent nations, and their transactions were based on the prevailing business practices of the negotiating country. France, Spain, the Netherlands, and England all traded manufactured items for goods that the Native Americans provided such as fur pelts, fish, and wild game as well as the rights for safe passage and parcels of land. By the eighteenth century, Britain had established legal precedents to deal with the tribes. These policies recognized the inherent rights of tribal nations to move about unmolested within their tribal territories and to carry out the practices of their governments and cultural traditions. In theory, taking Indian lands could be justified only through honest trade or by a justifiable war.

American Indians believed that land should be shared by those who needed the resources that the land yielded. For example, both the Chickasaw women in eastern Mississippi and the Wampanoag women in Rhode Island and Massachusetts were responsible for farming, while the men hunted nearby or as far away as was necessary, the only restrictions on their territory being the territorial boundaries of their enemies. People of European descent, in contrast, believed in individual ownership as well as government control over the land. These differing views caused continual conflict between Americans and indigenous groups. Conflict escalated in the aftermath of the American Revolution, when securing land from Native Americans became the focus of U.S. Indian policy in the form of negotiating treaties and adopting legislation to force involuntary migrations.

In 1778 the United States began to make treaties with tribes in which the tribes surrendered large tracts of land or rights of way. By 1800 many tribes had left their traditional territories and moved westward in order to avoid the expanding American settlements. During this period the Cheyenne, possibly attracted by buffalo, began migrating westward from the Minnesota River region to the Black Hills of South

Dakota, where they remained for a few years. According to tradition, after a spiritual encounter in which they received the Sacred Arrows and instructions on how to live as holy people, the Cheyenne migrated farther west into the Yellowstone River region. After a time the tribe split into two bands, with the Southern Cheyenne migrating south toward Colorado in search of wild horses and eventually drawing close to the Arapaho.

In 1800 smallpox spread along the northern Missouri River, killing many among the tribes in the region, including the Omaha. Those Omaha who survived decided to migrate westward with the intention of fighting to the death their traditional enemies, the Cheyenne, Oto, and the Pawnee. After a time the Omaha gathered strength and decided to return to their village at Omaha Creek in northeastern Nebraska. Soon the Omaha were forced to migrate farther into northeastern Nebraska to avoid the attacks from the nearby Dakota Sioux, the Ponca, and the Oto and Pawnee from the south.

Between 1814 and 1824, General Andrew Jackson negotiated 9 out of 11 treaties with the southeastern tribes. The land surrendered with these treaties gave the United States over 75 percent of Alabama and Florida as well as parts of Georgia, Tennessee, Mississippi, Kentucky, and North Carolina, but only a small number of southeastern Indians willingly migrated to western regions at this time. In the 1820s Georgia began to pass laws and implement other policies that restricted the activities of Cherokee people. Preachers were not allowed to minister in Cherokee lands without a license; Native Americans could not advocate resistance to their impending removal; and the Georgia militia destroyed their peach orchards and shut down the *Cherokee Phoenix* newspaper as well as other businesses.

In 1828 Georgia legislators found an ally in Andrew Jackson, the newly elected president. In 1830 Jackson signed the Indian Removal Act of 1830 and authorized the military to remove almost 100,000 southeastern Native Americans from their homes in Georgia, Alabama, and Florida in a forced migration to Indian Territory. Jackson's decision established a policy that gave the federal government the instrument for

INDIAN TERRITORY, 1854

➤ NATIVE AMERICANS AS SLAVE OWNERS

During the Indian Removal period of the 1830s, the Chickasaws migrated from Mississippi to Indian Territory with 1,100 slaves, the Seminole left Florida with 500 free blacks, and the Creek and Cherokee tribes both brought large numbers of slaves with them from Alabama and Georgia. By 1861 these tribes faced both internal and external conflict as the American Civil War moved into Indian Territory. Remaining neutral was impossible. Tribal leaders argued over whether they should seek the support of the Confederacy or migrate northward into Kansas.

The conflict pitted tribal leader against tribal leader and tribe against tribe. On the northern boundary of Indian Territory, Seminole chief Billy Bowlegs fought against Stand Watie, the disputed chief of the Cherokee Nation, and his Confederate supporters. Opothleyahola, an honored leader of the Muscogee Nation, leading over 5,000 Creeks, migrated north into Kansas, where his people were later joined by 3,000 more Seminole, Cherokee,

Delaware, Euchee, Choctaw, Chickasaw, and Caddo tribal refugees.

After the war James Harlan, secretary of the interior, was sent to Indian Territory with a verdict of treason against all the tribes that had supported the Confederacy, with instructions to negotiate a new treaty. The Treaty of 1866 rescinded previous treaties and forced the Cherokee, Creek, Seminole, Chickasaw, and Choctaw tribes to give land allotments and tribal citizenship to their emancipated slaves.

In 1883 an investigation by the Department of the Interior over freedman citizenship disputes within the Cherokee Nation resulted in separate citizenship rolls, with freedman citizens sharing in Indian land allotments and cash annuities. By 1915 the controversy had lapsed until 2002, when Marilyn Vann organized the Descendants of Freedmen to renew the fight for reinstatement as tribal citizens.

—Claudette Robertson

removal and relocation of every tribe within the United States. The involuntary migrations had started with removing the Choctaw from Mississippi in 1828 and continued with the Chickasaw, Creek, Cherokee, and Seminole through the 1840s.

Although the Potawatomis were originally from Wisconsin, Illinois, and Indiana, they also were forced to migrate to Kansas in the 1840s, as were the Shawnee of Ohio. By the time the last band of Seminoles was resettled in Indian Territory in 1856, the United States had entered into the first of a series of treaty negotiations for more land. All of the western Indian wars were settled by treaty negotiations that forced the Plains, Southwest, and Pacific Northwest tribes to migrate and settle on reservations located in various regions of the nation.

Early tribal migrations in California differed somewhat from those that occurred in other regions of the country. The California tribes were hunters and gatherers whose rare voluntary migrations were usually localized. Except for those hunters who crossed over into Oregon, Nevada, and Arizona on short hunting expeditions, the

California tribes generally stayed within their traditional territories. However, by 1848 when gold was discovered on the American River, the California tribes faced the same fate as other tribes. By 1864 most of the California tribes had been forced to migrate to reservations within the state. One of the few exceptions included many of the California Modocs, who, led by Captain Jack, had resisted forced removal and had been arrested and removed first to Kansas, then to Florida, and finally to Indian Territory.

During the settling of the west and after the American Civil War, the United States forced many tribes to migrate. The Nebraska Pawnee, Omaha, and Oto were all relocated to Indian Territory. The Arizona Apache, Cayuga, Seneca from the northeast, the Comanche from Texas, Cheyenne from Colorado, Delaware from the east coast, Arapaho from Idaho, and Wyandotte from Kansas were all forced to migrate to Indian Territory. The Cussata migrated to Texas, and the Navajo, Pima, Zuni, Pueblo, and New Mexico Apaches were all forced onto restricted reservations in what is now the four corners of Colorado, Utah, Arizona, and New Mexico. The

Chippewa and other Great Lakes tribes were forced onto reservations, as were all of the New England, eastern seaboard, and Pacific Northwest tribes. The Crow, Blackfeet, Sioux, and the remaining Plains tribes were escorted by the U.S. Cavalry during the forced migrations to the many reservations that had been set aside for this purpose.

These forced migrations deprived the tribes of their land, destroyed their ways of life, and led to high mortality rates. Upwards of 50 percent of the Creek and Cherokee populations as well as 15 percent of the Choctaw population died during and immediately following the relocation period. Later, around 50 percent of the Seminole people died during and after their forced migration to Indian Territory. As it was with the southeastern tribes during removal, many of the other tribes also suffered significant population losses during and after their forced migrations due to starvation, disease, and extreme weather conditions during those months of travel.

Native Peoples of Canada

In 1750, Canada was one of four French colonies on the St. Lawrence River in northeastern North America, a fur trade outpost in which native peoples held great sway and that took its name from an aboriginal word for “settlement” or “land.” In this and neighboring colonies, native peoples exerted significant control over European traders and settlers in the first centuries

of prolonged contact through their greater numbers, superior knowledge of land and its resources, and sophisticated political strategies that played the French, English, and other Europeans against each other. As the newcomers’ emphasis shifted from trade to permanent settlement, however, pressures to deal with the Indian land question arose, resulting in the Royal Proclamation of 1763. This established, in theory at least, an orderly process by which

➤ AN INDIGENOUS PLEA TO THE PREMIER OF CANADA

In 1910, chiefs of the Secwepemc, Okanogan, and Nlaka’pmux peoples of British Columbia sent a petition to Sir Wilfrid Laurier, premier of the Dominion of Canada, documenting experiences that had been shared by many of Canada’s native peoples:

“Gradually, we are becoming regarded as trespassers over a large portion of this, our country. Our old people say, How are we to live? If the government takes our food from us they must give us other food in its place. Conditions of living have been thrust on us which we did not expect, and which we consider in great measure, unnecessary and injurious. We have no grudge against the white race as a whole, nor against the settlers, but we want to have an equal chance with them of making a living.”

It would be several more decades before native people, through sweeping legal changes, shifting ideas about race and the nation, and their own activism, would begin to see a glimmer of the “equal chance” in the chiefs’ 1910 petition to the premier. In 1914, however, the everyday reality for Canada’s aboriginal people like their future looked bleak, even though they and their lands had played central roles in the development of the nation.

aboriginal title could be extinguished through treaties and purchases by the Crown.

The 1763 “proclamation line,” beyond which resettlement would be tightly controlled, was never intended to be static. In fact, it was adjusted only five years later by the Treaty of Fort Stanwix, reflecting growing numbers of English settlers after the end of the Seven Years’ War. The end of wars between colonial powers in the northern part of the continent—including the American Revolution and the War of 1812—also rendered useless many of the diplomatic strategies that had helped maintain native control over lands and resources. Meanwhile, epidemics that had begun with first contact intensified during the late eighteenth and early nineteenth centuries, and the resulting demographic losses in turn freed up the lands of what was now known as British North America to even larger numbers of newcomers.

Out of this chaos new native identities were formed, most notably that of the Métis. The descendants of French and British men and Ojibwe, Cree, Saukteaux, and other native women, the Métis created a distinct culture with its own language, Michif, and established communities throughout large swaths of central southern Canada and the northern plains of the United States. The status of the Métis remains one of the most unique (and most complex) features of Canada’s native legal and cultural landscape.

The confederation of British North America’s colonies into the Dominion of Canada between 1867 and 1873 coincided with the beginning of what became known as the Numbered Treaties, negotiated under the terms of the Proclamation of 1763. The 11 treaties, the last of which was signed in 1930, continued the appropriation of native lands within a new national context. (In British Columbia, however, most of the land was never ceded by treaty, although native peoples were placed on hundreds of tiny reserves.)

The process of aboriginal dispossession from the land in the form of treaties and the segregation of native people onto reserves were in the nineteenth century accompanied—and in many ways contradicted—by a series of policies aimed at the assimilation of native peoples into mainstream Canadian society. The most

important of these was the Indian Act of 1876, which established (and, many would argue, curtailed) the rights of legally defined Indians in Canada; for example, native women who married nonnative men lost their Indian status, as did their children. Meanwhile, other acts targeted specific cultural practices, such as the notorious 1885 law against Potlatch (a ceremony among northwestern Indians involving feasting, dancing, and the redistribution of wealth through gift giving). New institutions such as missionary-run residential schools participated in acts of repression and reeducation that are now considered by many as forms of cultural genocide. Such policies of “civilization” did not go unchallenged. Throughout Canada, aboriginal people resisted the political, economic, and cultural effects of colonialism by means both subtle and overt. Of the latter, well-known examples include a “massacre” conducted by Tsilhqot’in warriors in British Columbia in 1864 and the “rebellions” of the Métis on the prairies in 1869 and 1885.

Many Canadians have prided themselves on their nation’s “kinder and gentler colonialism” compared to the violence that dominated native-newcomer relations in the United States. However, by the early twentieth century in both nations, resettlement by nonaboriginal people had often outpaced government attempts to control it, multiple epidemics had vastly reduced native populations, and official policies of dislocation, assimilation, and disenfranchisement had eroded most aboriginal communities’ cultural traditions and political and economic autonomy. Meanwhile, interpersonal violence, particularly against native women, remained a persistent feature of Canada’s cultural landscape.

Indigenous Peoples and European Expansion in South America

Despite the expansion of Spanish and Portuguese political power throughout much of South America in the sixteenth and seventeenth centuries, groups of native peoples remained in areas outside the sphere of effective state control. During the eighteenth and nineteenth centuries, Spain and Portugal made fresh attempts to extend their political control and economic activities at the expense of Native American communities. These efforts often resulted in violent confrontations between Europeans and Native Americans and between the European powers themselves.

European moves against Native Americans during the eighteenth century at first focused on communities with preexisting ties to European culture. Roman Catholic religious orders, especially the Jesuits, had long-established mission communities around the fringes of European colonization, most notably among the Guaraní people of Paraguay. Reports of Jesuit exploitation of the natives, disputes over the border between Brazil and the Spanish colonies, and confrontations in Europe provided the Portuguese and Spanish governments with an excuse to expel the Jesuits from the colonies and seize control of the Native American communities. In this way, the European governments forced these relatively autonomous native communities to integrate into the colonial structure. Restrictions on access to labor disappeared, and government agents encouraged or used force to make the natives adopt European customs and intermarry with whites. By the time of South American independence in the 1820s, most of these communities had ceased to exist as separate entities. However, Native American communities of the Amazon basin, both in Brazil and Spanish America, continued to exist outside the sphere of state control. While successive Brazilian governments all proposed plans for the development of the interior, the vast majority of the nonnative population remained in the coastal region. The small number of Europeans and Euro-Brazilians who did migrate to the

THE CONQUEST OF THE DESERT

For most of the nineteenth century, the Argentine government sought to limit the territory of the Araucanians. Alfred Ebélot, a French engineer hired to oversee fortifications, wrote this description of the impact of the Argentine campaign of the 1870s:

“The savages’ way of fighting is not the same as in earlier times. They no longer charge with deafening shouts. Their combat is silent; only the voice of the leader is heard and the trumpet that sounds the orders. The few deserters who have taken refuge with them, plus the reinforcements who have had experience with white men who have fought in open country, have no doubt helped teach the Indians the strategy of warfare. But it is misery, above all, that has so rapidly perfected their military education. To stop them from plundering is to cut off their livelihood. Poor devils! They do what they can.”

interior went as prospectors, rubber tappers, or slave raiders. Afro-Brazilian slaves also fled into the interior, sometimes working in cooperation with Native Americans in order to avoid recapture. These communities, some of which grew to considerable size, posed a persistent threat to the government that ended only with the abolition of slavery in Brazil in 1888.

Another area of conflict was the southern cone of South America, where on both sides of the Andes various nomadic Native American communities adopted European weapons and horses to great effect. The Mapuche of Chile and the Araucanians and Tehuelche of Patagonia in particular were powerful adversaries of the Spanish, although trade and even intermarriage also took place between them. These natives established a resilient, though ill-defined, boundary between themselves and the Spanish.

SOUTH AMERICA, 1810–1914

In Chile, the Bío-Bío River south of Santiago marked the border. In Argentina the more open grasslands south of Buenos Aires witnessed a standoff between the two cultures as first Spanish and later Argentinean authorities sought to establish fortifications and permanent ranching settlements in the region, only to lose control during times of political crisis.

Conflicts between the European cultures and the Native Americans continued well into the independence period, with raids becoming increasingly frequent and violent. In 1876 the Araucanians came within 60 miles (97 kilometers) of Buenos Aires, seizing some 300,000 head of cattle and 500 prisoners. This prompted the Argentines, led by General Julio Roca, to launch the so-called Conquest of the Wilderness, a campaign similar to the Plains Indians Wars of the United States. Under Roca, the Argentinean army swept southward, driving the Araucanians and Tehuelche before them. The victorious Argentines relocated the few survivors onto reservations, and Roca himself went on to win the presidency as a reward for his success.

A similar campaign ended the independence of the Mapuche in southern Chile. Toward the end of the War of the Pacific (1879–1884), which extended Chile's northern border at the expense of Peru and Bolivia, the Mapuche rebelled against Chilean rule. This prompted the Chileans to make the final push against the Mapuche, establishing fortifications south of the Bío-Bío River and directing veteran military units against the Native Americans between 1881 and

1883. As in Argentina, the Chileans wiped out most of the Native Americans and placed the remainder onto reservations.

In both the southern cone and the Amazon basin, immigration played an important role in the process of European expansion. Following the maxim of Argentine statesman Juan Batista Alberdi that “to govern is to populate,” South American elites encouraged European immigration into these regions to spur economic growth and culturally whiten the population. Governments across South America established agencies in Europe to encourage migration to underpopulated areas. In Argentina and Chile, these newcomers provided the long-term settlement necessary to establish the permanent presence of European culture. Brazil, however, while successful in attracting Europeans, could do little to induce these new citizens to settle beyond the established settled areas. In 1914, therefore, the Amazon basin was still a wilderness zone in the eyes of the government, which established the Indian Protection Service in 1909 in order to regulate contact between Native Americans and whites.

■ Introduction: Voluntary Migration

Between 1750 and 1914, unprecedented numbers of people decided to migrate. In some cases the move was permanent; in others it lasted for only a single growing season, the months it took to dig a canal or lay a railroad line, or a few years. For some, migration involved a short journey from a rural village to a nearby industrial town; for others, it meant a long ocean voyage from England to Australia or New Zealand. The migrants had many motives and

reached their destinations in many different ways. Dissimilar in so many ways, in aggregate the experiences of these voluntary migrants reshaped cultures, permanently altered the world's ethnic and racial complexion, contributed mightily to economic growth, and changed thinking about the meaning of nationhood. Their choices and experiences are a key part of the world's history between the eighteenth century and the early twentieth century.

There were many reasons why people chose to migrate. Religion was the main reason for many Polish and Russian Jews, who migrated to western Europe and the Americas to escape the pogroms of tsarist Russia in the 1880s and 1890s. Religion also inspired the Mormons, who found a home in Utah after fleeing from persecution in Ohio, Missouri, and Illinois. Political factors were decisive for American Loyalists, who moved to Canada during the American Revolution; the aristocratic emigrés, who fled France to escape the French Revolution; and the Forty-Eighters, who after the failures of the revolutions of 1848 left Germany, Bohemia, and Hungary for the United States, Canada, and elsewhere. Others chose to migrate in response to specific localized disasters such as the failure of the potato crop in Ireland and other parts of Europe in the late 1840s. For the most part, however, the decision to migrate was a response to long-term and worldwide economic and demographic trends. Most of the emigrants from Europe and Asia were peasants or farm laborers whose economic situation deteriorated in the nineteenth century as a result of population increases, land shortages, and rising rents. In Europe, enclosure of common lands and the gradual introduction of mechanized equipment further darkened small farmers' and farm laborers' prospects.

Emigration provided an alternative. Many Asians and Europeans left the countryside for their own countries' cities, which had employment opportunities in factories, construction projects, domestic service, and a variety of jobs that required no particular training or skill. Others migrated longer distances. Two million, mainly from China and India, emigrated as indentured servants, individuals whose passage was paid for in return for two to seven years of work as laborers for land and mine owners in the West Indies, the Pacific Islands, and South America. Since the work was harsh, it was an option mainly for the poorest and most desperate. With the cost of travel decreasing, especially after the construction of railroads and the introduction of oceangoing steamships, overseas migration came within the reach of 30 million to 40 million Indians, who provided

labor in much of the British Empire, and 10 million to 15 million Chinese, who continued to migrate to Southeast Asia and now added the United States, Canada, Peru, and South Africa as destinations. The greatest source of emigration was Europe. Fifty million to 60 million Europeans left as migrants between 1840 and 1914, with approximately 30 million going to the United States and smaller numbers to Canada, South America, Australia, New Zealand, South Africa, and Siberia. By 1914 the percentage of the earth's landmass in which Europeans were a majority reached a remarkable 40 percent. This was just one of the ways in which migration changed the world in the years between 1750 and 1914.

—James H. Overfield

Indian Emigration to Africa, Trinidad, Guyana, and the Pacific

Indians have long been on the move. Well before the eighteenth century, people from the Indian subcontinent traded throughout the Indian Ocean region with societies in the southeastern Asian islands, the Arabian Peninsula, and the eastern coast of Africa. In addition to being traders and merchants, Indians for many centuries traveled to areas of eastern Asia as pilgrims and missionaries spreading Buddhism and have ruled in various parts of Southeast Asia, most significantly in Indonesia. While Indians had been on the move for more than 2,000 years, the settlement of Indian populations overseas began to occur only during the nineteenth century. Due to a confluence of historical events—the expansion of Omani power in eastern Africa, the abolition of slavery in the British Empire, and growing European competition for resources—Indians ceased from being itinerant traders, hopscotching around the coasts and islands of the Indian Ocean; they became part of the economic revival in the region complete with settled communities, first on Zanzibar island and eventually throughout coastal and then inland East Africa.

Current scholarship better reflects the fact that Indian overseas movements predated nineteenth-century British colonialism,

in contrast to older research that relegated Indian overseas migration to British initiatives alone. Previous scholarship described a triangulated relationship between the British at the apex and the Africans and Indians at the sides, a view that falsely identifies the British as agents of historical change with Africans and Indians as passive receptors or pawns. British colonial rule dramatically changed the degree and nature of Indian movements but did not always serve as progenitor. When the sultan of Oman moved his capital down eastern Africa's coastline to the island of Zanzibar in 1840, he encouraged Indian traders, who had been itinerant traders on the coast, by supporting a policy of free trade. His pro-Indian policy resulted in Indian traders' success and the general success of northwestern Indian Ocean trade.

British interventions were responsible directly, however, for changes elsewhere in the world. Following the abolition of slavery in the British Empire in 1833, British plantation owners around the world faced labor shortages. With most of India under British control at the time, British labor needs in the Caribbean, Pacific islands, and Africa coincided with British access to a labor pool in colonized India. Thus began a system of indentured labor servitude. The first Indian indentured laborers left Madras for Mauritius in 1834, immediately following the Act of Emancipation. Other laborers were recruited from all over India for indentured labor contracts in various parts of the British Empire. For instance, Indians from Calcutta began to work in British Guyana's sugar plantations in 1838, and Indians from Madras were recruited to work on Malaysia's rubber plantations in the 1840s. The largest number of Indian immigrants (close to half a million between 1834 and 1912), indentured workers as well as merchants who followed economic opportunities, went to Mauritius, followed by British Guyana, South Africa, Caribbean islands such as Trinidad, Pacific islands such as Fiji, and other Indian Ocean islands such as Réunion. Following the abolition of slavery in French and Dutch colonies, arrangements were made with British authorities to utilize Indian laborers under similar terms of indenture in other European plantation colonies. Among the

Mohandas Gandhi, leader of the Indian independence movement, lived close to two decades in Natal Province, South Africa, where as a lawyer he led a struggle to win basic civil rights for Indian immigrants. In 1899 during the Boer War, he organized an Indian ambulance corps of 1,100 men, based on his conviction that if Indians wanted rights as subjects of the British Empire, they also should fulfill their obligations. (DPA/The Image Works)

later destinations for Indian indentured workers were Kenya and Uganda in the late nineteenth century, most notably to build the Uganda Railway for the British East Africa Company, but also to work in civil service.

Unlike slavery, indentured labor consisted of wage work under specified contractual terms. The terms of the contract, length of stay, and wages varied based on the location. Indian indentured servitude in British Guyana, for instance, was based on five-year contracts, whereas the contracts to parts of the British East African territories were for three years. Like slavery, however, Indian indentured laborers endured severe working conditions such as inadequate housing conditions and long workdays, restricted movements, and lack of basic needs such as adequate food, water, and health care. Furthermore, the strategies for recruitment in India themselves indicate that indentured laborers were not always voluntary participants. Given the extreme poverty in parts of India, the notion of choice migration can be called into question. Some were kidnapped by recruiting agents or forced into indentured servitude by the dearth of agricultural possibilities in India due to floods or drought. By the beginning of World War I, the British importation of Indians

➤ INDIAN CULTURE IN EASTERN AFRICA

Cultural integration abounds in eastern Africa. With centuries of migration, trade, and settlement of diverse communities along the East African coasts, the foods, architectural designs, and even language have been marked with hints of Indian, African, and Arabic tones. Cuisine in eastern Africa reflects its pluralistic past and present. From the eating of Indian samosas, a triangular-shaped pastry filled with both potatoes and peas or with ground meat, to the ubiquity of curries, cuisine in East Africa continues to adapt into a rich fusion by incorporating elements of those who have arrived either over land or from overseas. The Indian presence also affected language. A walk down a main street in Mombasa, Nairobi, Dar es Salaam, or Kampala evokes an auditory carnival of Swahili, Gujarati, Luganda, English, and even possibly Arabic or Hindi. While Swahili is a language that has evolved via a *mélange* of historical influences, urban East Africa continues to be a cosmopolitan

linguistic region. One example is the *dukawalla* (shopkeeper). Any Indian in East Africa will tell you that the word is based on synthesizing the Hindi or Gujarati word for shop (*dukan*) and one who is associated with it (*wallah*). Any local African will say, however, that the word is Swahili, with Arabic roots. Ethnolinguists have not made any definitive conclusion about the origins of *dukawalla*. Some suggest that the word traveled to coastal East Africa from Gujarati- or Hindi-speaking Indian merchants across the northwestern Indian Ocean; others argue that the word traveled southward from Arabic-speaking Yemeni or Omani merchants and rulers, thus influencing the syncretic Swahili language. Interestingly, both Hindi and Gujarati languages have a significant influence from Persian and Arabic. Perhaps the word *dukawalla* and its etymological trajectory thus serve as a symbol of the cultural diversity of East Africa.

—Savita Nair

began to come to a close, while the French and Dutch, who imported fewer to begin with, continued until approximately 1920.

Today's overseas Indian communities are not wholly descendants of former indentured laborers. In addition to those who migrated during the twentieth century, many trace their ancestry back to Indian merchants, adventurers, and entrepreneurs who had migrated to former European colonies. In order to fulfill an economic sector untapped by Indians, Europeans, and the indigenous population, Indian entrepreneurs accompanied and followed their nineteenth-century indentured labor counterparts to serve as petty merchants, shopkeepers, and skilled and semiskilled professionals in colonial territories. Indian merchants who had historically engaged in trading activities along the Indian Ocean littoral were the predecessors to those who took advantage of other colonial needs: Indian shop owners in Mombasa, Nairobi (Kenya), Natal (South Africa), and Fiji, for example. In fact, it is often overlooked that Mohandas K. Gandhi's stay in South Africa

was prompted in 1893 by his employment as an attorney for an Indian business firm in Durban (South Africa).

Indian Diaspora in Central Asia

In the mid-sixteenth century a number of caste-based family firms located in and around the city of Multan in northwestern India began to send agents to distant markets beyond the boundaries of India, forging what would become one of the most expansive merchant diasporas of the early modern world. For more than 300 years

the Indian merchants who populated this diaspora maintained a network that stretched across much of Eurasia. These merchants were widely known for their transregional trade in a number of commodities, especially Indian cotton textiles, and also for their money-lending activities in both urban and rural markets.

The diaspora was uniform in that all the merchants were from northern India, but it was ethnically and religiously diverse. The vast majority of the Multani merchants belonged to a number of Hindu castes, including the Bohra, the Bhatia, and especially the Khatri. A smaller number of Muslim Multanis are recorded as having populated the diaspora from its earliest days. Marwari Jains and Sikhs are also known to have joined these groups in later years. Despite this diversity, Multan served as the epicenter of this diaspora from the mid-sixteenth century through the eighteenth century, when the majority of the family firms relocated to the city of Shikarpur, in Sindh. In the late eighteenth century Sindh developed as the center of what has been termed a microworld economy, held together in part by the rapid flow of people, wealth, and information throughout the expansive Shikarpuri network.

During the seventeenth century this diaspora grew to some 35,000 individuals living in an interconnected network of communities dispersed across Afghanistan, Iran, Central Asia, the Caucasus, and much of Russia. In the mid-seventeenth century the largest diaspora community was by far the one in Isfahan, the capital of Safavid Iran (1501–1736), which was home to more than 10,000 Indian merchants. Other large Indian diaspora communities were located in Kabul and Qandahar in Afghanistan, Bandar Abbas in the Persian Gulf, Bukhara in Central Asia, and the Russian port city of Astrakhan on the Caspian Sea.

By the time the diaspora emerged, the Multani firms had a well-developed system to enlist agents and prepare them for work in distant locations. Before being dispatched into the diaspora, the firm directors loaned their agents a certain amount of capital, generally in the form of a commodity for export. The agents then arranged for their commodities to be transported by caravan across the inhospitable intermediary lands. After

➤ JOSIAH HARLAN ON HINDU MERCHANTS IN AFGHANISTAN

Josiah Harlan (1799–1871) was one of the more colorful characters of the nineteenth-century Anglo-Russian Great Game, a colonial contest for markets and political power in Central Asia. Harlan earned fame as the first American adventurer to visit Afghanistan but is perhaps better known as the likely inspiration for Rudyard Kipling's classic *The Man Who Would Be King*. In 1838, Harlan led a large army of Afghan soldiers across the Hindu Kush to suppress a rebellion against the government of the Afghan amir Dost Muhammad Khan (r. 1826–1839, 1843–1863) in Kabul. From Afghanistan, Harlan traveled on to Russia and then to America where, authoring his memoirs, he recalled that he had been surprised by the ubiquitous nature of Hindu merchant-moneylenders in Central Asia.

“Wherever there is a bazaar Hindoos are a necessary part of the establishment! These people are always found amongst the buyers and sellers in all the cities of Central Asia and constitute the bankers or money changers in all commercial communities there. . . . [T]hey form an indispensable part of the population. All financial affairs are entrusted to their management.”

—Scott Levi

Josiah Harlan, *Central Asia: Personal Narrative of General Josiah Harlan, 1823–1841*, edited by Frank E. Ross (London: Luzac, 1939), 65.

several months of travel they would take up residence in a caravansary, a hostel for merchants, where they would begin selling their goods.

The Indians did not allow the cash they retrieved to sit idle as they prepared for their return home. Rather, they were trained to put their capital to work by reinvesting it in other commercial activities, most commonly in interest-earning money lending. Because many farmers depended on credit to get their crops planted, agricultural loans constituted an important and lucrative venture for the Indians. The Indian diaspora

merchants therefore operated at a critical juncture between urban and rural markets, serving their host societies by providing investment capital to facilitate agricultural production even when local peoples could not afford the initial investment. This partially explains the motivation of Muslim administrators to protect the predominantly Hindu Indian merchants and ensure that they could conduct their business in a safe and predictable climate. Typically Indian merchants spent several years in the diaspora, occasionally even decades, before returning home.

In the 1870s Konstantin von Kaufman, the governor-general of Russian colonial Central Asia, implemented a series of policies that targeted the Indian merchants in his territory, undermined their business interests, and effectively brought an end to the Indian diaspora in Central Asia. In Afghanistan, Indians maintained an active presence right up to the partition of India in 1947. In Iran, Indian commercial activities were fully disrupted by the political turmoil in the second quarter of the eighteenth century. Indians subsequently returned, however, and have been active there since.

Chinese Emigration to Southeast Asia and the Americas

Chinese emigration beyond imperial borders goes back thousands of years, with merchant and pirate activity predominating from the fifteenth century and mass chain migrations from Fujian and Guangdong characteristic of the nineteenth century. Most Chinese emigration was to Southeast Asia, but many thousands also entered transnational flows created by European empires to Africa, India, Europe and especially to

the Americas. By 1900 about 3 million Chinese lived abroad, with more than 80 percent living in Southeast Asia. The Chinese overseas are significant because of their adaptations to non-Chinese host areas, including intermarriage, their perceived nonassimilation and retention of some religious and cultural customs, and the ties of some with their home areas in mainland China.

Chinese emigration to the areas that are now considered Southeast Asia began before the Ming dynasty naval admiral Zheng He (1371–1433) sailed to Java, Thailand, Burma, and beyond. In the fifteenth century Melaka was already a major Chinese trading port. By the 1600s tens of thousands of Chinese merchants active in Manila ensured that China's goods flowed to Europe and that New World silver flowed into China.

In Southeast Asia, sojourning took place in three identifiable stages for most Chinese. The first stage was when the community was all male, and religious and nonreligious organizations were set up allowing chain migration of relatives and neighbors from particular villages. The second stage was when those men who did not return to their families in China married local wives, forming family communities that retained some cultural ties to China and enabled their sons to continue to profit from the growing China trade. The classic examples of this are known as the *peranakan* in Dutch-controlled Java and the *baba* in British Melaka. The third stage was a fresh influx of males from China, dependent on the push factors of poor economic conditions in southern China and pull factors of economic and political openness in Southeast Asia. These newcomers provided husbands for the *peranakan*, *baba*, and mestizo women and ensured continuing ties with Chinese languages and culture.

Misunderstandings and Spanish attempts to control and tax trade led to a massacre of 20,000 Chinese in Manila in the early seventeenth century. Tensions between local populations and Chinese immigrants grew and diminished based on the local situation and divergent European colonial policies in the eighteenth century and beyond. In places like Java, tensions have simmered up to the present day when the *peranakan* (local-born Chinese) have been segregated from

Europeans and indigenous peoples, whereas in the Philippines, where new immigration from China had been cut off in the middle of the eighteenth century, the Chinese mestizo became fully engaged with local concerns.

In the nineteenth century, large numbers of Chinese laborers (coolies, from mandarin *kuli*) took the place of slaves throughout the European empires in southeast Asia and the Americas to work mines and build railroads in abominable conditions, unprotected by any agreements with the Qing government of China. In most areas strict laws prohibited women from coming to ensure that the Chinese would return to China. Men who could not save enough money to return to China lived out their lives in numerous Chinatowns that often died with them. These Chinese did not have connections in China or abroad, nor did they have trading experience.

An important change around 1900 brought these people of disparate experiences to understand themselves in a new way. They became *huaqiao*, legitimized overseas Chinese nationals with a stake in China's future. In the first decade of the twentieth century, overseas Chinese nationalism reached a fever pitch as revolutionaries like Sun Yatsen, exiled reformers like Liang Qichao and Kang Youwei, and representatives of the Qing government traveled throughout the overseas Chinese communities to raise financial support for their causes.

Immigration to the United States, 1750–1820

Migration to the nascent republic helped lay the foundation for the modern United States. While immigration was largely unregulated and unrecorded between 1750 and 1820, the first laws

on immigration, naturalization, and citizenship were created in this period; their principles would serve as the cornerstones of federal legislation until the 1960s. Immigration data were not collected before the Steerage Act of 1819, which mandated the reporting of immigrants by ship captains to federal authorities. The figures on European immigration provided below are estimates. These figures do not take into consideration the forced migration of African slaves.

1750s: 64,000
 1760s: 47,000
 1770s: 15,000
 1780s–1790s:
 1800s: 80,000
 1810s: 118,000

Reliable estimates are not available for the 1780s and 1790s.

These figures alone do not convey the many complexities of immigration. Warfare, specifically the Napoleonic Wars (1800–1815) in Europe, and their North American outlier, the War of 1812, disrupted immigration patterns. Revolutions also played a part in diversifying the population of the young republic. Some 80,000 Loyalists of all ethnicities left for Canada or England as a consequence of the American War of Independence. Some 20,000 French refugees from the Haitian Revolution of 1791–1804 (almost all of the white inhabitants), conservative French citizens fleeing the excesses of the French Revolution (1789–1799), and Irish and British radicals who found little sympathy at home for their support of the French Revolution all contributed to the emerging mosaic of American ethnicities. Immigration from Europe resumed when warfare in Europe ceased in 1815; indeed, of the record 168,000 immigrants estimated to have left for the United States in the 1810s, 70 percent came in the second half of the decade. Not all immigrants elected to stay. Some of the French returned home with the establishment of the Directory in 1795, while others returned after Napoleon took power. Return migration would become more prevalent in the late 1800s.

North America was a diverse place. Even by 1750 the English and their descendants were no

➤ BENJAMIN FRANKLIN ON ETHNIC TENSIONS IN EARLY AMERICA

Tension over immigration is by no means a modern invention. In 1751, Benjamin Franklin asked

“[W]hy should the Palatine [South-West Germany] Boors be suffered to swarm into our Settlements, and by herding together establish their Language and Manners to the Exclusion of ours? Why should Pennsylvania, founded by the English, become a Colony of Aliens, who will shortly be so numerous as to Germanize us instead of our Anglifying them, and will never adopt our Language or Customs, any more than they can acquire our Complexion.

Which leads me to add one Remark: the Number of purely white People in the World is proportionably very small. All Africa is black or tawny, Asia chiefly tawny. America (exclusive of New Comers) wholly so. And in Europe, the Spaniards, Italians, French, Russians, and Swedes, are generally of what we call a swarthy Complexion; as are the Germans also, the Saxons only excepted, who with the English, make the principal Body of White People on the Face of the Earth. I could wish their Numbers were increased.”

Franklin feared that the continual influx of Germans would fundamentally alter the ethnic composition and eventually the very nature of the North American colonies. The quote illustrates a recurring theme in the history of American immigration: the fear of the unwholesome influence of the outsider on American civilization, whether presented in racial, ethnic, or religious terms.

Benjamin Franklin, *Autobiography and Other Writings*, ed. Ormond Seavey (Oxford: Oxford University Press, 1999), 252.

longer an absolute majority except in the New England colonies, though they remained the largest ethnic group overall. German-speaking immigrants comprised one-third of the population of Pennsylvania by 1760, while the Scots-Irish comprised another 30 percent of the colony. The first federal census of 1790 reported

that out of the nearly 4 million inhabitants of the United States, 48 percent were English in origin, 19 percent were African, 12 percent were Scots and Scots-Irish (Protestants), and 10 percent were German, while Swedes, Dutch, French, Irish (Catholics), and Welsh comprised the remainder. Native Americans were not counted.

Not all immigration was voluntary. The 1790 Census reported almost one person in five was of African descent, almost all of whom were slaves. Another source of involuntary migration was the deportation of convicts from Britain; up to 50,000 convicts were sent to the colonies before the American Revolution. As securing passage across the Atlantic proved beyond the means of many, more than half of all white immigrants to the colonies and the early republic came as indentured servants. Also known as redemptioners, they gave their labor for a period of five to seven years to whoever would hire them in return for transportation, food, and lodging but no money. When their term expired, they were free. Some worked in Southern fields alongside slaves, and masters often worked indentured servants more severely to exact as much labor as possible in the allotted time. Conversely, some redemptioners learned trades that could later be parlayed into a living.

Indentured servitude was a mostly British phenomenon until 1788, when Parliament extended legislation banning the emigration of skilled laborers from Britain to encompass Ireland. In 1803, the British Passenger Act limited the numbers of immigrant passengers. As the British system of indentured servitude began to wane, another group of mostly German or Swiss families became available. These families paid for a portion of their passage and were allowed a grace period after reaching the New World to complete payment. Failure to do so meant indentured servitude to cover the outstanding debt.

Why did immigrants come? Political motivations spurred some, such as the French, to emigrate. For others, the decision was born of dire need. A population explosion in Europe between 1750 and the mid-1800s combined with the early phase of the Industrial Revolution, principally in England, created surplus populations. Local disasters also contributed, such as the crop failures that drove as many as 15,000

Irish and 20,000 Germans to migrate to the United States between 1815 and 1817.

The immigration and naturalization laws of the young republic tell us much about the development and delimitation of American citizenship. The Naturalization Act of 1790, the first act to define eligibility for citizenship of the young nation, limited naturalization to “free white persons” who had resided for two years in the United States and any of their children under 21 years of age. In 1795, a new act extended the residency requirement to five years. Applicants for citizenship now had to submit a declaration of intent at least three years before submitting their formal application for citizenship.

The four acts comprising the Alien and Sedition Acts of 1798 exacted greater restrictions on immigration and migrants. The Naturalization Act of 1798 extended the residency requirement to 14 years and the declaration of intent to five years. The original wording of the Naturalization Act preventing all foreign-born people from voting or holding office was defeated in Congress. The Alien Act also authorized the president to deport any alien deemed “dangerous to the peace and safety” of the country. These measures were meant to stem the flow of immigrants and limit their gaining of political influence through naturalization. Especially targeted were French and Irish radicals, large numbers of whom were more sympathetic to the Jeffersonian-Republicans than to President Adams’s Federalists. By 1802 the measures were expired or had been repealed.

The year 1820 heralded a new era in immigration to the United States in many ways. Redemptionism as a means of immigration was coming to an end. Also coming to an end was unrecorded immigration. The year saw 17,197 arrivals documented under the Steerage Act, a figure that already by the end of the decade would seem low. The scene was set for the era of mass migration.

Immigration to the United States, 1820–1880

From 1820 to 1880 in the first great wave of migration to the young republic, approximately 10.2 million immigrants came to the United States. Originating mainly from northern Europe and the British Isles or Canada, they contributed to the rapid growth of the U.S. population in general and its urban population in particular. Immigration during this period had a major impact on American culture.

The 1820s saw only a relatively modest increase in immigration to the United States, with about 160,000 people coming in a ten-year period, as opposed to 40,000–60,000 in the previous decade. However, the character of immigration was beginning to change. Ireland replaced Great Britain as the primary source of immigrants, although the British still made up a sizable percentage. This trend continued in the 1830s and especially the 1840s as a result of the Great Potato Famine (1845–c. 1850). Millions of Irish, forced by economic privation, sought to

► THE FIRST ILLEGAL IMMIGRANTS—AFRICAN SLAVES

One group of immigrants is difficult to quantify during this period. The African slave trade became illegal in the United States in 1808. However, the high demand and subsequent high price of slaves in the South encouraged an illicit African slave trade. Pirates such as Jean Lafitte (ca.1780–ca.1826) made fortunes preying upon slave vessels hailing from other countries, especially Spain and Portugal, and selling the contraband human cargo in the markets around New Orleans. Although Portugal and Spain had assented to English pressure in 1815 to end the slave trade, almost no effort was made to enforce such a ban. As a result, many African slaves were taken first to Cuba and then from the thriving slave markets there were exported to various destinations in the New World. The slaveholding regions in the United States were prime markets for the smuggling

human cargo, as slaves often fetched three times more in the United States than they would in Cuba. Slave owners, not surprisingly, lied about the African origin of any slaves thus acquired, making census tabulations a useless tool to determine the number of African slaves who arrived during the first half of the nineteenth century. However, highly publicized cases of African slave smuggling, such as the *Amistad* case in 1839 and 1840, made clear that slave importation to the New World was still occurring despite its illegality. Some scholars estimate that 50,000 to 100,000 or more African slaves were illegally brought to the United States in the more than half a century between the ban against their importation to the United States and the end of slavery following the American Civil War.

—Gerrit Dirkmaat

create new lives by migrating to various countries. In the two decades between 1840 and 1860, more than 1.5 million Irish immigrants came to the United States. Even after the potato crop recovered in the 1850s, thousands of Irish continued to emigrate, seeking better economic opportunities and escape from oppressive English domination that allowed landlords to exploit the impoverished Irish tenant farmers, evicting those who could not pay rents. Most settled in Boston, New York, and other northern cities, although a large contingent made New Orleans their home as well, as the rapidly growing port city provided opportunities for unskilled workers.

The Irish were supplanted as the primary immigrant group by Germans during the latter half of the 1850s. Various economic difficulties, including crop failures, population pressures, the consolidation of landholdings, new farming techniques by the large landholders, and enclosure of previously public land, spurred German immigration. In addition, turmoil that existed in the German states as a result of the failed revolution of 1848 led to the immigration of thousands of German intellectuals, many of whom were leaders in establishing German-language newspapers in the United States. Although German

immigration increased in the 1850s, it had been going on for most of the century. Between 1820 and 1860, prior to the peak of German immigration, nearly 2 million Germans left Europe for the United States. German immigration steadily rose until the last decade of the nineteenth century, although there was a slight dip in the 1860s due to the American Civil War.

The Germans were a much more disparate and diverse group than the Irish. While the Irish were nearly all Catholic and enjoyed a similar shared cultural history, German newcomers included Catholics, Protestants, and Jews. Some came from the large urban areas of northern German states and Prussia, while others were from German-speaking areas of the Russian and Austrian empires. While they shared a common language, in the absence of a unified German state (Germany would not be unified until 1871) many felt no special connection to other Germans prior to their arrival in the United States, where common language bonds often forged such feelings of unity. German immigration would continue to outpace all others until the final decade of the nineteenth century.

Perhaps as many as 200,000 of the immigrant Americans classified as German between 1840 and 1880 were German-speaking Jews.

This first large-scale Jewish migration to the United States would also leave an indelible imprint in American cities. Jewish neighborhoods became common features in several large American cities.

The influx of immigrants changed the character of American cities substantially. More than half of all the residents of New York City by 1860 were immigrants. Cities such as Boston, whose population had been largely of English descent, had a different character by the mid-nineteenth century, when more than 35 percent of residents were immigrants by 1860, and two-thirds of those immigrants were Irish Catholics. Ethnic enclaves within cities became a standard feature of large cities.

The 1860s also saw a great influx of immigrants from the Scandinavian nations, with more than 100,000 coming in that decade alone. Many settled in the upper Midwest in search of fertile farmlands. Often whole villages of Norwegian or Swedish immigrants would come to America in the space of several years, a form of chain migration that often replicated the old country patterns of life in their new surroundings. Eventually, 800,000 individuals, a full one-third of Norway's population, would migrate to the United States.

Although a majority of immigrants hailed from northern Europe, Asian immigration to the west coast of North America had a major impact on that region. Chinese peasants, as gold prospectors, laborers, and small businessmen, sought the economic opportunities that they hoped post-gold rush California could afford them. In 1852 alone, more than 20,000 Chinese immigrants landed in San Francisco. While immigration to eastern cities dwarfed this figure overall, the relatively small population of California allowed Chinese immigrants to make a major impact. Although initially welcomed as cheap laborers by enterprising whites in the West, nativist racial fears steadily grew in the face of continued migrations. The first immigration barrier in American history would be raised in 1882 with the Chinese Exclusion Act, preventing any further Chinese immigration.

Fears of the rapid influx of immigrants held by the Protestant, Anglo-Saxon majority led to several nativist, or anti-immigrant, political and

social campaigns. Because most immigrants sought economic opportunities provided by the free labor economy of the North and eschewed the less opportune slave society of the South, political nativism had the greatest support in the North. Anti-immigration sentiments often turned violent, such as the anti-Irish riot in the Philadelphia area in 1844. The American Party, often referred to as the Know-Nothings, had as its primary platform anti-Catholic legislation, strict immigration restrictions, and a greatly increased period of residency before immigrants could become citizens. Although this party briefly prospered in the mid-1850s, electing several members to Congress, it would quickly be displaced by the more pressing issue of slavery in America; however, nativist feelings and sentiment would be a recurring theme in American history.

Immigration to the United States, 1880–1914

The period between 1880 and 1914 witnessed one of the largest global population shifts in human history. Advances in transportation technology, such as the steamship's superiority over the sailing ship, had the effect of shrinking the globe for travelers. Immigrants were pushed from their sending countries for a variety of reasons, from lack of opportunity in their homelands and compulsory military service to flight from famine and persecution. Peasant regions across Europe experienced overpopulation, which placed strains on the distribution of land. Many left the impoverished countryside for cities, further increasing the burden on agricultural land to provide staple crops for growing urban populations and in turn prompting the consolidation of landholdings and the closing of common lands.

► CHINESE RESTRICTION

Chinese migrants to the United States were predominantly single males, many of whom saw their sojourn in the United States as a means to accumulate money before returning home to purchase land and start a family. By 1880 the 105,000 Chinese who resided in the United States faced low pay, hazardous working conditions, and blatant racism. During periodic economic downturns the usually culturally isolated Chinatowns of the West Coast experienced sporadic anti-Chinese riots as competition for wages intensified. In 1882 Congress voted to restrict Chinese immigration for ten years and periodically renewed the legislation before making it permanent in 1902. While laborers were prohibited, merchants, teachers, students, diplomats, and travelers were exempt from exclusion. The Exclusion Laws would stand until 1943. The Chinese Exclusion Act marked the first time in American history that the United States restricted an immigrant group because of its race and class.

—Benjamin Pottruff

Emigration now became an attractive option for peasants no longer tied to the land. Pull factors also played an important role in determining the destination of emigrants, and during the 1880s corporate America began to actively recruit labor from Southern and Eastern Europe.

The United States absorbed some 33 million of the 55 million emigrants who left Europe. Italians, Hungarians, Czechs, Slovaks, Poles, Serbs,

Slovenes, Russians, Romanians, and Greeks began to arrive in the United States in dramatically larger numbers than ever before. Furthermore, these groups were more culturally distinct than earlier immigrants from Northern and Western Europe, who could expect inexpensive land and decent wages. These new immigrants entered the United States at a time when the closing of the frontier signaled the end of cheap land and when low-paying unskilled jobs in factories proliferated. While many dreamed of owning land, the vast majority of these immigrants remained trapped in teeming cities. Many new immigrants moved into cramped and congested tenements of large cities, such as New York and Chicago, where overcrowding and poor sanitary conditions appeared in stark contrast to the predominantly rural settings left behind in the Old World. Unable to acquire land or property, many immigrants competed in the vast labor markets of urban industrial cities for low wages, working long hours often in unsanitary and hazardous conditions.

Immigrants tended to settle within communities of people who had emigrated from a similar region in a process scholars have described as chain migration. These communities, although often ethnically segregated, tended to soften cultural adjustment for newcomers. Ethnic enclaves such as Little Italy became a feature of many rapidly growing urban centers. Within these communities Immigrant Aid Societies proliferated, helping newcomers with instruction in the English language and American customs while still valuing religious practices and cultural customs and maintaining native languages. However, this persistence of Old World languages and customs concerned many commentators of the day.

The massive number of immigrants arriving in the United States prompted Congress to fund a reception center to process new immigrants and screen them for undesirable qualities. In 1892 Ellis Island off the coast of New Jersey opened its doors to the huddled masses of the Atlantic world. The immigration law of 1882 gave the federal government, through the secretary of the treasury, executive authority over immigration but delegated the actual inspection of immigrants to existing state agencies. While

nothing was done to specifically exclude groups by national origin on the East Coast, the West Coast incorporated a series of restrictive measures against Chinese in 1882 and Japanese in 1907. At a time when African Americans were being disenfranchised, these early restrictive measures ensured that newcomers would be racially identifiable as white.

Further attempts at immigration restriction met with varying success. Federal legislation did impose a 50-cent head tax on all immigrants and excluded lunatics, idiots, convicts, women suspected of prostitution, any person likely to become a public charge, and people with loathsome or dangerous contagious diseases. Early attempts to impose a literacy test on new immigrants were repeatedly vetoed by Presidents Grover Cleveland, William Taft, and Woodrow Wilson. Liberal naturalization and voting laws in the United States allowed strategically situated ethnic minorities to prevent either of the major political parties from committing resolutely to the issue of immigration restriction. Minorities that blocked restriction had the additional advantage of appealing to traditional family ideals, and these claims were bolstered by business interests whose insatiable appetite for labor kept immigration restriction from becoming a political reality.

Thus, without intending to restrict immigration, the United States took a hesitant but decisive step to control it. Those who were still uneasy about the growing numbers of foreign-born persons and the role of these newcomers in American society demanded that immigrants cut their ties to the Old World and undergo a process of Americanization. In 1908 a Jewish immigrant named Israel Zangwill penned a play, *The Melting Pot*, that gave a name to the process of throwing off Old World loyalties and adopting American nationality. The outbreak of hostilities between European powers in 1914 disrupted global migration flows and proved to be a test of loyalties for many foreign-born residents of the United States. In the postwar period, the United States became a gatekeeping nation in which immigration restriction, largely based on race and nationality, ended this period of virtually unchecked immigration from Europe to the United States.

Canadian Immigration

In 1750, most of what is now Canada was occupied by First Nations groups, who had little if any direct contact with people of nonaboriginal background. By 1914, Native Canadians constituted only a small fraction of the nation's population; Canada was populated from the Atlantic to the Pacific by immigrants and their offspring from places as diverse as Scotland, Russia, Italy, West Africa, the West Indies, and China. Between 1750 and 1914, Canada's economy, physical environment, and social and political cultures underwent dramatic changes. Canada evolved into a nation of industrialized cities, which included an extensive network of national railways, a liberal democratic political structure, a comprehensive system of European-style state institutions, and evidence of large-scale land settlement (made possible by systematic First Nations land alienation). These changes were spurred on by the attitudes, ideas, and labor of hundreds of thousands of immigrants.

At the middle of the eighteenth century, First Nations groups of varied linguistic backgrounds and social and economic practices peopled Canada from coast to coast. European traders and colonists had made significant incursions in the region by this time, though the prairies and the west coast still lacked permanent European settlements. By comparison, Atlantic Canada contained well-established communities of French

THE HOME CHILDREN

Over the course of the 1870s through the 1930s, approximately 98,000 British children migrated to Canada under the auspices of various philanthropic organizations, the most famous of which was Dr. Barnardo's Homes. The Home Children, as they came to be known, were typically orphans or the products of broken and impoverished families. Upon their arrival in Canada they were distributed to rural homes, where they worked as farmhands and domestic servants. A small percentage of the children were legally adopted into their host families. In the late nineteenth century, these child migration schemes received extensive political and financial support. The idea that children corrupted by British urban squalor and unfit parents could be saved through integration into wholesome colonial rural environments, benefiting both the sending and receiving societies, appealed to Late Victorian middle-class sensibilities. However, as abuses of the system came to light and as the social climate in Canada changed, Home Children programs increasingly became the focus of criticism.

—Lisa Chilton

men and women. For a full century and a half, New France had been the focus of France's on-again, off-again, generally ineffective colonizing efforts, the most significant of which were Louis XIV's colonization endeavors during 1663–1672, when hundreds of indentured male servants and *filles du roi* (single women selected from French state institutions) were sent to the colony. For some French administrators, New France was an important colonial asset in the contest with England for imperial possessions, and thus French emigration to the region was at least sporadically supported.

The Treaty of Paris (1763) resulted in the absorption of New France into British North America, thus ending the period of French colonialism in Canada. Britain's control of this new region did not result in any immediate marked increase in immigration; British emigrants continued to head to New England and its western frontiers rather than toward the cold French-inhabited north. In the aftermath of Britain's takeover of New France, demobilized British

troops (some of whom were mercenaries from continental Europe), Scottish Highlanders (who had been cleared off the land by landowners looking to implement more lucrative farming practices), and small numbers of land-seeking New Englanders settled in the newly acquired British territory.

The onset of the American Revolution (1775–1782) stimulated British North America's largest influx of immigrants of the eighteenth century. By the late 1770s, refugees from the war-torn American colonies were streaming into Nova Scotia and Quebec at a pace that made it difficult for the fledgling British North American colonies to adequately receive them. The challenges posed by the large numbers of loyalist immigrants were further complicated by the fact that they often arrived in great need and with high expectations of state assistance born of promises made by government officials looking to undermine the American effort in the revolutionary war. The loyalist immigrants who settled in Canada during the late eighteenth century

included well-established white Americans, recent British immigrants, Native Americans, free blacks, and slaves. They represented people of a wide range of class backgrounds. Their mass settlement in areas such as New Brunswick and Upper Canada fundamentally altered the Canadian political landscape.

Immigration from Europe was limited during the late eighteenth and early nineteenth centuries due to the American Revolution and the Napoleonic Wars. However, after 1815, British immigration to British North America picked up considerably, spurred on in part by the efforts of British charities and of landlords looking to remove impoverished tenants from their estates. The potato famine (1845–c. 1850) resulted in a mass exodus of people from Ireland, thousands of whom traveled to the British North American colonies. The extreme physical and economic distress of these immigrants combined with the poor sanitary conditions of the ships on which they traveled resulted in the spread of contagious diseases among immigrants and from immigrants to their host communities. British North American governments responded by establishing new laws and taxes as well as state-run agencies and institutions through which to manage the movement of newcomers to the region.

When the British North American colonies confederated in 1867 to form an independent nation, immigration ranked as a top priority for Canada's political leaders. Opening up the Canadian west to hardworking farmers was touted by Prime Minister John A. Macdonald and others as the most likely way to boost Canada's economy and to secure for Canada the rights to the Prairies and British Columbia. However, during the 1870s and 1880s immigration did not meet the government's expectations. British immigrants continued to come to Canada but in smaller numbers than Canadian immigration promoters wished, and relatively few settled on the land. Russian Jews, Mennonites, Hungarians, and Icelanders began to arrive in Canada during these decades, fleeing from social and political persecution and/or economic hardship. Chinese immigrants, attracted by contracts to work on the railways, entered Canada in large numbers but were considered to be merely sojourners by white Canadians, who set up legal barriers to

subsequent large-scale Chinese immigration. It was not until the late 1890s, when the Canadian government began to work at actively recruiting European immigrants previously considered unattractive, that the Canadian Prairies were effectively settled and farmed.

The Canadian government's success at recruiting immigrants at the turn of the century drew hostility from conservative members of the public, who protested the creation of instant farming communities of "Galicians," the growth of urban communities of Italians and of Jews, and the arrival of people they considered to be of questionable moral and physical health. In the period preceding the First World War, immigration continued to be a priority for Canada's political leaders, and increasing numbers of immigrants entered Canada in search of better social and economic opportunities. At the same time, persistent criticism resulted in the implementation of new laws and social agencies designed to screen, monitor, and deport "undesirable" newcomers.

Migration to Latin America, 1800–1914

In the immediate aftermath of independence, many of the new republics of Latin America encouraged immigration to attract non-Iberian settlers to assist in development or nation building. Approximately 1,000 military men, including

► EMBRANQUECIMENTO AND EUROPEAN IMMIGRATION

The openness of the Brazilian state to increased European migration during the late nineteenth and early twentieth centuries was in part motivated by an ideology heavily influenced by the scientific theories of the period that argued for the racial superiority of Europeans. This ideology, known as *embranquecimento* (or *blanqueamiento* in Spanish-speaking nations where it was also present), sought to whiten the nation through increased European immigration as well as the absorption and eventual elimination of African and Native American populations through more extensive racial mixture. Consequently, Brazil encouraged greater European immigration, especially from Germany, while also restricting the immigration of Africans as well as Asians. Such policies were similar to those of the United States, which sharply curtailed non-European and even Eastern European immigration through restrictive quotas while allowing for extensive immigration of Northern and Western Europeans. However, Brazil's vision of whitening through interracial blending contrasted sharply with the implementation of laws in the United States that prohibited racial intermarriage and promoted segregation. This difference can be explained in part by the extensive historical intermarriage between Europeans, Africans, and native Brazilians. Ultimately, in the 1930s under the regime of Getúlio Vargas, the Brazilian government rescinded its favorable policies toward European immigration in reaction to increasing unionization among European immigrant workers and as part of a populist strategy to appeal to native-born Brazilians as a whole by forging a nationalist identity.

—Josef Castañeda-Liles

Irish and British volunteers who had fought in the armies of liberation, chose to remain in Latin America once independence had been achieved. In addition, peddlers, sailors, and tradesmen arrived in many of the main ports and larger cities in the 1820s. Italians exiled for revolutionary activities arrived in Argentina starting in 1820, the most celebrated being Giuseppe Garibaldi (1807–1882), the Italian patriot and soldier. A small contingent of Norwegians founded a colony in Santa Catarina in Brazil. Uruguay had one of the largest

concentrations of foreign settlers—33,000—mostly French from the Pyrenees. Two thousand Swiss came to Brazil in 1819 and founded Nova Friburgo. Chinese contract labors were brought to Cuba and Peru in large numbers in the first half of the nineteenth century.

By 1870 voluntary migrations to Latin America began to increase dramatically, and in time nearly 11 million Europeans relocated to the region. Italy was the source of 38 percent of the immigrants, followed by Spain (28 percent) and then Portugal (11 percent). France, Germany, and Russia contributed 3 percent each. Argentina received 46 percent of the immigrants, Brazil 33 percent, Cuba 14 percent, Uruguay 4 percent, and Mexico 3 percent. Overpopulation in Europe along with industrialization and urbanization contributed to the exodus of people seeking a better life in other parts of the world in this period. At the same time the United States and Latin America did not have enough labor in their native populations for the amount of work that needed to be done. To meet the demand for a larger and more qualified workforce, some countries implemented aggressive programs to promote immigration.

In Brazil the impetus for migration centered on the need for labor, partially due to the anticipated demise of African slavery. Between 1872 and 1930, 3.3 million immigrants arrived in Brazil, mostly from Italy, Portugal, and Germany. The new immigrant population was concentrated in three areas of southeastern Brazil. The largest contingent, approximately 1.7 million, settled in the state of São Paulo, while the remainder went to the city of Rio de Janeiro and the states of Paraná, Santa Catarina, and Rio Grande do Sul. By 1914 only 5 percent of Brazil's population had been born abroad (1.6 million of 30 million). However, the immigrant population was large in São Paulo (18 percent of the population) and in several other southeastern states (13 percent of the population). In addition to Europeans, Brazil encouraged immigration from Japan. By 1914 more than 100,000 Japanese had arrived, resulting in the largest concentration of Japanese outside of Japan. Brazil was also the destination for 2,000 former citizens of the short-lived Confederate States of America, who were attracted by Brazil's exotic setting and

slave-based society. Many were former plantation owners or military men who saw opportunity in Brazil.

Argentina began promoting immigration in the 1830s to encourage economic development. The intellectual and liberal leader Juan Bautista Alberdi represented Argentina's immigration policies when he proclaimed that "To govern is to populate." However, it was the surge in the European demand for Argentine beef and related products in the last quarter of the nineteenth century that brought a flood of immigrants to Argentina. Seasonal workers known as *golondrinas* (swallows) from Italy and Spain arrived to work the wheat harvest and the cattle drives. Although many returned to Europe after their seasonal work was finished, some stayed and found year-round work in Argentine meatpacking plants; as stevedores, warehousemen, or teamsters; or in other industrial or commercial pursuits. The foreign-born populations of Argentina exceeded 30 percent (2.4 million of 7.9 million) by 1914, and 44 percent lived in or near the port of Buenos Aires.

Uruguay, much like its larger neighbor Argentina, experienced a similar influx of immigrants from Italy and Spain to work primarily in the wheat fields and on sheep and cattle ranches. Starting in the 1880s until the Great Depression in 1930, approximately 640,000 immigrants arrived in the smallest of the South American republics. By 1900 the population of Montevideo, Uruguay's capital, had grown to 268,000, and half of that number were foreign-born.

European Migration to Australia, New Zealand, and Africa

Europeans have participated extensively in intercontinental migrations, with most of the migration occurring between 1830 and 1920. After 1800, economic growth in Europe could only be maintained by using international migration as a safety valve. The exodus of Europeans permitted European economies to create prosperity while escaping a situation in which economic growth was absorbed by an increase in population. By changing continents, Europeans also managed to live longer and better than their fellow Europeans who did not move. While most of the immigrants went to the Americas, a significant percentage of Europeans migrated to Africa, Australia, and New Zealand.

Great Britain, one of the major colonial powers, proved the most successful in using the export of population to establish imperial control. It also planned emigration as way of reducing the poverty rate as well as the number of troublemakers at home. The indigent, convicts, and orphaned children were shipped out to the Americas, Australia, New Zealand, Rhodesia, and South Africa.

As the remotest of the large landmasses, Australia and New Zealand were the last to be peopled by Europeans. Distance deterred free settlement. Traveling from Britain to Australia and New Zealand cost more and took longer than to anywhere in the New World. This produced sparsely populated communities and required state assistance for the working class to emigrate. By 1839 Great Britain decided that a managed system of emigration would best help it fill the Southern Hemisphere. The British government set up the Land and Emigration Board, part of the Colonial Office, to select and transport emigrants. The program was financed by the sale of land in the Australian outback. Convict transportation continued until 1840, but free emigrants were increasingly in the majority. Most were English, many were Irish, and smaller numbers came from Scotland. Southern Australia's Germans were the first bloc from continental Europe.

Convict transportations and recruitment of immigrants created an Irish presence in Australia from the opening up of the colony, but the

Bullfinch gold mine in western Australia in 1910. Gold rushes were one of several factors that encouraged migration to Australia in the nineteenth and early twentieth centuries. (The Illustrated London News Picture Library)

rise of mass emigration from Ireland to Australia is characteristic of the post-1850 period. The Potato Famine of 1845 to c. 1850 prompted panic-stricken flight. However, the 70 years following the famine period witnessed more emigration than the two centuries before 1845, with approximately 333,000 Irish settling in Australia and New Zealand. The Australian Irish were met with suspicion and hostility, partly because of their Catholicism and partly due to the convict image that was attached to them. The Australian Irish avoided urban ghettos for a widespread settlement pattern, however, that contributed to their assimilation.

Organized white settlement of New Zealand began in 1840 under the auspices of the New Zealand Company, a business dedicated to helping settle the country with British immigrants. This English venture sent 8,600 emigrants to the country during the next three years. Difficulties in completing topographical surveys led to delays with land allocation to the immigrants, while immigrant land claims conflicted with Maori title to the land. Faced with these difficulties, the New Zealand Company dissolved in 1847. Immigrants in subsequent decades came chiefly from Great Britain, although a significant influx of Germans and Scandinavians occurred during the second half of the nineteenth century. New Zealand authorities strongly opposed Irish immigration and attracted a higher percentage of Scots than Australia.

As part of the British Empire, Australia and New Zealand were largely British countries. There was comparatively little immigration from southern Europe largely because of a lack of government assistance. The earliest Italian migrants to Australia were Catholic missionaries who worked with Spanish priests among the Aborigines during the 1840s. The gold rush of the 1850s drew more Italians. Few Greek and Spanish migrants appear in records from the first half of the nineteenth century. In general, southern European immigration was minimal until the late nineteenth century. In 1891 there were about 3,900 Italians, 600 Greeks, and 1,000 Spanish, Portuguese, and French immigrants living in Australia. By 1921 there were about 7,250 Italians, 4,600 Greeks, and 1,700 Spanish, Portuguese, and French. Swedish immigration to Australia is very small and difficult to measure since many entered Australia without address-change certificates or passports prior to World War I. The first Swedes arrived in Australia between 1830 and 1850, the same time that the first free immigrants from the English lower classes arrived. The Swedes were seamen who paid their passage by working on British or Swedish ships and who had been dismissed or had deserted their ships in Australian ports. Many worked on the wharves of Sydney, Melbourne, or Adelaide. The emergence of the whaling and sealing industries also brought some Swedish seamen to Australian waters and Australian soil. Once in Australia, the Swedes had little contact with the old country and did not act as magnets for new immigrants.

South Africa did not attract British emigrants to the same extent as Australia and New Zealand. The most serious attempt to introduce immigrants came in 1820 when Great Britain planned to establish soldiers discharged after the Napoleonic wars on the Eastern Cape. However, the land proved harsh, and few emigrants were interested. The discovery of diamonds in Kimberley and gold in the Transvaal sparked British immigration to South Africa. The white population increased from 328,000 in 1875 to 1.117 million in 1904, but the Dutch remained the white majority.

The British experienced similar difficulties in trying to establish Rhodesia (present-day Zimbabwe) as a white man's country. The

► PROTECTING BRITISH EMIGRANT WOMEN

Traveler's organizations, such as the South African Colonisation Society (SACS), particularly emphasized that they could guarantee the safe passage of women. Between 1884 and 1916, at least 22,482 women emigrated to far-flung parts of the British Empire with the aid of traveler's organizations. These groups regularly warned about the danger that young women faced when they attempted to arrange their own migration. Viewed as too incompetent to manage the tasks involved in moving, women were thought to be vulnerable to falling into poverty, prostitution, and crime as a result of their migration experiences. In the article "A Journey under the Care of the SACS" in the June 1909 issue of the *Imperial Colonist*, the author highlighted the difference between unmanaged and managed migration:

"There is an idea that the departure of Colonists from the Old Country is generally attended with

a vast amount of confusion, a multitude of unwieldy bundles and packages, a crowd of ill-assorted human beings jostling one another in hopeless discomfort, tears, and boisterous attempts at fictitious merriment. . . . [It] is certainly not a true picture of colonization as conducted by any of the well-known societies now responsible for so much of the arterial blood of the British Empire—its men, women, and children. Perhaps this is especially noticeable in the work done by the Societies for the protected Emigration of women."

British under Cecil Rhodes occupied Rhodesia in 1890 and almost immediately began to encourage white immigration to the land. A parliament controlled by white British settlers gave preferences to whites in all aspects of life, including access to land, education, health, business loans, and training. Social segregation reinforced the superior position of whites in the country. Despite these advantages, Great Britain had limited success in enticing whites to move to Rhodesia. By 1904 the white population of Rhodesia stood at 68,954, almost exclusively of English heritage.

Portugal did not support emigration to the same extent as the government of Great Britain, partly because so many Portuguese left that the country suffered from the drain. Little of this emigration went to Africa, with most Portuguese opting for Brazil. Only about 50 emigrants per year embarked to Portuguese Africa during the last quarter of the nineteenth century. From 1901 to 1906 this number went up to 2,033, a modest number compared with the total average of 25,000 departures from Portugal. France, as a continuation of its rivalry with Great Britain, established colonies in Senegal, Mauritania,

Guinea, French Somaliland, Mali, Ivory Coast, Benin, Niger, and Chad. Its longest-lasting African success came in Algeria, but relatively few French settled in this country. As a result, France simply did not have the population to establish a strong grip on Algeria.

Migrant Workers and Worldwide Railroad Construction— The Navvies

The term "navvies" was originally used to describe migrant construction laborers in Britain and in many other parts of the world in the late eighteenth and nineteenth centuries. Although not all navvies were immigrants, many of the navvies were Irish or Scottish laborers who sought economic opportunities in construction in Britain, the United States, Canada, Australia, and other global destinations accessible by sea. These men would migrate throughout the world to wherever canals, railroads, and other transportation networks of the industrial revolution were needed. They lived in temporary camps alongside the work sites.

The word "navvy" is derived from "navigator," a nickname for not only the men who worked on canals at the end of the eighteenth century but also a slang term for the canals themselves. Another nickname used for navvies was "bankers," a term originally for the men who had worked on constructing seawalls. Navvies were distinguished from other laborers by the difficult and dangerous work they performed, their migrant lifestyle, and the notoriously riotous social customs in which they took part.

As the nature and technology of the public works projects changed, navvies migrated to new locations and learned new skills. First, from the 1780s to 1830, much of the work focused on excavation for canals, such as the Erie Canal in the United States. Next, from the 1830s to the 1880s, considered the heyday of the navvy, efforts turned to constructing the vast network of railroads in America and the British Empire. Their primary role in this system was one of excavation and hauling earth from one location to another. During the last phase, from the 1880s to the 1930s, workers turned their efforts to other modern public works projects such as reservoirs.

The migration of workers was both possible and necessary because most of the projects required plentiful unskilled labor. The locations of the work did not typically enjoy a large enough local population willing to do menial labor in grueling or dangerous conditions. For example, the most common form of excavation was embanking, in which the navvies moved soil to the course of the railroad tracks to build up the land where the route was too low to avoid a steep gradient. Blasting and tunneling were common tasks as well. Whether jobs were more specialized, such as bricklaying, or more menial, such as leading horses or guiding buckets of muck on cables, the conditions were generally dangerous, difficult, and temporary enough to dissuade locals from participating.

The hierarchical distribution of responsibility and reward at each work site encouraged navvies to complete their work efficiently and with quality. A system of subcontracting developed in which bosses financially penalized late projects. This pressure ensured that every worker had a stake in the success of a project. Subcontractors hired foremen, called gangers, to manage the laborers themselves. Navvies respected some gangers more than others, and for those they respected worked harder or were at least less confrontational.

Despite navvies' satisfaction in their tedious work, frustration over economic hardships or civil and religious persecution that initially drove many of the navvies to migrate created an environment of limited congeniality. The navvies valued their independence above all else. Although they were often kind to each other, they purposefully avoided befriending other navvies. To ensure this social distance, men purposefully rotated where they lived in order not to develop too close ties with one another and arranged to sleep in different dwellings than those of their co-workers. Similarly, if family members worked in the same navvy camp, they tended to live and work separately. Some of the men were independent by nature and avoided social ties because they did not wish to be obligated in any way to friends or family members. In addition, the tendency to avoid close ties might also have been related

to a sense of shame felt for the lowly nature of the work being done, regardless of the frequent boasting and bravado that accompanied their drinking.

Navvies prided themselves in being able to perform the most dangerous jobs. They tended to destroy any machines they encountered that threatened to cut out future work, even those designed to do some of the more dangerous work. In some cases an injury or a death would leave a family without a breadwinner. Although most navvies traveled without families, a minority did travel with their families. Despite navvies' usual tendency toward limited sociability, in such cases a sense of empathetic responsibility prompted navvies to contribute to funds for widows and orphans. Injured or sick navvies were also often given a sick pay supplied by other navvies.

The migrant navvy camps sprang up wherever there was work. Sometimes a contractor built the initial barracks. After those were full, navvies continued to build shanties and sod huts, or they squatted in windmills, old forges, or abandoned kilns. Labor reform movements encouraged better living conditions for the workers in the latter part of the century, and some of the camps eventually included a hospital or a school.

The communities around these locations struggled with the perception and reality of drunken fighting men. Navvies were notorious for traipsing through town and taking some of the local women with them when they left. Furthermore, ethnic tensions led to struggles for work and intense fighting. The Irish, who were perceived to work for lower pay than other groups, were often the targets of Scottish and English mobs of laborers. These battles were serious and persistent.

Despite the negative image that the navvies had in communities through which they passed, there is no doubt that they accomplished amazing feats of workmanship. They built the railroads that were the infrastructure of the British Empire and the rest of the industrialized world in the nineteenth century. Regardless of their reputed antisocial behavior, they left behind a legacy that includes invaluable seawalls, canals,

railroads, roads, viaducts, reservoirs, and even such landmark structures as the Crystal Palace.

Jewish Migration to Palestine

Oppression and persecution of the Jews in eastern Europe in the latter part of the nineteenth century gave impetus to the Zionist emigration for Palestine and led to the establishment of Petach Tikva, the first agricultural community (i.e., Zionist settlement) in Palestine in 1878. Jews accounted for 24,000 of the 400,000 residents of Palestine in 1880, but that number more than doubled after the initial wave of immigration (the First Aliya) of eastern European Zionists. These immigrants settled on small farms throughout Palestine and at first employed Arab labor. By 1895 Jews accounted for 47,000 of the 500,000 residents of Palestine and owned 0.5 percent of the land. The Jewish Colonization Association began aiding Zionist settlements in Palestine in 1896.

In 1897 Austrian-Jewish journalist Theodor Herzl convened the First Zionist Congress in Basel, Switzerland, in response to increasing European anti-Semitism following the Dreyfus Affair in France in 1894 and his call for a Jewish state in his influential short book *Der Judenstaat* (The Jewish State), published in 1896. The First Zionist Congress created the World Zionist Organization (WZO), elected Herzl as the first WZO president, authorized the WZO to establish branches in all countries with consequential Jewish populations, and determined Zionism's

goal to be the creation of a legal (guaranteed) Jewish homeland in Palestine (Israel). The WZO was formed to unite the Jewish people politically so that Judaism acting as one organic whole might exert more power in addressing the plight of world Jewry and in creating a homeland in Israel (Palestine) for Jews.

At the First Zionist Congress, the political Zionism of the Jews of western Europe merged with the settlement activities in Turkish Palestine, promoted and successfully engaged in by the eastern European Hovevei Zion, organizations that are now considered the forerunners and foundation-builders of modern *Zionism*. The WZO created companies and institutions designed to accomplish its policies, the most prominent among many being the Jewish Colonial Trust, established in 1899; the Jewish National Fund, established in 1901; the Anglo-Palestine Bank, the Jewish Colonial Trust's subsidiary, established in 1902; and Keren Hayesod (The Foundation Fund), established in 1920. The Jewish National Fund was created to acquire land in Palestine. Keren Hayesod funded Zionist and Yishuv (Jewish communities in Palestine) activities and created companies such as the Palestine Electric Company, the Palestine Potash Company, and the Anglo-Palestine Bank.

The WZO's actions promoted and facilitated the Second Aliya (literally "Ascent") between 1904 and 1914, which brought primarily secular Jews (including socialists) into Palestine and raised the Jewish population to 6 percent of the Palestinian total. The many farms and factories bought or built by the Baron Edmond de Rothschild Foundation were insufficient to employ this number of people, and so many participants in the Second Aliya eventually left Palestine.

Fearing that the publication in 1904 of "The Awakening of the Arab Nation in Turkish Asia," by the Syrian Christian Najib Azoury, which publicly warned the Arabs of the Zionist plan for Palestine, would hamper its plans, the 1904 Fourth Zionist Congress determined that there was a need for an alternative Jewish national homeland in Argentina. However, the 1906 Fifth Zionist Congress reaffirmed Palestine as the future Jewish national homeland. The Arabic-language newspaper *Al-Karmil* was founded in 1908 in Haifa with the express purpose of

opposing Zionist colonization, but this did not prevent the 1909 establishment of the first Zionist kibbutz (collective) farm. By 1910, Arabic-language newspapers in Beirut and Damascus sounded the alarm over Zionist land acquisitions and the growing Jewish population, and in 1911 the Arab newspaper *Filastin* began calling Arabs living in Palestine "Palestinians." One of the earliest books in Arabic, Najib Nassar's *Zionism: Its History, Objectives and Importance*, was also published in 1911. The Jews accounted for 85,000 (12 percent) of the 700,000 total population of Palestine by 1913, the same year the First Arab Nationalist Congress met in Paris.

All these developments set the stage for the series of steps that led to the founding of the independent state of Israel after World War II.

Nineteenth-Century Gold Rushes

Nineteenth-century gold discoveries sparked gold rushes, manias that rivaled, if not eclipsed, the major speculative crazes that have periodically rocked financial markets. England adopted the gold standard following the Napoleonic Wars, and the United States was on a de facto gold standard after 1834. The discovery of gold in California in 1848 and in Australia in 1851 increased the world's monetary gold reserves from 144 million pounds sterling in 1851 to 376 million pounds sterling in 1861, an increase of 161 percent over a ten-year period. Gold discoveries enabled the United States to become an official gold standard country. They also supplied the monetary reserves for the world to adopt

the gold standard in the last quarter of the nineteenth century. Following the gold discoveries, a silver monetary standard became the mark of a low-income country.

On January 4, 1848, James W. Marshal found gold on land in California owned by a Swiss man named Sutter. The discovery occurred nine days before the United States signed a treaty with Mexico making California, New Mexico, Arizona, Nevada, and Utah part of U.S. territory. The secret soon leaked out, though not in time to prevent the signing of the treaty, and gold fever infected the residents of San Francisco and Monterey, most of whom went straight to the gold mines, leaving their houses empty. Workers left employers, and employers decided to join their workers mining for gold. Soldiers deserted, and ship captains were afraid to make port for fear that sailors would leave for the gold mines. Some ships lay stranded in harbors, deserted by sailors who took up prospecting. Mexican miners and Native Americans were brutally and sometimes violently excluded from the search for gold. In 1850 the California legislature enacted the Foreign Miners' Tax of 1850, which put a \$20 monthly fee on foreign miners. Between 1848 and 1850 the population of San Francisco multiplied twenty-five-fold, from 1,000 to 25,000. Wages at unheard-of levels lured immigrants, who were content to leave the actual mining to others and take jobs as cooks or fill other skilled positions. The prices of life's necessities soared. Deck cabins detached from deserted ships as well as tents and wood shanties furnished housing for miners and fortune seekers.

The repercussions of the Australian gold discoveries were milder compared to the California experience. An emigrant who had already prospected in California began in 1851 searching for gold in the Northern Bathurst region of Australia, an area that geologists believed contained gold. Gold was discovered, but the mines were scattered. This factor, coupled with a well-established sheep industry, blunted the demographic effects of the strike.

The last years of the nineteenth century saw another round of gold discoveries. America's monetary gold stock more than doubled between 1890 and 1900, thanks to discoveries in Alaska, northeast Canada, and South Africa. A

new cyanide process for extracting gold from low-grade ores also added to gold production. In 1886 fortune seekers from around the world descended upon South Africa after an Australian miner, George Harrison, came upon a rocky outcrop of gold. Within a decade South Africa accounted for 23 percent of the world's gold production. What was called Ferreira's Camp went from a dusty miners' village to the largest city in South Africa. Along the way, it changed its name to Johannesburg. In 1896 gold was discovered in the Klondike area of Canada along the Yukon River, on a scale comparable to the California gold discoveries. Twelve dollars' worth of gold could be separated in a dish full of sand. Thirty thousand prospectors, crossing a mountain

range in Arctic conditions, arrived after heroic trials of endurance that could match the hardships of any expedition or human migration in history. Dawson City was born. Its resident miners held out against disease and starvation. At the depth of the misery, salt fetched its weight in gold. Gold was found in other provinces, and Canada became the world's third-largest gold producer.

Gold mining in Alaska dates back to the 1870s. In 1880, mining prospectors Joe Juneau and Richard Harris learned where to find gold from Chief Kowee, an Auk Indian who lived on Admiralty Island. Their strike touched off the Juneau gold rush and led to the founding of the city of Juneau. Another Alaskan gold rush, this one noted for lawlessness and starvation, occurred in 1886 with the discovery of gold on Franklin's Bar on the Fortymile River. The Klondike gold rush of 1896 further fueled the mania for gold in Alaska. Nome, Alaska, became the scene of a major Alaskan gold rush in 1898–1899, as did Fairbanks, Alaska, in 1901.

Under the gold standard a shortage of monetary gold stocks led to falling prices between 1875 and 1895, making gold that much more valuable. As prices fell, the scramble for gold increased in intensity. Gold discoveries eased monetary tightness, allowing prices to rise and reducing the value of gold and the intensity of the search for gold.

The Great Trek

The Great Trek, the movement of the Boers from Cape Colony to lands beyond the Orange and Vaal rivers, was an attempt to preserve a way of life that became, for their heirs, equivalent to the movement of a chosen race to their promised land. It served to reinforce not only the

conviction they had of their superiority to black Africans, but also the importance of avoiding contamination by ideas from other white people holding different views.

The willingness of the Boer population in the British colony at the Cape to tolerate the changes made between 1806 and 1836 was finite. Piet Uys, a leader of the Great Trek, said: "We have been deprived of all our domestic authority over the apprenticed coloureds in our homes and on our farms, and this has made these coloureds so insolent that we are no longer secure in our property and even our lives." It was not only the abolition of slavery in 1834, but also acts such as the enforced use of English in schools and in courts of law and the increasing shortage of land that drove them to leave the colony. From 1835, for almost ten years, some 14,000 people of Dutch descent migrated inland. In carving new territory for themselves the Voortrekkers, as they were known, encountered black Africans, some of whom were engaged in building empires of their own. Battles were fought with the Ndebele in the north by Hendrick Potgieter, and Piet Retief and Andries Pretorius struggled with the Zulu in the east. The decisive Battle of Blood River and the associated vow, known as the Covenant, exerted a deep influence on the Boer people.

The action of trekking, moving on when conditions were no longer acceptable, did not cease in the nineteenth century. In the 1920s Deneys Reitz, then a government minister, encountered Trek Boers in Angola who, dissatisfied with their treatment by the Portuguese, were driving their great ox-wagons towards the Congo.

Russian Migration to Siberia

Russian migration to Siberia was a long and slow-developing affair. Russians began crossing the Urals as early as the eleventh century to trade with natives they collectively called Iugriians. In 1582 the Cossack commander Ermak Timofeev led a small army of Cossacks and mercenaries against the Tatar khanate of Sibir, centered on present-day Tiumen. This event began Russia's lightning advance eastward, since with the khanate's demise there remained no organized polity between Moscow and the Pacific Ocean. By 1700 Cossack explorers were already in Kamchatka, and Moscow could claim a territory larger than North and South America combined. Explorers paved the way for state servitors, fugitive serfs, and exiles to follow.

The initial impetus for expansion was Moscow's dependence on the lucrative fur trade for which natives such as the Buriats, Yakuts, and Chukhchi were forced to provide tribute (*iasak*). By Peter the Great's reign (1689–1725) many fur-bearing species were already nearing extinction, so the government increasingly focused on exploiting Siberia's mineral wealth and securing the territory through colonization. Such efforts required large numbers of settlers: laborers for metallurgical works in the Urals, Altai, and Transbaikalia; soldiers to protect these sites against Kalmykh and Kirgiz armies as well as a feared invasion from China; and peasant agriculturalists to support these non-food producers.

The enservment of a growing proportion of European Russia's population discouraged emigration, however, and the autocracy accordingly responded in two ways, first by increasing the number of exiles to Siberia and second by appealing for foreign colonists. Whereas foreigners were happy to settle along the Volga and in southern Russia, few agreed to go to Siberia. As for the growing numbers of exiles, many were innocent serfs handed over by their owners in exchange for reductions against military levies and other inducements. A 1760 imperial ukase (tsar's proclamation), for example, rewarded landowners with 20 rubles for each male under the age of 15 and 10 rubles for each female. Catherine the Great (r. 1762–1796) also deported

GROWTH OF SIBERIAN POPULATION, 1763–1911

	Natives	Russians and Foreigners	Total
1763	260,000	420,000	680,000
1797	363,362	575,800	939,162
1815	434,000	1,100,500	1,534,500
1858	648,000	2,288,036	2,936,036
1897	870,536	4,889,633	5,760,169
1911	972,866	8,393,469	9,366,335

large numbers of Old Believers (Russian religious dissenters), who mostly settled in Transbaikalia and raised cattle.

During the 100-year period ending in 1917 more than 1 million people were forcibly removed to Siberia, yet the majority of exiles, convict or not, failed to become productive settlers. Some were assigned to penal labor sites in Nerchinsk and elsewhere, others were sent to penal colonies near Irkutsk and (after 1884) on Sakhalin island, but most were relegated to a squalid life in unwelcoming peasant villages. Tens of thousands belonged at any given time to the caste of vagrants known as *brodiagi*, who contributed to the region's soaring crime rates. Tsarism failed throughout its existence to ameliorate Siberia's function as the nation's prison.

Nonexiles nevertheless consistently constituted the majority of Siberia's population, which as of 1796 numbered 412,000 Russian males, some the offspring of exiles, others retired soldiers, servitors, traders, or fugitive serfs. This cohort expanded to almost 900,000 by 1815, largely owing to a demographic shift spurred by Napoleon's 1812 invasion. Serfdom continued to limit migration, however, as did bureaucratic lethargy, which explains the absence of a coherent settlement policy even after the 1861 emancipation. Logistics also proved a challenge, as Siberia lacked good roads, its rivers were often

frozen or overflowing, and huge distances had to be traversed between supply points. Migration did not appreciably accelerate until Siberia's first railroads began to appear in the 1880s.

The Trans-Siberian railroad, whose construction began in 1891 under the urging of Finance Minister Sergei Witte, improved access to the region, including especially the Russian Far East. More than 190,000 people migrated in 1896 alone. However, the railroad's many technical limitations prevented it from transferring sufficient numbers of troops during the Russo-Japanese War (1904–1905), and its economic benefits failed to meet expectations. By the time of the outbreak of the 1917 revolution, Siberia had a population of over 9 million Russians and foreigners.
